constexpr ranges::unary_transform_result<I, O>
    ranges::transform(I first1, S last1, O result, F op, Proj proj = {});
template<input_range R, weakly_incrementable O, copy_constructible F,
         class Proj = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R>, Proj>>>
constexpr ranges::unary_transform_result<borrowed_iterator_t<R>, O>
    ranges::transform(R&& r, O result, F op, Proj proj = {});
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, copy_constructible F, class Proj1 = identity,
         class Proj2 = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<I1, Proj1>,
                  projected<I2, Proj2>>>
constexpr ranges::binary_transform_result<I1, I2, O>
    ranges::transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                     F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         copy_constructible F, class Proj1 = identity, class Proj2 = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>,
                  projected<iterator_t<R2>, Proj2>>>
constexpr ranges::binary_transform_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::transform(R1&& r1, R2&& r2, O result,
                     F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});

```

1 Let:

- (1.1) — $\text{last2} \leftarrow \text{first2} + (\text{last1} - \text{first1})$ for the overloads with parameter first2 but no parameter last2 ;
- (1.2) — $N \leftarrow \text{last1} - \text{first1}$ for unary transforms, or $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ for binary transforms;
- (1.3) — E be
 - (1.3.1) — $\text{op}(*(\text{first1} + (\text{i} - \text{result})))$ for unary transforms defined in namespace `std`;
 - (1.3.2) — $\text{binary_op}(*(\text{first1} + (\text{i} - \text{result})), *(\text{first2} + (\text{i} - \text{result})))$ for binary transforms defined in namespace `std`;
 - (1.3.3) — $\text{invoke}(\text{op}, \text{invoke}(\text{proj}, *(\text{first1} + (\text{i} - \text{result}))))$ for unary transforms defined in namespace `ranges`;
 - (1.3.4) — $\text{invoke}(\text{binary_op}, \text{invoke}(\text{proj1}, *(\text{first1} + (\text{i} - \text{result}))), \text{invoke}(\text{proj2}, *(\text{first2} + (\text{i} - \text{result}))))$ for binary transforms defined in namespace `ranges`.

2 *Preconditions:* op and binary_op do not invalidate iterators or subranges, nor modify elements in the ranges

- (2.1) — $[\text{first1}, \text{first1} + N]$,
- (2.2) — $[\text{first2}, \text{first2} + N]$, and

- (2.3) — `[result, result + N]`.²¹⁶
- 3 *Effects:* Assigns through every iterator `i` in the range `[result, result + N)` a new corresponding value equal to `E`.
- 4 *Returns:*
- (4.1) — `result + N` for the overloads defined in namespace `std`.
- (4.2) — `{first1 + N, result + N}` for unary transforms defined in namespace `ranges`.
- (4.3) — `{first1 + N, first2 + N, result + N}` for binary transforms defined in namespace `ranges`.
- 5 *Complexity:* Exactly `N` applications of `op` or `binary_op`, and any projections. This requirement also applies to the overload with an `ExecutionPolicy`.
- 6 *Remarks:* `result` may be equal to `first1` or `first2`.

27.7.5 Replace

[alg.replace]

```
template<class ForwardIterator, class T>
constexpr void replace(ForwardIterator first, ForwardIterator last,
                      const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class T>
void replace(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
constexpr void replace_if(ForwardIterator first, ForwardIterator last,
                        Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T>
void replace_if(ExecutionPolicy&& exec,
                ForwardIterator first, ForwardIterator last,
                Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, class Proj = identity>
requires indirectly_writable<I, const T2&> &&
        indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>
constexpr I
    ranges::replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {});
template<input_range R, class T1, class T2, class Proj = identity>
requires indirectly_writable<iterator_t<R>, const T2&> &&
        indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>
constexpr borrowed_iterator_t<R>
    ranges::replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_writable<I, const T&>
constexpr I ranges::replace_if(I first, S last, Pred pred, const T& new_value, Proj proj = {});
template<input_range R, class T, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_writable<iterator_t<R>, const T&>
constexpr borrowed_iterator_t<R>
    ranges::replace_if(R&& r, Pred pred, const T& new_value, Proj proj = {});
```

1 Let `E` be

- (1.1) — `bool(*i == old_value)` for `replace`;
- (1.2) — `bool(pred(*i))` for `replace_if`;
- (1.3) — `bool(invoker(proj, *i) == old_value)` for `ranges::replace`;
- (1.4) — `bool(invoker(pred, invoker(proj, *i)))` for `ranges::replace_if`.

²¹⁶) The use of fully closed ranges is intentional.

- 2 *Mandates*: `new_value` is writable (25.3.1) to `first`.
 3 *Effects*: Substitutes elements referred by the iterator `i` in the range `[first, last)` with `new_value`, when `E` is true.
 4 *Returns*: `last` for the overloads in namespace `ranges`.
 5 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
    replace_copy(InputIterator first, InputIterator last,
                OutputIterator result,
                const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
    replace_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 last,
                ForwardIterator2 result,
                const T& old_value, const T& new_value);

template<class InputIterator, class OutputIterator, class Predicate, class T>
constexpr OutputIterator
    replace_copy_if(InputIterator first, InputIterator last,
                   OutputIterator result,
                   Predicate pred, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate, class T>
ForwardIterator2
    replace_copy_if(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result,
                   Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, output_iterator<const T2&> O,
         class Proj = identity>
requires indirectly_copyable<I, O> &&
    indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>
constexpr ranges::replace_copy_result<I, O>
    ranges::replace_copy(I first, S last, O result, const T1& old_value, const T2& new_value,
                         Proj proj = {});
template<input_range R, class T1, class T2, output_iterator<const T2&> O,
         class Proj = identity>
requires indirectly_copyable<iterator_t<R>, O> &&
    indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>
constexpr ranges::replace_copy_result<borrowed_iterator_t<R>, O>
    ranges::replace_copy(R&& r, O result, const T1& old_value, const T2& new_value,
                         Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class T, output_iterator<const T&> O,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
constexpr ranges::replace_copy_if_result<I, O>
    ranges::replace_copy_if(I first, S last, O result, Pred pred, const T& new_value,
                           Proj proj = {});
template<input_range R, class T, output_iterator<const T&> O, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::replace_copy_if_result<borrowed_iterator_t<R>, O>
    ranges::replace_copy_if(R&& r, O result, Pred pred, const T& new_value,
                           Proj proj = {});
```

- 6 Let `E` be
 (6.1) — `bool(*(first + (i - result)) == old_value)` for `replace_copy`;
 (6.2) — `bool(pred(*(first + (i - result))))` for `replace_copy_if`;

(6.3) — `bool(invoker(proj, *(first + (i - result))) == old_value)` for `ranges::replace_copy`;
 (6.4) — `bool(invoker(pred, invoke(proj, *(first + (i - result))))))` for `ranges::replace_copy_if`.

7 *Mandates*: The results of the expressions `*first` and `new_value` are writable (25.3.1) to `result`.
 8 *Preconditions*: The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.
 9 *Effects*: Assigns through every iterator `i` in the range `[result, result + (last - first))` a new corresponding value
 (9.1) — `new_value` if `E` is `true` or
 (9.2) — `*(first + (i - result))` otherwise.

10 *Returns*:

(10.1) — `result + (last - first)` for the overloads in namespace `std`.
 (10.2) — `{last, result + (last - first)}` for the overloads in namespace `ranges`.

11 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

27.7.6 Fill

[alg.fill]

```
template<class ForwardIterator, class T>
constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
void fill(ExecutionPolicy&& exec,
          ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator fill_n(ExecutionPolicy&& exec,
                      ForwardIterator first, Size n, const T& value);

template<class T, output_iterator<const T&> O, sentinel_for<O> S>
constexpr O ranges::fill(O first, S last, const T& value);
template<class T, output_range<const T&> R>
constexpr borrowed_iterator_t<R> ranges::fill(R&& r, const T& value);
template<class T, output_iterator<const T&> O>
constexpr O ranges::fill_n(O first, iter_difference_t<O> n, const T& value);
```

1 Let N be $\max(0, n)$ for the `fill_n` algorithms, and $last - first$ for the `fill` algorithms.
 2 *Mandates*: The expression `value` is writable (25.3.1) to the output iterator. The type `Size` is convertible to an integral type (7.3.9, 11.4.8).
 3 *Effects*: Assigns `value` through all the iterators in the range `[first, first + N)`.
 4 *Returns*: `first + N`.
 5 *Complexity*: Exactly N assignments.

27.7.7 Generate

[alg.generate]

```
template<class ForwardIterator, class Generator>
constexpr void generate(ForwardIterator first, ForwardIterator last,
                      Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Generator>
void generate(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last,
              Generator gen);

template<class OutputIterator, class Size, class Generator>
constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
ForwardIterator generate_n(ExecutionPolicy&& exec,
                           ForwardIterator first, Size n, Generator gen);
```

```

template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
    requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
    constexpr O ranges::generate(O first, S last, F gen);
template<class R, copy_constructible F>
    requires invocable<F&> && output_range<R, invoke_result_t<F&>>
    constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);
template<input_or_output_iterator O, copy_constructible F>
    requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
    constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);

```

- 1 Let N be $\max(0, n)$ for the `generate_n` algorithms, and $last - first$ for the `generate` algorithms.
- 2 *Mandates:* `Size` is convertible to an integral type ([7.3.9](#), [11.4.8](#)).
- 3 *Effects:* Assigns the result of successive evaluations of `gen()` through each iterator in the range $[first, first + N]$.
- 4 *Returns:* `first + N`.
- 5 *Complexity:* Exactly N evaluations of `gen()` and assignments.

27.7.8 Remove

[alg.remove]

```

template<class ForwardIterator, class T>
constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
                                const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
ForwardIterator remove(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      const T& value);

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
                                   Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator remove_if(ExecutionPolicy&& exec,
                        ForwardIterator first, ForwardIterator last,
                        Predicate pred);

template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
    requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
    constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class T, class Proj = identity>
    requires permutable<iterator_t<R>> &&
    indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
    constexpr borrowed_subrange_t<R>
        ranges::remove(R&& r, const T& value, Proj proj = {});
template<permutable I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
    constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
    requires permutable<iterator_t<R>>
    constexpr borrowed_subrange_t<R>
        ranges::remove_if(R&& r, Pred pred, Proj proj = {});

```

- 1 Let E be
 - (1.1) — `bool(*i == value)` for `remove`;
 - (1.2) — `bool(pred(*i))` for `remove_if`;
 - (1.3) — `bool(invoker(proj, *i) == value)` for `ranges::remove`;
 - (1.4) — `bool(invoker(pred, invoker(proj, *i)))` for `ranges::remove_if`.
- 2 *Preconditions:* For the algorithms in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements ([Table 33](#)).

3 *Effects:* Eliminates all the elements referred to by iterator *i* in the range [*first*, *last*) for which *E* holds.

4 *Returns:* Let *j* be the end of the resulting range. Returns:

(4.1) — *j* for the overloads in namespace **std**.

(4.2) — *{j, last}* for the overloads in namespace **ranges**.

5 *Complexity:* Exactly *last - first* applications of the corresponding predicate and any projection.

6 *Remarks:* Stable ([16.4.6.8](#)).

7 [*Note 1:* Each element in the range [*ret*, *last*), where *ret* is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — *end note*]

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
remove_copy(InputIterator first, InputIterator last,
           OutputIterator result, const T& value);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class T>
ForwardIterator2
remove_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 last,
            ForwardIterator2 result, const T& value);

template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator
remove_copy_if(InputIterator first, InputIterator last,
               OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate>
ForwardIterator2
remove_copy_if(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
        class Proj = identity>
requires indirectly_copyable<I, O> &&
indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr ranges::remove_copy_result<I, O>
ranges::remove_copy(I first, S last, O result, const T& value, Proj proj = {});
template<input_range R, weakly_incrementable O, class T, class Proj = identity>
requires indirectly_copyable<iterator_t<R>, O> &&
indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr ranges::remove_copy_result<borrowed_iterator_t<R>, O>
ranges::remove_copy(R&& r, O result, const T& value, Proj proj = {});
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O,
        class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
constexpr ranges::remove_copy_if_result<I, O>
ranges::remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::remove_copy_if_result<borrowed_iterator_t<R>, O>
ranges::remove_copy_if(R&& r, O result, Pred pred, Proj proj = {});
```

8 Let *E* be

(8.1) — *bool(*i == value)* for *remove_copy*;

(8.2) — *bool(pred(*i))* for *remove_copy_if*;

(8.3) — *bool(invoker(proj, *i) == value)* for *ranges::remove_copy*;

(8.4) — *bool(invoker(pred, invoker(proj, *i)))* for *ranges::remove_copy_if*.

9 Let N be the number of elements in $[first, last)$ for which E is false.

10 *Mandates*: $*first$ is writable ([25.3.1](#)) to $result$.

11 *Preconditions*: The ranges $[first, last)$ and $[result, result + (last - first))$ do not overlap.
[*Note 2*: For the overloads with an `ExecutionPolicy`, there might be a performance cost if `iterator_traits<ForwardIterator1>::value_type` does not meet the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
— *end note*]

12 *Effects*: Copies all the elements referred to by the iterator i in the range $[first, last)$ for which E is false.

13 *Returns*:

(13.1) — $result + N$, for the algorithms in namespace `std`.

(13.2) — $\{last, result + N\}$, for the algorithms in namespace `ranges`.

14 *Complexity*: Exactly $last - first$ applications of the corresponding predicate and any projection.

15 *Remarks*: Stable ([16.4.6.8](#)).

27.7.9 Unique

[alg.unique]

```
template<class ForwardIterator>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator unique(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,
                                BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator unique(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R>
ranges::unique(R&& r, C comp = {}, Proj proj = {});
```

1 Let $pred$ be `equal_to{}` for the overloads with no parameter $pred$, and let E be

(1.1) — `bool(pred(*i - 1, *i))` for the overloads in namespace `std`;

(1.2) — `bool(invoker(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace `ranges`.

2 *Preconditions*: For the overloads in namespace `std`, $pred$ is an equivalence relation and the type of $*first$ meets the *Cpp17MoveAssignable* requirements ([Table 33](#)).

3 *Effects*: For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator i in the range $[first + 1, last)$ for which E is true.

4 *Returns*: Let j be the end of the resulting range. Returns:

(4.1) — j for the overloads in namespace `std`.

(4.2) — $\{j, last\}$ for the overloads in namespace `ranges`.

5 *Complexity*: For nonempty ranges, exactly $(last - first) - 1$ applications of the corresponding predicate and no more than twice as many applications of any projection.

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last,
           OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 last,
            ForwardIterator2 result);

template<class InputIterator, class OutputIterator,
         class BinaryPredicate>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last,
           OutputIterator result, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>

            ForwardIterator1 first, ForwardIterator1 last,
            ForwardIterator2 result, BinaryPredicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
         indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
requires indirectly_copyable<I, O> &&
(forward_iterator<I> ||
 (input_iterator<O> && same_as<iter_value_t<I>, iter_value_t<O>>) ||
 indirectly_copyable_storable<I, O>)
constexpr ranges::unique_copy_result<I, O>
ranges::unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires indirectly_copyable<iterator_t<R>, O> &&
(forward_iterator<iterator_t<R> ||
 (input_iterator<O> && same_as<range_value_t<R>, iter_value_t<O>>) ||
 indirectly_copyable_storable<iterator_t<R>, O>)
constexpr ranges::unique_copy_result<borrowed_iterator_t<R>, O>
ranges::unique_copy(R&& r, O result, C comp = {}, Proj proj = {});

```

6 Let `pred` be `equal_to{}` for the overloads in namespace `std` with no parameter `pred`, and let `E` be

- (6.1) — `bool(pred(*i, *(i - 1)))` for the overloads in namespace `std`;
- (6.2) — `bool(invoker(comp, invoke(proj, *i), invoke(proj, *(i - 1))))` for the overloads in namespace `ranges`.

7 *Mandates:* `*first` is writable ([25.3.1](#)) to `result`.

8 *Preconditions:*

- (8.1) — The ranges `[first, last)` and `[result, result + (last - first))` do not overlap.
- (8.2) — For the overloads in namespace `std`:
 - (8.2.1) — The comparison function is an equivalence relation.
 - (8.2.2) — For the overloads with no `ExecutionPolicy`, let `T` be the value type of `InputIterator`. If `InputIterator` models `forward_iterator` ([25.3.4.11](#)), then there are no additional requirements for `T`. Otherwise, if `OutputIterator` meets the `Cpp17ForwardIterator` requirements and its value type is the same as `T`, then `T` meets the `Cpp17CopyAssignable` ([Table 34](#)) requirements. Otherwise, `T` meets both the `Cpp17CopyConstructible` ([Table 32](#)) and `Cpp17CopyAssignable` requirements.

[Note 1: For the overloads with an `ExecutionPolicy`, there might be a performance cost if the value type of `ForwardIterator1` does not meet both the `Cpp17CopyConstructible` and `Cpp17CopyAssignable` requirements. — end note]

9 *Effects:* Copies only the first element from every consecutive group of equal elements referred to by the iterator `i` in the range `[first, last)` for which `E` holds.

10 *Returns:*
 (10.1) — `result + N` for the overloads in namespace `std`.
 (10.2) — `{last, result + N}` for the overloads in namespace `ranges`.
 11 *Complexity:* Exactly `last - first - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

27.7.10 Reverse

[alg.reverse]

```
template<class BidirectionalIterator>
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void reverse(ExecutionPolicy&& exec,
             BidirectionalIterator first, BidirectionalIterator last);

template<bidirectional_iterator I, sentinel_for<I> S>
requires permutable<I>
constexpr I ranges::reverse(I first, S last);
template<bidirectional_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);
```

1 *Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)).
 2 *Effects:* For each non-negative integer $i < (last - first) / 2$, applies `std::iter_swap`, or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators `first + i`, `(last - i) - 1`.
 3 *Returns:* `last` for the overloads in namespace `ranges`.
 4 *Complexity:* Exactly $(last - first)/2$ swaps.

```
template<class BidirectionalIterator, class OutputIterator>
constexpr OutputIterator
reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
            OutputIterator result);
template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
ForwardIterator
reverse_copy(ExecutionPolicy&& exec,
            BidirectionalIterator first, BidirectionalIterator last,
            ForwardIterator result);

template<bidirectional_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::reverse_copy_result<I, O>
ranges::reverse_copy(I first, S last, O result);
template<bidirectional_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O>
ranges::reverse_copy(R&& r, O result);
```

5 Let N be `last - first`.
 6 *Preconditions:* The ranges `[first, last)` and `[result, result + N)` do not overlap.
 7 *Effects:* Copies the range `[first, last)` to the range `[result, result + N)` such that for every non-negative integer $i < N$ the following assignment takes place: $*(result + N - 1 - i) = *(first + i)$.
 8 *Returns:*
 (8.1) — `result + N` for the overloads in namespace `std`.
 (8.2) — `{last, result + N}` for the overloads in namespace `ranges`.
 9 *Complexity:* Exactly N assignments.

27.7.11 Rotate

[alg.rotate]

```
template<class ForwardIterator>
constexpr ForwardIterator
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
      ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::rotate(I first, I middle, S last);
```

1 *Preconditions:* [first,middle) and [middle,last) are valid ranges. For the overloads in namespace std, ForwardIterator meets the Cpp17ValueSwappable requirements (16.4.4.3), and the type of *first meets the Cpp17MoveConstructible (Table 31) and Cpp17MoveAssignable (Table 33) requirements.

2 *Effects:* For each non-negative integer $i < (last - first)$, places the element from the position first + i into position first + (i + (last - middle)) % (last - first).

[Note 1: This is a left rotate. — end note]

3 *Returns:*

- (3.1) — first + (last - middle) for the overloads in namespace std.
- (3.2) — {first + (last - middle), last} for the overload in namespace ranges.

4 *Complexity:* At most last - first swaps.

```
template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);
```

5 *Effects:* Equivalent to: return ranges::rotate(ranges::begin(r), middle, ranges::end(r));

```
template<class ForwardIterator, class OutputIterator>
```

```
constexpr OutputIterator
rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
           OutputIterator result);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
```

```
ForwardIterator2
rotate_copy(ExecutionPolicy&& exec,
           ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
           ForwardIterator2 result);
```

```
template<forward_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::rotate_copy_result<I, O>
ranges::rotate_copy(I first, I middle, S last, O result);
```

6 Let N be last - first.

7 *Preconditions:* [first,middle) and [middle,last) are valid ranges. The ranges [first,last) and [result,result + N) do not overlap.

8 *Effects:* Copies the range [first,last) to the range [result,result + N) such that for each non-negative integer $i < N$ the following assignment takes place: *(result + i) = *(first + (i + (middle - first)) % N).

9 *Returns:*

- (9.1) — result + N for the overloads in namespace std.
- (9.2) — {last, result + N} for the overload in namespace ranges.

10 *Complexity:* Exactly N assignments.

```
template<forward_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O>
```

```

ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);
11 Effects: Equivalent to:
    return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), std::move(result));

```

27.7.12 Sample

[alg.random.sample]

```

template<class PopulationIterator, class SampleIterator,
         class Distance, class UniformRandomBitGenerator>
SampleIterator sample(PopulationIterator first, PopulationIterator last,
                      SampleIterator out, Distance n,
                      UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
requires (forward_iterator<I> || random_access_iterator<O>) &&
         indirectly_copyable<I, O> &&
         uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
template<input_range R, weakly_incrementable O, class Gen>
requires (forward_range<R> || random_access_iterator<O>) &&
         indirectly_copyable<iterator_t<R>, O> &&
         uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);

```

1 *Mandates*: For the overload in namespace `std`, `Distance` is an integer type and `*first` is writable (25.3.1) to `out`.

2 *Preconditions*: `out` is not in the range `[first, last)`. For the overload in namespace `std`:

- (2.1) — `PopulationIterator` meets the *Cpp17InputIterator* requirements (25.3.5.3).
- (2.2) — `SampleIterator` meets the *Cpp17OutputIterator* requirements (25.3.5.4).
- (2.3) — `SampleIterator` meets the *Cpp17RandomAccessIterator* requirements (25.3.5.7) unless `PopulationIterator` models `forward_iterator` (25.3.4.11).
- (2.4) — `remove_reference_t<UniformRandomBitGenerator>` meets the requirements of a uniform random bit generator type (28.5.3.3).

3 *Effects*: Copies `min(last - first, n)` elements (the *sample*) from `[first, last)` (the *population*) to `out` such that each possible sample has equal probability of appearance.

[*Note 1*: Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*. — *end note*]

4 *Returns*: The end of the resulting sample range.

5 *Complexity*: $\mathcal{O}(\text{last} - \text{first})$.

6 *Remarks*:

- (6.1) — For the overload in namespace `std`, stable if and only if `PopulationIterator` models `forward_iterator`. For the first overload in namespace `ranges`, stable if and only if `I` models `forward_iterator`.
- (6.2) — To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation's source of randomness.

27.7.13 Shuffle

[alg.random.shuffle]

```

template<class RandomAccessIterator, class UniformRandomBitGenerator>
void shuffle(RandomAccessIterator first,
             RandomAccessIterator last,
             UniformRandomBitGenerator&& g);

template<random_access_iterator I, sentinel_for<I> S, class Gen>
requires permutable<I> &&
         uniform_random_bit_generator<remove_reference_t<Gen>>
I ranges::shuffle(I first, S last, Gen&& g);

```

```
template<random_access_range R, class Gen>
    requires permutable<iterator_t<R>> &&
        uniform_random_bit_generator<remove_reference_t<Gen>>
    borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

1 *Preconditions:* For the overload in namespace `std`:

(1.1) — `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

(1.2) — The type `remove_reference_t<UniformRandomBitGenerator>` meets the uniform random bit generator (28.5.3.3) requirements.

2 *Effects:* Permutes the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.

3 *Returns:* `last` for the overloads in namespace `ranges`.

4 *Complexity:* Exactly $(last - first) - 1$ swaps.

5 *Remarks:* To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation's source of randomness.

27.7.14 Shift

[alg.shift]

```
template<class ForwardIterator>
    constexpr ForwardIterator
    shift_left(ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
    ForwardIterator
    shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
    constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);
template<forward_range R>
    requires permutable<iterator_t<R>>
    constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n)

1     Preconditions:  $n \geq 0$  is true. For the overloads in namespace std, the type of *first meets the Cpp17MoveAssignable requirements.

2     Effects: If  $n == 0$  or  $n \geq last - first$ , does nothing. Otherwise, moves the element from position first + n + i into position first + i for each non-negative integer  $i < (last - first) - n$ . For the overloads without an ExecutionPolicy template parameter, does so in order starting from  $i = 0$  and proceeding to  $i = (last - first) - n - 1$ .

3     Returns: Let NEW_LAST be first + (last - first - n) if  $n < last - first$ , otherwise first.

(3.1)     — NEW_LAST for the overloads in namespace std.

(3.2)     — {first, NEW_LAST} for the overloads in namespace ranges.

4     Complexity: At most  $(last - first) - n$  assignments.

```

```
template<class ForwardIterator>
    constexpr ForwardIterator
    shift_right(ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
    ForwardIterator
    shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
    constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);
template<forward_range R>
    requires permutable<iterator_t<R>>
```

```
constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n);
```

5 *Preconditions:* $n \geq 0$ is true. For the overloads in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements, and `ForwardIterator` meets the `Cpp17BidirectionalIterator` requirements (25.3.5.6) or the `Cpp17ValueSwappable` requirements.

6 *Effects:* If $n == 0$ or $n \geq \text{last} - \text{first}$, does nothing. Otherwise, moves the element from position `first + i` into position `first + n + i` for each non-negative integer $i < (\text{last} - \text{first}) - n$. Does so in order starting from $i = (\text{last} - \text{first}) - n - 1$ and proceeding to $i = 0$ if:

- (6.1) — for the overload in namespace `std` without an `ExecutionPolicy` template parameter, `ForwardIterator` meets the `Cpp17BidirectionalIterator` requirements,
- (6.2) — for the overloads in namespace `ranges`, `I` models `bidirectional_iterator`.

7 *Returns:* Let `NEW_FIRST` be `first + n` if $n < \text{last} - \text{first}$, otherwise `last`.

- (7.1) — `NEW_FIRST` for the overloads in namespace `std`.
- (7.2) — `{NEW_FIRST, last}` for the overloads in namespace `ranges`.

8 *Complexity:* At most $(\text{last} - \text{first}) - n$ assignments or swaps.

27.8 Sorting and related operations

[alg.sorting]

27.8.1 General

[alg.sorting.general]

- 1 The operations in 27.8 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.
- 2 `Compare` is a function object type (22.10) that meets the requirements for a template parameter named `BinaryPredicate` (27.2). The return value of the function call operation applied to an object of type `Compare`, when converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms assuming an ordering relation.
- 3 For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j) != false` defaults to `*i < *j != false`. For algorithms other than those described in 27.8.4, `comp` shall induce a strict weak ordering on the values.
- 4 The term *strict* refers to the requirement of an irreflexive relation (`!comp(x, x)` for all `x`), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

- (4.1) — `comp(a, b) && comp(b, c)` implies `comp(a, c)`
- (4.2) — `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

[Note 1: Under these conditions, it can be shown that

- (4.3) — `equiv` is an equivalence relation,
- (4.4) — `comp` induces a well-defined relation on the equivalence classes determined by `equiv`, and
- (4.5) — the induced relation is a strict total ordering.

— end note]

- 5 A sequence is *sorted with respect to a comp and proj* for a comparator and projection `comp` and `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence,

```
bool(invoker(comp, invoker(proj, *(i + n)), invoker(proj, *i)))
```

is `false`.

- 6 A sequence is *sorted with respect to a comparator comp* for a comparator `comp` if it is sorted with respect to `comp` and `identity{}` (the identity projection).
- 7 A sequence `[start, finish]` is *partitioned with respect to an expression f(e)* if there exists an integer `n` such that for all $0 \leq i < (\text{finish} - \text{start})$, `f(*(start + i))` is `true` if and only if $i < n$.
- 8 In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an `operator==`, but an equivalence relation induced by the strict weak ordering. That is, two elements `a` and `b` are considered equivalent if and only if `!(a < b) && !(b < a)`.

27.8.2 Sorting

27.8.2.1 sort

[alg.sort]

[sort]

```
template<class RandomAccessIterator>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void sort(ExecutionPolicy&& exec,
          RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void sort(ExecutionPolicy&& exec,
          RandomAccessIterator first, RandomAccessIterator last,
          Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::sort(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)) and the type of `*first` meets the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17MoveAssignable* ([Table 33](#)) requirements.
- 3 *Effects*: Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns*: `last` for the overloads in namespace `ranges`.
- 5 *Complexity*: Let N be `last - first`. $\mathcal{O}(N \log N)$ comparisons and projections.

27.8.2.2 stable_sort

[stable.sort]

```
template<class RandomAccessIterator>
constexpr void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

- 2 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the `Cpp17ValueSwappable` requirements (16.4.4.3) and the type of `*first` meets the `Cpp17MoveConstructible` (Table 31) and `Cpp17MoveAssignable` (Table 33) requirements.
- 3 *Effects:* Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* Let N be $last - first$. If enough extra memory is available, $N \log(N)$ comparisons. Otherwise, at most $N \log^2(N)$ comparisons. In either case, twice as many projections as the number of comparisons.
- 6 *Remarks:* Stable (16.4.6.8).

27.8.2.3 `partial_sort`

[`partial.sort`]

```
template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
                           RandomAccessIterator middle,
                           RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
                  RandomAccessIterator first,
                  RandomAccessIterator middle,
                  RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
                           RandomAccessIterator middle,
                           RandomAccessIterator last,
                           Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
                  RandomAccessIterator first,
                  RandomAccessIterator middle,
                  RandomAccessIterator last,
                  Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* `[first, middle)` and `[middle, last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the `Cpp17ValueSwappable` requirements (16.4.4.3) and the type of `*first` meets the `Cpp17MoveConstructible` (Table 31) and `Cpp17MoveAssignable` (Table 33) requirements.
- 3 *Effects:* Places the first $middle - first$ elements from the range `[first, last)` as sorted with respect to `comp` and `proj` into the range `[first, middle)`. The rest of the elements in the range `[middle, last)` are placed in an unspecified order.
- 4 *Returns:* `last` for the overload in namespace `ranges`.
- 5 *Complexity:* Approximately $(last - first) * \log(middle - first)$ comparisons, and twice as many projections.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
6     Effects: Equivalent to:
    return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

27.8.2.4 partial_sort_copy [partial.sort.copy]

```

template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                    RandomAccessIterator result_first,
                    RandomAccessIterator result_last);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last,
                    RandomAccessIterator result_first,
                    RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
         class Compare>
constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                    RandomAccessIterator result_first,
                    RandomAccessIterator result_last,
                    Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
         class Compare>
RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last,
                    RandomAccessIterator result_first,
                    RandomAccessIterator result_last,
                    Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
    indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
constexpr ranges::partial_sort_copy_result<I1, I2>
    ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
                             Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, random_access_range R2, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
    sortable<iterator_t<R2>, Comp, Proj2> &&
    indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
                                projected<iterator_t<R2>, Proj2>>
constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
                             Proj1 proj1 = {}, Proj2 proj2 = {});

```

- 1 Let N be $\min(\text{last} - \text{first}, \text{result_last} - \text{result_first})$. Let comp be `less{}`, and proj1 and proj2 be `identity{}` for the overloads with no parameters by those names.
- 2 *Mandates:* For the overloads in namespace `std`, the expression `*first` is writable ([25.3.1](#)) to `result_-first`.
- 3 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)), the type of `*result_first` meets the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17MoveAssignable* ([Table 33](#)) requirements.
- 4 For iterators $a1$ and $b1$ in $[\text{first}, \text{last})$, and iterators $x2$ and $y2$ in $[\text{result_first}, \text{result_last})$, after evaluating the assignment $\ast y2 = \ast b1$, let E be the value of

```
bool(invoker(comp, invoke(proj1, *a1), invoke(proj2, *y2))).
```

Then, after evaluating the assignment $\ast x2 = \ast a1$, E is equal to

```
bool(invoker(comp, invoke(proj2, *x2), invoke(proj2, *y2))).
```

[*Note 1:* Writing a value from the input range into the output range does not affect how it is ordered by `comp` and `proj1` or `proj2`. — *end note*]

5 *Effects:* Places the first N elements as sorted with respect to `comp` and `proj2` into the range `[result_-first, result_first + N]`.
 6 *Returns:*
 (6.1) — `result_first + N` for the overloads in namespace `std`.
 (6.2) — `{last, result_first + N}` for the overloads in namespace `ranges`.
 7 *Complexity:* Approximately $(last - first) * \log N$ comparisons, and twice as many projections.

27.8.2.5 `is_sorted`

[`is.sorted`]

```
template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);

1     Effects: Equivalent to: return is_sorted_until(first, last) == last;

template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);

2     Effects: Equivalent to:  

        return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                       Compare comp);

3     Effects: Equivalent to: return is_sorted_until(first, last, comp) == last;

template<class ExecutionPolicy, class ForwardIterator, class Compare>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);

4     Effects: Equivalent to:  

        return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(R&& r, Comp comp = {}, Proj proj = {});

5     Effects: Equivalent to: return ranges::is_sorted_until(first, last, comp, proj) == last;

template<class ForwardIterator>
constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last,
                   Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last,
                   Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
```

```

template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});

```

6 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

7 >Returns: The last iterator `i` in `[first, last]` for which the range `[first, i)` is sorted with respect to `comp` and `proj`.

8 Complexity: Linear.

27.8.3 Nth element

[alg.nth.element]

```

template<class RandomAccessIterator>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                           RandomAccessIterator last);

```

```

template<class ExecutionPolicy, class RandomAccessIterator>
void nth_element(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator nth,
                 RandomAccessIterator last);

```

```

template<class RandomAccessIterator, class Compare>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                           RandomAccessIterator last, Compare comp);

```

```

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void nth_element(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator nth,
                 RandomAccessIterator last, Compare comp);

```

```

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});

```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 Preconditions: `[first, nth)` and `[nth, last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the `Cpp17ValueSwappable` requirements (16.4.4.3), and the type of `*first` meets the `Cpp17MoveConstructible` (Table 31) and `Cpp17MoveAssignable` (Table 33) requirements.

3 Effects: After `nth_element` the element in the position pointed to by `nth` is the element that would be in that position if the whole range were sorted with respect to `comp` and `proj`, unless `nth == last`. Also for every iterator `i` in the range `[first, nth)` and every iterator `j` in the range `[nth, last)` it holds that: `bool(invoker(comp, invoke(proj, *j), invoke(proj, *i)))` is false.

4 >Returns: `last` for the overload in namespace `ranges`.

5 Complexity: For the overloads with no `ExecutionPolicy`, linear on average. For the overloads with an `ExecutionPolicy`, $\mathcal{O}(N)$ applications of the predicate, and $\mathcal{O}(N \log N)$ swaps, where $N = last - first$.

```

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});

```

6 Effects: Equivalent to:

```

return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);

```

27.8.4 Binary search

[alg.binary.search]

27.8.4.1 General

[alg.binary.search.general]

- ¹ All of the algorithms in 27.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be

logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

27.8.4.2 lower_bound

[lower_bound]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
            const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
            const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
         ranges::less>
constexpr borrowed_iterator_t<R>
ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
- 2 *Preconditions:* The elements `e` of $[first, last)$ are partitioned with respect to the expression `bool(invoker(comp, invoke(proj, e), value))`.
- 3 *Returns:* The furthermost iterator `i` in the range $[first, last]$ such that for every iterator `j` in the range $[first, i)$, `bool(invoker(comp, invoke(proj, *j), value))` is true.
- 4 *Complexity:* At most $\log_2(last - first) + \mathcal{O}(1)$ comparisons and projections.

27.8.4.3 upper_bound

[upper_bound]

```
template<class ForwardIterator, class T>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
            const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
            const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
         ranges::less>
constexpr borrowed_iterator_t<R>
ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
- 2 *Preconditions:* The elements `e` of $[first, last)$ are partitioned with respect to the expression `!bool(invoker(comp, value, invoke(proj, e)))`.
- 3 *Returns:* The furthermost iterator `i` in the range $[first, last]$ such that for every iterator `j` in the range $[first, i)$, `!bool(invoker(comp, value, invoke(proj, *j)))` is true.
- 4 *Complexity:* At most $\log_2(last - first) + \mathcal{O}(1)$ comparisons and projections.

27.8.4.4 equal_range

[equal.range]

```
template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value,
            Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr subrange<I>
ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
         ranges::less>
constexpr borrowed_subrange_t<R>
ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
- 2 *Preconditions:* The elements `e` of `[first, last)` are partitioned with respect to the expressions `bool(invoker(comp, invoke(proj, e), value))` and `!bool(invoker(comp, value, invoke(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.
- 3 *Returns:*
 - (3.1) — For the overloads in namespace `std`:
`{lower_bound(first, last, value, comp), upper_bound(first, last, value, comp)}`
 - (3.2) — For the overloads in namespace `ranges`:
`{ranges::lower_bound(first, last, value, comp, proj), ranges::upper_bound(first, last, value, comp, proj)}`
- 4 *Complexity:* At most $2 * \log_2(\text{last} - \text{first}) + \mathcal{O}(1)$ comparisons and projections.

27.8.4.5 binary_search

[binary.search]

```
template<class ForwardIterator, class T>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
              const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
              const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
                                     Proj proj = {});

template<forward_range R, class T, class Proj = identity,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
         ranges::less>
constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},
                                     Proj proj = {});
```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
- 2 *Preconditions:* The elements `e` of `[first, last)` are partitioned with respect to the expressions `bool(invoker(comp, invoke(proj, e), value))` and `!bool(invoker(comp, value, invoke(proj, e)))`.

`e))`). Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 >Returns: `true` if and only if for some iterator `i` in the range `[first, last)`, `!bool(invoker(comp, invoke(proj, *i), value)) && !bool(invoker(comp, value, invoke(proj, *i)))` is `true`.

4 `Complexity`: At most $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$ comparisons and projections.

27.8.5 Partitions

[alg.partitions]

```
template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});
```

1 Let `proj` be `identity{}` for the overloads with no parameter named `proj`.

2 >Returns: `true` if and only if the elements `e` of `[first, last)` are partitioned with respect to the expression `bool(invoker(pred, invoke(proj, e)))`.

3 `Complexity`: Linear. At most `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition(ForwardIterator first, ForwardIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator
partition(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I>
ranges::partition(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R>
ranges::partition(R&& r, Pred pred, Proj proj = {});
```

4 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let `E(x)` be `bool(invoker(pred, invoke(proj, x)))`.

5 `Preconditions`: For the overloads in namespace `std`, `ForwardIterator` meets the `Cpp17ValueSwappable` requirements ([16.4.4.3](#)).

6 `Effects`: Places all the elements `e` in `[first, last)` that satisfy `E(e)` before all the elements that do not.

7 >Returns: Let `i` be an iterator such that `E(*j)` is `true` for every iterator `j` in `[first, i)` and `false` for every iterator `j` in `[i, last)`. Returns:

(7.1) — `i` for the overloads in namespace `std`.

(7.2) — `{i, last}` for the overloads in namespace `ranges`.

8 `Complexity`: Let $N = \text{last} - \text{first}$:

(8.1) — For the overload with no `ExecutionPolicy`, exactly N applications of the predicate and projection.

At most $N/2$ swaps if the type of `first` meets the `Cpp17BidirectionalIterator` requirements for the overloads in namespace `std` or models `bidirectional_iterator` for the overloads in namespace `ranges`, and at most N swaps otherwise.

- (8.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class BidirectionalIterator, class Predicate>
BidirectionalIterator
    constexpr stable_partition(BidirectionalIterator first, BidirectionalIterator last,
                                Predicate pred);
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
BidirectionalIterator
    stable_partition(ExecutionPolicy&& exec,
                    BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
requires permutable<I>
constexpr subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});
template<bidirectional_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});
```

9 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let `E(x)` be `bool(invoker(pred, invoke(proj, x)))`.

10 *Preconditions:* For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements ([16.4.4.3](#)) and the type of `*first` meets the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17MoveAssignable* ([Table 33](#)) requirements.

11 *Effects:* Places all the elements `e` in `[first, last)` that satisfy `E(e)` before all the elements that do not. The relative order of the elements in both groups is preserved.

12 *Returns:* Let `i` be an iterator such that for every iterator `j` in `[first, i)`, `E(*j)` is `true`, and for every iterator `j` in the range `[i, last)`, `E(*j)` is `false`. Returns:

- (12.1) — `i` for the overloads in namespace `std`.
 (12.2) — `{i, last}` for the overloads in namespace `ranges`.

13 *Complexity:* Let $N = \text{last} - \text{first}$:

- (13.1) — For the overloads with no `ExecutionPolicy`, at most $N \log_2 N$ swaps, but only $\mathcal{O}(N)$ swaps if there is enough extra memory. Exactly N applications of the predicate and projection.
 (13.2) — For the overload with an `ExecutionPolicy`, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class InputIterator, class OutputIterator1, class OutputIterator2, class Predicate>
constexpr pair<OutputIterator1, OutputIterator2>
    partition_copy(InputIterator first, InputIterator last,
                   OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1,
         class ForwardIterator2, class Predicate>
pair<ForwardIterator1, ForwardIterator2>
    partition_copy(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last,
                   ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O1> && indirectly_copyable<I, O2>
constexpr ranges::partition_copy_result<I, O1, O2>
    ranges::partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
                           Proj proj = {});
template<input_range R, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O1> &&
    indirectly_copyable<iterator_t<R>, O2>
```

```
constexpr ranges::partition_copy_result<borrowed_iterator_t<R>, 01, 02>
    ranges::partition_copy(R&& r, 01 out_true, 02 out_false, Pred pred, Proj proj = {});
```

14 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoker(pred, invoke(proj, x)))`.

15 *Mandates:* For the overloads in namespace `std`, the expression `*first` is writable (25.3.1) to `out_true` and `out_false`.

16 *Preconditions:* The input range and output ranges do not overlap.

[*Note 1:* For the overload with an `ExecutionPolicy`, there might be a performance cost if `first`'s value type does not meet the *Cpp17CopyConstructible* requirements. — *end note*]

17 *Effects:* For each iterator `i` in $[first, last)$, copies `*i` to the output range beginning with `out_true` if $E(*i)$ is `true`, or to the output range beginning with `out_false` otherwise.

18 *Returns:* Let `o1` be the end of the output range beginning at `out_true`, and `o2` the end of the output range beginning at `out_false`. Returns

(18.1) — $\{o1, o2\}$ for the overloads in namespace `std`.

(18.2) — $\{last, o1, o2\}$ for the overloads in namespace `ranges`.

19 *Complexity:* Exactly $last - first$ applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
    partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});
```

```
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
    ranges::partition_point(R&& r, Pred pred, Proj proj = {});
```

20 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoker(pred, invoke(proj, x)))`.

21 *Preconditions:* The elements `e` of $[first, last)$ are partitioned with respect to $E(e)$.

22 *Returns:* An iterator `mid` such that $E(*i)$ is `true` for all iterators `i` in $[first, mid)$, and `false` for all iterators `i` in $[mid, last)$.

23 *Complexity:* $\mathcal{O}(\log(last - first))$ applications of `pred` and `proj`.

27.8.6 Merge

[alg.merge]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
    merge(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
    merge(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result);
```

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
    merge(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result, Compare comp);
```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity,
         class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<I1, I2, O>
ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::merge(R1&& r1, R2&& r2, O result,
              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let  $N$  be  $(last1 - first1) + (last2 - first2)$ . Let comp be less{}, proj1 be identity{}, and
   proj2 be identity{}, for the overloads with no parameters by those names.
2 Preconditions: The ranges  $[first1, last1]$  and  $[first2, last2]$  are sorted with respect to comp and
   proj1 or proj2, respectively. The resulting range does not overlap with either of the original ranges.
3 Effects: Copies all the elements of the two ranges  $[first1, last1]$  and  $[first2, last2]$  into the range
    $[result, result\_last]$ , where result\_last is  $result + N$ . If an element  $a$  precedes  $b$  in an input
   range,  $a$  is copied into the output range before  $b$ . If  $e1$  is an element of  $[first1, last1]$  and  $e2$  is
   of  $[first2, last2]$ ,  $e2$  is copied into the output range before  $e1$  if and only if bool(invoker(comp,
   invoker(proj2, e2), invoker(proj1, e1))) is true.
4 Returns:
  (4.1) — result_last for the overloads in namespace std.
  (4.2) — {last1, last2, result_last} for the overloads in namespace ranges.
5 Complexity:
  (5.1) — For the overloads with no ExecutionPolicy, at most  $N - 1$  comparisons and applications of each
        projection.
  (5.2) — For the overloads with an ExecutionPolicy,  $\mathcal{O}(N)$  comparisons.
6 Remarks: Stable (16.4.6.8).

template<class BidirectionalIterator>
constexpr void inplace_merge(BidirectionalIterator first,
                            BidirectionalIterator middle,
                            BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec,
                  BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr void inplace_merge(BidirectionalIterator first,
                            BidirectionalIterator middle,
                            BidirectionalIterator last, Compare comp);
template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec,
                  BidirectionalIterator first,
                  BidirectionalIterator middle,
                  BidirectionalIterator last, Compare comp);

```

```

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});

7   Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

8   Preconditions: [first, middle) and [middle, last) are valid ranges sorted with respect to comp and proj. For the overloads in namespace std, BidirectionalIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 31) and Cpp17MoveAssignable (Table 33) requirements.

9   Effects: Merges two sorted consecutive ranges [first, middle) and [middle, last), putting the result of the merge into the range [first, last). The resulting range is sorted with respect to comp and proj.

10  Returns: last for the overload in namespace ranges.

11  Complexity: Let  $N = \text{last} - \text{first}$ :
    — For the overloads with no ExecutionPolicy, and if enough additional memory is available, exactly  $N - 1$  comparisons.
    — Otherwise,  $\mathcal{O}(N \log N)$  comparisons.

12  In either case, twice as many projections as comparisons.

13  Remarks: Stable (16.4.6.8).
```

```

template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});

13  Effects: Equivalent to:
    return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

27.8.7 Set operations on sorted structures

[alg.set.operations]

27.8.7.1 General

[alg.set.operations.general]

- Subclause [27.8.7](#) defines all the basic set operations on sorted structures. They also work with `multisets` ([24.4.7](#)) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to `multisets` in a standard way by defining `set_union` to contain the maximum number of occurrences of every element, `set_intersection` to contain the minimum, and so on.

27.8.7.2 includes

[includes]

```

template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                      InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                      InputIterator2 first2, InputIterator2 last2,
                      Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool includes(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                               projected<I2, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {});
```

```

        Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                 projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {},
                               Proj1 proj1 = {}, Proj2 proj2 = {});

```

- 1 Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.
- 2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and `proj1` or `proj2`, respectively.
- 3 *Returns:* `true` if and only if `[first2, last2)` is a subsequence of `[first1, last1)`.
[Note 1: A sequence S is a subsequence of another sequence T if S can be obtained from T by removing some, all, or none of T 's elements and keeping the remaining elements in the same order. —end note]
- 4 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.

27.8.7.3 set_union

[[set.union](#)]

```

template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
set_union(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
set_union(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<I1, I2, O>
ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
                  Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
                  Proj1 proj1 = {}, Proj2 proj2 = {});

```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

- 2 *Preconditions:* The ranges `[first1, last1)` and `[first2, last2)` are sorted with respect to `comp` and
 3 `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.
 4 *Effects:* Constructs a sorted union of the elements from the two ranges; that is, the set of elements that
 5 are present in one or both of the ranges.
 6 *Returns:* Let `result_last` be the end of the constructed range. Returns
 (4.1) — `result_last` for the overloads in namespace `std`.
 (4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.
 5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applica-
 6 tions of each projection.
 6 *Remarks:* Stable (16.4.6.8). If `[first1, last1)` contains m elements that are equivalent to each other
 and `[first2, last2)` contains n elements that are equivalent to them, then all m elements from the
 first range are copied to the output range, in order, and then the final $\max(n - m, 0)$ elements from
 the second range are copied to the output range, in order.

27.8.7.4 `set_intersection`

[`set.intersection`]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
                InputIterator2 first2, InputIterator2 last2,
                OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2,
                ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
                InputIterator2 first2, InputIterator2 last2,
                OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2,
                ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<I1, I2, O>
ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::set_intersection(R1&& r1, R2&& r2, O result,
                        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by
 those names.

- 2 *Preconditions:* The ranges $[first1, last1]$ and $[first2, last2]$ are sorted with respect to `comp` and
 3 `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.
 4 *Effects:* Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements
 5 that are present in both of the ranges.
 6 *Returns:* Let `result_last` be the end of the constructed range. Returns
 (4.1) — `result_last` for the overloads in namespace `std`.
 (4.2) — $\{last1, last2, result_last\}$ for the overloads in namespace `ranges`.
 5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applica-
 6 tions of each projection.
 6 *Remarks:* Stable (16.4.6.8). If $[first1, last1]$ contains m elements that are equivalent to each other
 and $[first2, last2]$ contains n elements that are equivalent to them, the first $\min(m, n)$ elements are
 copied from the first range to the output range, in order.

27.8.7.5 `set_difference`[`set_difference`]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
set_difference(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
set_difference(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<I1, O>
ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                      Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>
ranges::set_difference(R1&& r1, R2&& r2, O result,
                      Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by
 those names.
 2 *Preconditions:* The ranges $[first1, last1]$ and $[first2, last2]$ are sorted with respect to `comp` and
 and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

- 3 *Effects:* Copies the elements of the range $[first1, last1)$ which are not present in the range $[first2, last2)$ to the range beginning at **result**. The elements in the constructed range are sorted.
- 4 *Returns:* Let **result_last** be the end of the constructed range. Returns
- (4.1) — **result_last** for the overloads in namespace **std**.
- (4.2) — $\{last1, result_last\}$ for the overloads in namespace **ranges**.
- 5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.
- 6 *Remarks:* If $[first1, last1)$ contains m elements that are equivalent to each other and $[first2, last2)$ contains n elements that are equivalent to them, the last $\max(m - n, 0)$ elements from $[first1, last1)$ are copied to the output range, in order.

27.8.7.6 set_symmetric_difference

[set.symmetric.difference]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2,
                        OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
                        ForwardIterator1 first1, ForwardIterator1 last1,
                        ForwardIterator2 first2, ForwardIterator2 last2,
                        ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2, InputIterator2 last2,
                        OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
                        ForwardIterator1 first1, ForwardIterator1 last1,
                        ForwardIterator2 first2, ForwardIterator2 last2,
                        ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<I1, I2, O>
ranges::set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                                Comp comp = {}, Proj1 proj1 = {},
                                Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<borrowed_iterator_t<R1>,
                                                borrowed_iterator_t<R2>, O>
ranges::set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
                                Proj1 proj1 = {}, Proj2 proj2 = {});
```

- 1 Let **comp** be **less{}**, and **proj1** and **proj2** be **identity{}** for the overloads with no parameters by those names.
- 2 *Preconditions:* The ranges $[first1, last1)$ and $[first2, last2)$ are sorted with respect to **comp** and **proj1** or **proj2**, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects:* Copies the elements of the range $[first1, last1)$ that are not present in the range $[first2, last2)$, and the elements of the range $[first2, last2)$ that are not present in the range $[first1, last1)$ to the range beginning at `result`. The elements in the constructed range are sorted.

4 *Returns:* Let `result_last` be the end of the constructed range. Returns

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5 *Complexity:* At most $2 * ((last1 - first1) + (last2 - first2)) - 1$ comparisons and applications of each projection.

6 *Remarks:* Stable (16.4.6.8). If $[first1, last1)$ contains m elements that are equivalent to each other and $[first2, last2)$ contains n elements that are equivalent to them, then $|m - n|$ of those elements shall be copied to the output range: the last $m - n$ of these elements from $[first1, last1)$ if $m > n$, and the last $n - m$ of these elements from $[first2, last2)$ if $m < n$. In either case, the elements are copied in order.

27.8.8 Heap operations

[alg.heap.operations]

27.8.8.1 General

[alg.heap.operations.general]

1 A random access range $[a, b)$ is a *heap with respect to comp and proj* for a comparator and projection `comp` and `proj` if its elements are organized such that:

(1.1) — With $N = b - a$, for all i , $0 < i < N$, `bool(invoker(comp, invoke(proj, a[$\lfloor \frac{i-1}{2} \rfloor$]), invoke(proj, a[i])))` is `false`.

(1.2) — $*a$ may be removed by `pop_heap`, or a new element added by `push_heap`, in $\mathcal{O}(\log N)$ time.

2 These properties make heaps useful as priority queues.

3 `make_heap` converts a range into a heap and `sort_heap` turns a heap into a sorted sequence.

27.8.8.2 push_heap

[push.heap]

```
template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions:* The range $[first, last - 1)$ is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of $*first$ meets the *Cpp17MoveConstructible* requirements (Table 31) and the *Cpp17MoveAssignable* requirements (Table 33).

3 *Effects:* Places the value in the location $last - 1$ into the resulting heap $[first, last)$.

4 *Returns:* `last` for the overloads in namespace `ranges`.

5 *Complexity:* At most $\log(last - first)$ comparisons and twice as many projections.

27.8.8.3 pop_heap

[pop.heap]

```
template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```

template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* The range `[first, last)` is a valid non-empty heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the `Cpp17ValueSwappable` requirements ([16.4.4.3](#)) and the type of `*first` meets the `Cpp17MoveConstructible` ([Table 31](#)) and `Cpp17MoveAssignable` ([Table 33](#)) requirements.
- 3 *Effects:* Swaps the value in the location `first` with the value in the location `last - 1` and makes `[first, last - 1)` into a heap with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most $2 \log(last - first)$ comparisons and twice as many projections.

27.8.8.4 make_heap

[make.heap]

```

template<class RandomAccessIterator>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* For the overloads in namespace `std`, `RandomAccessIterator` meets the `Cpp17ValueSwappable` requirements ([16.4.4.3](#)) and the type of `*first` meets the `Cpp17MoveConstructible` ([Table 31](#)) and `Cpp17MoveAssignable` ([Table 33](#)) requirements.
- 3 *Effects:* Constructs a heap with respect to `comp` and `proj` out of the range `[first, last)`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most $3(last - first)$ comparisons and twice as many projections.

27.8.8.5 sort_heap

[sort.heap]

```

template<class RandomAccessIterator>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

```

```

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});

```

- 1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.
- 2 *Preconditions:* The range `[first, last)` is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements ([16.4.4.3](#)) and the type of `*first` meets the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17MoveAssignable* ([Table 33](#)) requirements.
- 3 *Effects:* Sorts elements in the heap `[first, last)` with respect to `comp` and `proj`.
- 4 *Returns:* `last` for the overloads in namespace `ranges`.
- 5 *Complexity:* At most $2N \log N$ comparisons, where $N = \text{last} - \text{first}$, and twice as many projections.

27.8.8.6 `is_heap`

[`is.heap`]

```

template<class RandomAccessIterator>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
1   Effects: Equivalent to: return is_heap_until(first, last) == last;

template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);
2   Effects: Equivalent to:
        return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                      Compare comp);
3   Effects: Equivalent to: return is_heap_until(first, last, comp) == last;

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);
4   Effects: Equivalent to:
        return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});

5   Effects: Equivalent to: return ranges::is_heap_until(first, last, comp, proj) == last;

template<class RandomAccessIterator>
constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last);

```

```

template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
            Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
is_heap_until(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});

6   Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
7   Returns: The last iterator i in [first, last] for which the range [first, i) is a heap with respect to
              comp and proj.
8   Complexity: Linear.

```

27.8.9 Minimum and maximum

[alg.min.max]

```

template<class T>
constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});

1   Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 29).
2   Returns: The smaller value. Returns the first argument when the arguments are equivalent.
3   Complexity: Exactly one comparison and two applications of the projection, if any.
4   Remarks: An invocation may explicitly specify an argument for the template parameter T of the
              overloads in namespace std.

template<class T>
constexpr T min(initializer_list<T> r);
template<class T, class Compare>
constexpr T min(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
constexpr range_value_t<R>
ranges::min(R&& r, Comp comp = {}, Proj proj = {});

5   Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
              CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements
              (Table 29).
6   Returns: The smallest value in the input range. Returns a copy of the leftmost element when several
              elements are equivalent to the smallest.
7   Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the
              projection, if any.

```

8 *Remarks:* An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

```
template<class T>
constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

9 *Preconditions:* For the first form, T meets the Cpp17LessThanComparable requirements ([Table 29](#)).

10 *Returns:* The larger value. Returns the first argument when the arguments are equivalent.

11 *Complexity:* Exactly one comparison and two applications of the projection, if any.

12 *Remarks:* An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

```
template<class T>
constexpr T max(initializer_list<T> r);
template<class T, class Compare>
constexpr T max(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
constexpr range_value_t<R>
ranges::max(R&& r, Comp comp = {}, Proj proj = {});
```

13 *Preconditions:* ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements ([Table 29](#)).

14 *Returns:* The largest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the largest.

15 *Complexity:* Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the projection, if any.

16 *Remarks:* An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

```
template<class T>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<const T&>
ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

17 *Preconditions:* For the first form, T meets the Cpp17LessThanComparable requirements ([Table 29](#)).

18 *Returns:* {b, a} if b is smaller than a, and {a, b} otherwise.

19 *Complexity:* Exactly one comparison and two applications of the projection, if any.

20 *Remarks:* An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

```
template<class T>
constexpr pair<T, T> minmax(initializer_list<T> t);
```

```

template<class T, class Compare>
constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<T>
ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
constexpr ranges::minmax_result<range_value_t<R>>
ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});

21  Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
CopyConstructible requirements. For the first form, type T meets the Cpp17LessThanComparable
requirements (Table 29).

22  Returns: Let X be the return type. Returns X{x, y}, where x is a copy of the leftmost element with
the smallest value and y a copy of the rightmost element with the largest value in the input range.

23  Complexity: At most  $(3/2)\text{ranges}::\text{distance}(r)$  applications of the corresponding predicate and twice
as many applications of the projection, if any.

24  Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
                           ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>

constexpr ranges::minmax_element_result<borrowed_iterator_t<R>>
ranges::minmax_element(R&& r, Comp comp = {}, Proj proj = {});

31   Returns: {first, first} if [first, last) is empty, otherwise {m, M}, where m is the first iterator in
[first, last) such that no iterator in the range refers to a smaller element, and where M is the last
iterator217 in [first, last) such that no iterator in the range refers to a larger element.

32   Complexity: Let N be last - first. At most max(\lfloor \frac{3}{2}(N - 1) \rfloor, 0) comparisons and twice as many
applications of the projection, if any.

```

27.8.10 Bounded value

[alg.clamp]

```

template<class T>
constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);

```

²¹⁷) This behavior intentionally differs from `max_element`.

```

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T&
ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});

```

1 Let `comp` be `less{}` for the overloads with no parameter `comp`, and let `proj` be `identity{}` for the overloads with no parameter `proj`.

2 *Preconditions:* `bool(invoker(comp, invoke(proj, hi), invoke(proj, lo)))` is false. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements ([Table 29](#)).

3 *Returns:* `lo` if `bool(invoker(comp, invoke(proj, v), invoke(proj, lo)))` is true, `hi` if `bool(invoker(comp, invoke(proj, hi), invoke(proj, v)))` is true, otherwise `v`.

4 [Note 1: If NaN is avoided, `T` can be a floating-point type. — end note]

5 *Complexity:* At most two comparisons and three applications of the projection.

27.8.11 Lexicographical comparison

[[alg.lex.comparison](#)]

```

template<class InputIterator1, class InputIterator2>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool
lexicographical_compare(ExecutionPolicy&& exec,
                       ForwardIterator1 first1, ForwardIterator1 last1,
                       ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                       InputIterator2 first2, InputIterator2 last2,
                       Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Compare>
bool
lexicographical_compare(ExecutionPolicy&& exec,
                       ForwardIterator1 first1, ForwardIterator1 last1,
                       ForwardIterator2 first2, ForwardIterator2 last2,
                       Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
        class Proj1 = identity, class Proj2 = identity,
        indirect_strict_weak_order<projected<I1, Proj1>,
                               projected<I2, Proj2>> Comp = ranges::less>
constexpr bool
ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
                                Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
        class Proj2 = identity,
        indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                               projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool
ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
                                Proj1 proj1 = {}, Proj2 proj2 = {});

```

- 1 *Returns:* true if and only if the sequence of elements defined by the range `[first1, last1)` is lexicographically less than the sequence of elements defined by the range `[first2, last2)`.
- 2 *Complexity:* At most $2 \min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the corresponding comparison and each projection, if any.
- 3 *Remarks:* If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence.

Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

4 [Example 1: `ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2)` can be implemented as:

```
for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
    if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;
— end example]
```

5 [Note 1: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — end note]

27.8.12 Three-way comparison algorithms

[`alg.three.way`]

```
template<class InputIterator1, class InputIterator2, class Cmp>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                    InputIterator2 b2, InputIterator2 e2,
                                    Cmp comp)
    -> decltype(comp(*b1, *b2));
1 Let  $N$  be  $\min(e1 - b1, e2 - b2)$ . Let  $E(n)$  be  $\text{comp}(*(\mathbf{b1} + n), *(\mathbf{b2} + n))$ .
2 Mandates: decltype(comp(*b1, *b2)) is a comparison category type.
3 Returns:  $E(i)$ , where  $i$  is the smallest integer in  $[0, N]$  such that  $E(i) \neq 0$  is true, or  $(e1 - b1) \leftrightarrow (e2 - b2)$  if no such integer exists.
4 Complexity: At most  $N$  applications of comp.
```

```
template<class InputIterator1, class InputIterator2>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                    InputIterator2 b2, InputIterator2 e2);
5 Effects: Equivalent to:
    return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

27.8.13 Permutation generators

[`alg.permutation.generators`]

```
template<class BidirectionalIterator>
constexpr bool next_permutation(BidirectionalIterator first,
                                BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool next_permutation(BidirectionalIterator first,
                                BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::next_permutation_result<I>
ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
2 Preconditions: For the overloads in namespace std, BidirectionalIterator meets the Cpp17Value-Swappable requirements (16.4.4.3).
3 Effects: Takes a sequence defined by the range [first, last) and transforms it into the next permutation.
The next permutation is found by assuming that the set of all permutations is lexicographically sorted
```

with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

4 >Returns: Let `B` be `true` if a next permutation was found and otherwise `false`. Returns:

(4.1) — `B` for the overloads in namespace `std`.

(4.2) — `{ last, B }` for the overloads in namespace `ranges`.

5 `Complexity`: At most `(last - first) / 2` swaps.

```
template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
                                BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
                                BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::prev_permutation_result<I>
ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});

template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

7 `Preconditions`: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17Value-Swappable* requirements ([16.4.4.3](#)).

8 `Effects`: Takes a sequence defined by the range `[first, last)` and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

9 >Returns: Let `B` be `true` if a previous permutation was found and otherwise `false`. Returns:

(9.1) — `B` for the overloads in namespace `std`.

(9.2) — `{ last, B }` for the overloads in namespace `ranges`.

10 `Complexity`: At most `(last - first) / 2` swaps.

}

```

27.10 Generalized numeric operations

[numeric.ops]

27.10.1 General

[numeric.ops.general]

- ¹ [Note 1: The use of closed ranges as well as semi-open ranges to specify requirements throughout 27.10 is intentional.
— end note]

27.10.2 Definitions

[numerics.defns]

- ¹ Define *GENERALIZED_NONCOMMUTATIVE_SUM*(*op*, *a*₁, ..., *a*_N) as follows:

- (1.1) — *a*₁ when *N* is 1, otherwise
 (1.2) — *op*(*GENERALIZED_NONCOMMUTATIVE_SUM*(*op*, *a*₁, ..., *a*_K),
 GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*_M, ..., *a*_N)) for any *K* where $1 < K + 1 = M \leq N$.

- ² Define *GENERALIZED_SUM*(*op*, *a*₁, ..., *a*_N) as *GENERALIZED_NONCOMMUTATIVE_SUM*(*op*, *b*₁, ..., *b*_N), where *b*₁, ..., *b*_N may be any permutation of *a*₁, ..., *a*_N.

27.10.3 Accumulate

[accumulate]

```

template<class InputIterator, class T>
constexpr T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
constexpr T accumulate(InputIterator first, InputIterator last, T init,
                     BinaryOperation binary_op);

```

- ¹ *Preconditions*: *T* meets the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. In the range [*first*, *last*], *binary_op* neither modifies elements nor invalidates iterators or subranges.²¹⁸

- ² *Effects*: Computes its result by initializing the accumulator *acc* with the initial value *init* and then modifies it with *acc* = *std::move*(*acc*) + **i* or *acc* = *binary_op*(*std::move*(*acc*), **i*) for every iterator *i* in the range [*first*, *last*] in order.²¹⁹

27.10.4 Reduce

[reduce]

```

template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::value_type
    reduce(InputIterator first, InputIterator last);

1 Effects: Equivalent to:
    return reduce(first, last,
                  typename iterator_traits<InputIterator>::value_type{});

```

²¹⁸) The use of fully closed ranges is intentional.

²¹⁹) *accumulate* is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

```

template<class ExecutionPolicy, class ForwardIterator>
typename iterator_traits<ForwardIterator>::value_type
reduce(ExecutionPolicy&& exec,
       ForwardIterator first, ForwardIterator last);

2   Effects: Equivalent to:
        return reduce(std::forward<ExecutionPolicy>(exec), first, last,
                      typename iterator_traits<ForwardIterator>::value_type{});

template<class InputIterator, class T>
constexpr T reduce(InputIterator first, InputIterator last, T init);

3   Effects: Equivalent to:
        return reduce(first, last, init, plus<>());

template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, T init);

4   Effects: Equivalent to:
        return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());

```

```

template<class InputIterator, class T, class BinaryOperation>
constexpr T reduce(InputIterator first, InputIterator last, T init,
                  BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, T init,
         BinaryOperation binary_op);

```

5 Mandates: All of

- (5.1) — `binary_op(init, *first)`,
- (5.2) — `binary_op(*first, init)`,
- (5.3) — `binary_op(init, init)`, and
- (5.4) — `binary_op(*first, *first)`

are convertible to `T`.

6 Preconditions:

- (6.1) — `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
- (6.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the range `[first, last]`.

7 Returns: `GENERALIZED_SUM(binary_op, init, *i, ...)` for every `i` in `[first, last]`.

8 Complexity: $\mathcal{O}(\text{last} - \text{first})$ applications of `binary_op`.

9 [Note 1: The difference between `reduce` and `accumulate` is that `reduce` applies `binary_op` in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative `binary_op` such as floating-point addition. — end note]

27.10.5 Inner product

[\[inner.product\]](#)

```

template<class InputIterator1, class InputIterator2, class T>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, T init);
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                           InputIterator2 first2, T init,
                           BinaryOperation1 binary_op1,
                           BinaryOperation2 binary_op2);

```

1 Preconditions: `T` meets the *Cpp17CopyConstructible* ([Table 32](#)) and *Cpp17CopyAssignable* ([Table 34](#)) requirements. In the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]` `binary_op1`

and `binary_op2` neither modifies elements nor invalidates iterators or subranges.²²⁰

Effects: Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifying it with `acc = std::move(acc) + (*i1) * (*i2)` or `acc = binary_op1(std::move(acc), binary_op2(*i1, *i2))` for every iterator `i1` in the range `[first1, last1]` and iterator `i2` in the range `[first2, first2 + (last1 - first1)]` in order.

27.10.6 Transform reduce

[`transform.reduce`]

```
template<class InputIterator1, class InputIterator2, class T>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2,
                            T init);
```

Effects: Equivalent to:

```
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2,
                  T init);
```

Effects: Equivalent to:

```
return transform_reduce(std::forward<ExecutionPolicy>(exec),
                      first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2,
                            T init,
                            BinaryOperation1 binary_op1,
                            BinaryOperation2 binary_op2);
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2,
                  T init,
                  BinaryOperation1 binary_op1,
                  BinaryOperation2 binary_op2);
```

Mandates: All of

- (3.1) — `binary_op1(init, init)`,
- (3.2) — `binary_op1(init, binary_op2(*first1, *first2))`,
- (3.3) — `binary_op1(binary_op2(*first1, *first2), init)`, and
- (3.4) — `binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))`

are convertible to `T`.

Preconditions:

- (4.1) — `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
- (4.2) — Neither `binary_op1` nor `binary_op2` invalidates subranges, nor modifies elements in the ranges `[first1, last1]` and `[first2, first2 + (last1 - first1)]`.

Returns:

`GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)`
for every iterator `i` in `[first1, last1]`.

²²⁰) The use of fully closed ranges is intentional.

6 *Complexity:* $\mathcal{O}(\text{last1} - \text{first1})$ applications each of `binary_op1` and `binary_op2`.

```
template<class InputIterator, class T,
         class BinaryOperation, class UnaryOperation>
constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
                           BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator, class T,
         class BinaryOperation, class UnaryOperation>
T transform_reduce(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  T init, BinaryOperation binary_op, UnaryOperation unary_op);
```

7 *Mandates:* All of

- (7.1) — `binary_op(init, init)`,
- (7.2) — `binary_op(init, unary_op(*first))`,
- (7.3) — `binary_op(unary_op(*first), init)`, and
- (7.4) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

8 *Preconditions:*

- (8.1) — `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
- (8.2) — Neither `unary_op` nor `binary_op` invalidates subranges, nor modifies elements in the range `[first, last]`.

9 *Returns:*

`GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)`
for every iterator `i` in `[first, last]`.

10 *Complexity:* $\mathcal{O}(\text{last} - \text{first})$ applications each of `unary_op` and `binary_op`.

11 [Note 1: `transform_reduce` does not apply `unary_op` to `init`. — *end note*]

27.10.7 Partial sum

[[partial.sum](#)]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last,
            OutputIterator result);
template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last,
            OutputIterator result, BinaryOperation binary_op);
```

1 *Mandates:* `InputIterator`'s value type is constructible from `*first`. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` is implicitly convertible to `InputIterator`'s value type. `acc` is writable ([25.3.1](#)) to `result`.

2 *Preconditions:* In the ranges `[first, last]` and `[result, result + (last - first)]` `binary_op` neither modifies elements nor invalidates iterators or subranges.²²¹

3 *Effects:* For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, `acc` is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.

4 *Returns:* `result + (last - first)`.

5 *Complexity:* Exactly $(\text{last} - \text{first}) - 1$ applications of the binary operation.

6 *Remarks:* `result` may be equal to `first`.

²²¹ The use of fully closed ranges is intentional.

27.10.8 Exclusive scan

[exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last,
              OutputIterator result, T init);

1   Effects: Equivalent to:
        return exclusive_scan(first, last, result, init, plus<>());

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, T init);

2   Effects: Equivalent to:
        return exclusive_scan(std::forward<ExecutionPolicy>(exec),
                               first, last, result, init, plus<>());

template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last,
              OutputIterator result, T init, BinaryOperation binary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
               ForwardIterator1 first, ForwardIterator1 last,
               ForwardIterator2 result, T init, BinaryOperation binary_op);
```

3 Mandates: All of

- (3.1) — `binary_op(init, init)`,
- (3.2) — `binary_op(init, *first)`, and
- (3.3) — `binary_op(*first, *first)`

are convertible to `T`.

4 Preconditions:

- (4.1) — `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements.
- (4.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

5 Effects: For each integer `K` in $[0, \text{last} - \text{first}]$ assigns through `result + K` the value of:

GENERALIZED_NONCOMMUTATIVE_SUM
`binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1)`

6 Returns: The end of the resulting range beginning at `result`.7 Complexity: $\mathcal{O}(\text{last} - \text{first})$ applications of `binary_op`.8 Remarks: `result` may be equal to `first`.9 [Note 1: The difference between `exclusive_scan` and `inclusive_scan` is that `exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `exclusive_scan` can be nondeterministic. — end note]

27.10.9 Inclusive scan

[inclusive.scan]

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result);
```

1 Effects: Equivalent to:

```
return inclusive_scan(first, last, result, plus<>());
```

```

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last,
                    ForwardIterator2 result);

2   Effects: Equivalent to:
        return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last,
                    ForwardIterator2 result, BinaryOperation binary_op);

template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                  OutputIterator result, BinaryOperation binary_op, T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last,
                    ForwardIterator2 result, BinaryOperation binary_op, T init);

```

3 Let U be the value type of `decltype(first)`.

4 Mandates: If `init` is provided, all of

- (4.1) — `binary_op(init, init)`,
- (4.2) — `binary_op(init, *first)`, and
- (4.3) — `binary_op(*first, *first)`

are convertible to `T`; otherwise, `binary_op(*first, *first)` is convertible to `U`.

5 Preconditions:

- (5.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.
- (5.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges $[first, last]$ or $[result, result + (last - first)]$.

6 Effects: For each integer `K` in $[0, last - first]$ assigns through `result + K` the value of

- (6.1) — `GENERALIZED_NONCOMMUTATIVE_SUM`

$$\text{binary_op, init, } *(\text{first} + 0), *(\text{first} + 1), \dots, *(\text{first} + K)$$
 if `init` is provided, or
- (6.2) — `GENERALIZED_NONCOMMUTATIVE_SUM`

$$\text{binary_op, } *(\text{first} + 0), *(\text{first} + 1), \dots, *(\text{first} + K)$$
 otherwise.

7 Returns: The end of the resulting range beginning at `result`.

8 Complexity: $\mathcal{O}(last - first)$ applications of `binary_op`.

9 Remarks: `result` may be equal to `first`.

10 [Note 1: The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` can be nondeterministic. — end note]

27.10.10 Transform exclusive scan

[transform.exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T,
         class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
    transform_exclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result, T init,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation, class UnaryOperation>
ForwardIterator2
    transform_exclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result, T init,
                             BinaryOperation binary_op, UnaryOperation unary_op);
```

1 *Mandates:* All of

- (1.1) — `binary_op(init, init)`,
- (1.2) — `binary_op(init, unary_op(*first))`, and
- (1.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

2 *Preconditions:*

- (2.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.
- (2.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

3 *Effects:* For each integer `K` in $[0, \text{last} - \text{first}]$ assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K - 1)))
```

4 *Returns:* The end of the resulting range beginning at `result`.

5 *Complexity:* $\mathcal{O}(\text{last} - \text{first})$ applications each of `unary_op` and `binary_op`.

6 *Remarks:* `result` may be equal to `first`.

7 *[Note 1:* The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` can be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`. —end note]

27.10.11 Transform inclusive scan

[transform.inclusive.scan]

```
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation>
ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation, class T>
constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result,
```

```

        BinaryOperation binary_op, UnaryOperation unary_op,
        T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation, class T>
ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result,
                           BinaryOperation binary_op, UnaryOperation unary_op,
                           T init);

```

1 Let U be the value type of `decltype(first)`.

2 *Mandates:* If `init` is provided, all of

- (2.1) — `binary_op(init, init)`,
- (2.2) — `binary_op(init, unary_op(*first))`, and
- (2.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`; otherwise, `binary_op(unary_op(*first), unary_op(*first))` is convertible to `U`.

3 *Preconditions:*

- (3.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* ([Table 31](#)) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.
- (3.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

4 *Effects:* For each integer K in $[0, \text{last} - \text{first}]$ assigns through `result + K` the value of

- (4.1) — *GENERALIZED_NONCOMMUTATIVE_SUM*
`binary_op, init,`
`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))`
if `init` is provided, or
- (4.2) — *GENERALIZED_NONCOMMUTATIVE_SUM*
`binary_op,`
`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))`
otherwise.

5 *Returns:* The end of the resulting range beginning at `result`.

6 *Complexity:* $\mathcal{O}(\text{last} - \text{first})$ applications each of `unary_op` and `binary_op`.

7 *Remarks:* `result` may be equal to `first`.

8 [Note 1: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_inclusive_scan` can be nondeterministic. `transform_inclusive_scan` does not apply `unary_op` to `init`. —end note]

27.10.12 Adjacent difference

[adjacent.difference]

```

template<class InputIterator, class OutputIterator>
constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                       OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                       ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                       OutputIterator result, BinaryOperation binary_op);

```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
                    ForwardIterator1 first, ForwardIterator1 last,
                    ForwardIterator2 result, BinaryOperation binary_op);
```

1 Let T be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`,
let `binary_op` be an lvalue that denotes an object of type `minus<T>`.

2 *Mandates:*

- (2.1) — For the overloads with no `ExecutionPolicy`, T is constructible from `*first`. `acc` (defined below)
is writable ([25.3.1](#)) to the `result` output iterator. The result of the expression `binary_op(val,`
`std::move(acc))` is writable to `result`.
- (2.2) — For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first,`
`*first)` and `*first` are writable to `result`.

3 *Preconditions:*

- (3.1) — For the overloads with no `ExecutionPolicy`, T meets the *Cpp17MoveAssignable* ([Table 33](#))
requirements.
- (3.2) — For all overloads, in the ranges `[first, last]` and `[result, result + (last - first)]`, `binary_-`
`op` neither modifies elements nor invalidates iterators or subranges.²²²

4 *Effects:* For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an
accumulator `acc` of type T, initializes it with `*first`, and assigns the result to `*result`. For every
iterator i in `[first + 1, last)` in order, creates an object `val` whose type is T, initializes it with `*i`,
computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and
`move` assigns from `val` to `acc`.

5 For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`.
Then, for every d in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d),`
`*(first + (d - 1)))`.

6 *Returns:* `result + (last - first)`.

7 *Complexity:* Exactly `(last - first) - 1` applications of the binary operation.

8 *Remarks:* For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads
with an `ExecutionPolicy`, the ranges `[first, last)` and `[result, result + (last - first))` shall
not overlap.

27.10.13 Iota

[[numeric.iota](#)]

```
template<class ForwardIterator, class T>
constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

1 *Mandates:* T is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has
type T, is well-formed.

2 *Effects:* For each element referred to by the iterator i in the range `[first, last)`, assigns `*i = value`
and increments `value` as if `++value`.

3 *Complexity:* Exactly `last - first` increments and assignments.

```
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
requires indirectly_writable<O, const T&>
constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);
template<weakly_incrementable T, output_range<const T&> R>
constexpr ranges::iota_result<borrowed_iterator_t<R>, T> ranges::iota(R&& r, T value);
```

4 *Effects:* Equivalent to:

```
while (first != last) {
    *first = as_const(value);
    ++first;
```

²²²) The use of fully closed ranges is intentional.

```

    ++value;
}
return {std::move(first), std::move(value)};

```

27.10.14 Greatest common divisor

[**numeric.ops.gcd**]

```
template<class M, class N>
constexpr common_type_t<M, N> gcd(M m, N n);
```

- 1 *Mandates:* M and N both are integer types other than cv bool.
- 2 *Preconditions:* |m| and |n| are representable as a value of common_type_t<M, N>.
[Note 1: These requirements ensure, for example, that gcd(m, m) = |m| is representable as a value of type M. — end note]
- 3 *Returns:* Zero when m and n are both zero. Otherwise, returns the greatest common divisor of |m| and |n|.
- 4 *Throws:* Nothing.

27.10.15 Least common multiple

[**numeric.ops.lcm**]

```
template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);
```

- 1 *Mandates:* M and N both are integer types other than cv bool.
- 2 *Preconditions:* |m| and |n| are representable as a value of common_type_t<M, N>. The least common multiple of |m| and |n| is representable as a value of type common_type_t<M, N>.
- 3 *Returns:* Zero when either m or n is zero. Otherwise, returns the least common multiple of |m| and |n|.
- 4 *Throws:* Nothing.

27.10.16 Midpoint

[**numeric.ops.midpoint**]

```
template<class T>
constexpr T midpoint(T a, T b) noexcept;
```

- 1 *Constraints:* T is an arithmetic type other than bool.
- 2 *Returns:* Half the sum of a and b. If T is an integer type and the sum is odd, the result is rounded towards a.
- 3 *Remarks:* No overflow occurs. If T is a floating-point type, at most one inexact operation occurs.

```
template<class T>
constexpr T* midpoint(T* a, T* b);
```

- 4 *Constraints:* T is an object type.
- 5 *Mandates:* T is a complete type.
- 6 *Preconditions:* a and b point to, respectively, elements i and j of the same array object x.
[Note 1: As specified in 6.8.4, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of n elements is considered to be equivalent to a pointer to a hypothetical array element n for this purpose. — end note]
- 7 *Returns:* A pointer to array element $i + \frac{j-i}{2}$ of x, where the result of the division is truncated towards zero.

27.11 Specialized <memory> algorithms

[**specialized.algorithms**]

27.11.1 General

[**specialized.algorithms.general**]

- 1 The contents specified in 27.11 are declared in the header <memory> (20.2.2).
- 2 Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement new-expression (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.
- 3 Some algorithms specified in 27.11 make use of the exposition-only function template *voidify*:

```
template<class T>
constexpr void* voidify(T& obj) noexcept {
    return addressof(obj);
}
```

27.11.2 Special memory concepts

[special.mem.concepts]

- 1 Some algorithms in this subclause are constrained with the following exposition-only concepts:

```
template<class I>
concept nothrow_input_iterator = // exposition only
    input_iterator<I> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

- 2 A type I models *nothrow-input-iterator* only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.

- 3 [Note 1: This concept allows some *input_iterator* (25.3.4.9) operations to throw exceptions. —end note]

```
template<class S, class I>
concept nothrow_sentinel_for = sentinel_for<S, I>; // exposition only
```

- 4 Types S and I model *nothrow-sentinel-for* only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type I and S.

- 5 [Note 2: This concept allows some *sentinel_for* (25.3.4.7) operations to throw exceptions. —end note]

```
template<class R>
concept nothrow_input_range = // exposition only
    range<R> &&
    nothrow_input_iterator<iterator_t<R>> &&
    nothrow_sentinel_for<sentinel_t<R>, iterator_t<R>>;
```

- 6 A type R models *nothrow-input-range* only if no exceptions are thrown from calls to `ranges::begin` and `ranges::end` on an object of type R.

```
template<class I>
concept nothrow_forward_iterator = // exposition only
    nothrow_input_iterator<I> &&
    forward_iterator<I> &&
    nothrow_sentinel_for<I, I>;
```

- 7 [Note 3: This concept allows some *forward_iterator* (25.3.4.11) operations to throw exceptions. —end note]

```
template<class R>
concept nothrow_forward_range = // exposition only
    nothrow_input_range<R> &&
    nothrow_forward_iterator<iterator_t<R>>;
```

27.11.3 uninitialized_default_construct

[uninitialized.construct.default]

```
template<class NoThrowForwardIterator>
void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

- 1 Effects: Equivalent to:

```
for (; first != last; ++first)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type;
```

```
namespace ranges {
    template<nothrow_forward_iterator I, nothrow_sentinel_for<I> S>
        requires default_initializable<iter_value_t<I>>
            I uninitialized_default_construct(I first, S last);
```

```

template<nothrow-forward-range R>
    requires default_initializable<range_value_t<R>>
    borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}

2   Effects: Equivalent to:
    for (; first != last; ++first)
        ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
    return first;

template<class NoThrowForwardIterator, class Size>
    NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);

3   Effects: Equivalent to:
    for (; n > 0; (void)++first, --n)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type;
    return first;

namespace ranges {
    template<nothrow-forward-iterator I>
        requires default_initializable<iter_value_t<I>>
        I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}

4   Effects: Equivalent to:
    return uninitialized_default_construct(counted_iterator(first, n),
                                            default_sentinel).base();

```

27.11.4 uninitialized_value_construct [uninitialized.construct.value]

```

template<class NoThrowForwardIterator>
    void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);

```

1 Effects: Equivalent to:

```

    for (; first != last; ++first)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type();

```

```

namespace ranges {
    template<nothrow-forward-iterator I, noexcept-for<I> S>
        requires default_initializable<iter_value_t<I>>
        I uninitialized_value_construct(I first, S last);
    template<nothrow-forward-range R>
        requires default_initializable<range_value_t<R>>
        borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}

```

2 Effects: Equivalent to:

```

    for (; first != last; ++first)
        ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
    return first;

```

```

template<class NoThrowForwardIterator, class Size>
    NoThrowForwardIterator uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);

```

3 Effects: Equivalent to:

```

    for (; n > 0; (void)++first, --n)
        ::new (voidify(*first))
            typename iterator_traits<NoThrowForwardIterator>::value_type();
    return first;

```

```

namespace ranges {
    template<nothrow-forward-iterator I>
        requires default_initializable<iter_value_t<I>>
        I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}

```

}

4 *Effects:* Equivalent to:

27.11.5 uninitialized_copy

[uninitialized.copy]

Preconditions: `result + [0, (last - first)]` does not overlap with `[first, last]`.

2 *Effects:* Equivalent to:

```
for ( ; first != last; ++result, (void) ++first)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

3 Returns: result.

```
namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
              nothrow_forward_iterator O, nothrow_sentinel_for<O> S2>
        requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_result<I, O>
        uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
    template<input_range IR, nothrow_forward_range OR>
        requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
    uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
        uninitialized_copy(IR&& in_range, OR&& out_range);
}
```

Preconditions: $[ofirst, olast)$ does not overlap with $[ifirst, ilast)$.

5 Effects: Equivalent to:

```
for ( ; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
    :>new (voidify(*ofirst)) remove_reference_t<iter_reference_t<0>>(*ifirst);
return {std::move(ifirst), ofirst};
```

6 *Preconditions:* `result` + [0, n) does not overlap with `first` + [0, n).

7 Effects: Equivalent to:

```
for ( ; n > 0; ++result, (void) ++first, --n)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

8 Returns: result.

```
namespace ranges {
    template<input_iterator I, nothrow_forward_iterator O, nothrow_sentinel_for<O> S>
        requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
        uninitialized_copy_n_result<I, O>
            uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

9 Preconditions: $[ofirst, olast)$ does not overlap with $ifirst + [0, n)$.

10 *Effects:* Equivalent to:

```
auto t = uninitialized_copy(counted_iterator(std::move(ifirst), n),
                           default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

27.11.6 uninitialized_move

[uninitialized.move]

```
template<class InputIterator, class NoThrowForwardIterator>
    NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
                                              NoThrowForwardIterator result);
```

1 *Preconditions:* $\text{result} + [0, (\text{last} - \text{first})]$ does not overlap with $[\text{first}, \text{last}]$.

2 *Effects:* Equivalent to:

```
for (; first != last; (void)++result, ++first)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
    return result;
```

```
namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
              nothrow_forward_iterator O, nothrow_sentinel_for<O> S2>
        requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
        uninitialized_move_result<I, O>
            uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
    template<input_range IR, nothrow_forward_range OR>
        requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
        uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
            uninitialized_move(IR&& in_range, OR&& out_range);
}
```

3 *Preconditions:* $[\text{ofirst}, \text{olast}]$ does not overlap with $[\text{ifirst}, \text{ilast}]$.

4 *Effects:* Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
    ::new (voidify(*ofirst))
        remove_reference_t<iter_reference_t<O>>(ranges::iter_move(ifirst));
    return {std::move(ifirst), ofirst};
```

5 *[Note 1:* If an exception is thrown, some objects in the range $[\text{ifirst}, \text{ilast}]$ are left in a valid, but unspecified state. — *end note*]

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
    pair<InputIterator, NoThrowForwardIterator>
        uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);
```

6 *Preconditions:* $\text{result} + [0, n]$ does not overlap with $\text{first} + [0, n]$.

7 *Effects:* Equivalent to:

```
for (; n > 0; ++result, (void) ++first, --n)
    ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
    return {first, result};
```

```
namespace ranges {
    template<input_iterator I, nothrow_forward_iterator O, nothrow_sentinel_for<O> S>
        requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
        uninitialized_move_n_result<I, O>
            uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

8 *Preconditions:* $[\text{ofirst}, \text{olast}]$ does not overlap with $\text{ifirst} + [0, n]$.

9 *Effects:* Equivalent to:

```
auto t = uninitialized_move(counted_iterator(std::move(ifirst), n),
                           default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

10 *[Note 2:* If an exception is thrown, some objects in the range $\text{ifirst} + [0, n]$ are left in a valid but unspecified state. — *end note*]

27.11.7 uninitialized_fill

[uninitialized.fill]

```

template<class NoThrowForwardIterator, class T>
void uninitialized_fill(NoThrowForwardIterator first, NoThrowForwardIterator last, const T& x);

1   Effects: Equivalent to:
        for (; first != last; ++first)
            ::new (voidify(*first))
                typename iterator_traits<NoThrowForwardIterator>::value_type(x);

namespace ranges {
    template<nothrow-forward-iterator I, noexcept-sentinel-for<I> S, class T>
        requires constructible_from<iter_value_t<I>, const T&>
        I uninitialized_fill(I first, S last, const T& x);
    template<nothrow-forward-range R, class T>
        requires constructible_from<range_value_t<R>, const T&>
        borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);
}

2   Effects: Equivalent to:
        for (; first != last; ++first)
            ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);
        return first;

template<class NoThrowForwardIterator, class Size, class T>
NoThrowForwardIterator uninitialized_n(NoThrowForwardIterator first, Size n, const T& x);

3   Effects: Equivalent to:
        for (; n--; ++first)
            ::new (voidify(*first))
                typename iterator_traits<NoThrowForwardIterator>::value_type(x);
        return first;

namespace ranges {
    template<nothrow-forward-iterator I, class T>
        requires constructible_from<iter_value_t<I>, const T&>
        I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}

4   Effects: Equivalent to:
        return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();

```

27.11.8 construct_at

[specialized.construct]

```

template<class T, class... Args>
constexpr T* construct_at(T* location, Args&&... args);

namespace ranges {
    template<class T, class... Args>
        constexpr T* construct_at(T* location, Args&&... args);
}

```

1 *Constraints:* The expression `::new (declval<void*>()) T(declval<Args>()...)` is well-formed when treated as an unevaluated operand ([7.2.3](#)).

2 *Effects:* Equivalent to:

```
        return ::new (voidify(*location)) T(std::forward<Args>(args)...);
```

27.11.9 destroy

[specialized.destroy]

```

template<class T>
constexpr void destroy_at(T* location);
namespace ranges {
    template<destructible T>
        constexpr void destroy_at(T* location) noexcept;
}

```

1 *Effects:*

- (1.1) — If T is an array type, equivalent to `destroy(begin(*location), end(*location))`.
 (1.2) — Otherwise, equivalent to `location->~T()`.

```
template<class NoThrowForwardIterator>
constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

2 *Effects:* Equivalent to:

```
for (; first != last; ++first)
    destroy_at(addressof(*first));
```

```
namespace ranges {
    template<nothrow_input_iterator I, noexcept_sentinel_for<I> S>
        requires destructible<iter_value_t<I>>
        constexpr I destroy(I first, S last) noexcept;
    template<nothrow_input_range R>
        requires destructible<range_value_t<R>>
        constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}
```

3 *Effects:* Equivalent to:

```
for (; first != last; ++first)
    destroy_at(addressof(*first));
return first;
```

```
template<class NoThrowForwardIterator, class Size>
constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);
```

4 *Effects:* Equivalent to:

```
for (; n > 0; (void)++first, --n)
    destroy_at(addressof(*first));
return first;
```

```
namespace ranges {
    template<nothrow_input_iterator I>
        requires destructible<iter_value_t<I>>
        constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}
```

5 *Effects:* Equivalent to:

```
return destroy(counted_iterator(std::move(first), n), default_sentinel).base();
```

27.12 C library algorithms

[**alg.c.library**]

1 [Note 1: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);
```

2 *Preconditions:* For `qsort`, the objects in the array pointed to by `base` are of trivially copyable type.

3 *Effects:* These functions have the semantics specified in the C standard library.

4 *Throws:* Any exception thrown by `compar` (16.4.6.13).

SEE ALSO: ISO/IEC 9899:2018, 7.22.5

28 Numerics library [numerics]

28.1 General [numerics.general]

- ¹ This Clause describes components that C++ programs may use to perform seminumerical operations.
- 2 The following subclauses describe components for complex number types, random number generation, numeric (*n*-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in [Table 94](#).

Table 94 — Numerics library summary [tab:numerics.summary]

Subclause	Header
28.2 Requirements	
28.3 Floating-point environment	<code><cfenv></code>
28.4 Complex numbers	<code><complex></code>
28.5 Random number generation	<code><random></code>
28.6 Numeric arrays	<code><valarray></code>
28.7 Mathematical functions for floating-point types	<code><cmath>, <cstdlib></code>
28.8 Numbers	<code><numbers></code>

28.2 Numeric type requirements [numeric.requirements]

- 1 The `complex` and `valarray` components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A *numeric type* is a cv-unqualified object type *T* that meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements ([16.4.4.2](#)).²²³
- 2 If any operation on *T* throws an exception the effects are undefined.
- 3 In addition, many member and related functions of `valarray<T>` can be successfully instantiated and will exhibit well-defined behavior if and only if *T* meets additional requirements specified for each such member or related function.
- 4 [*Example 1*: It is valid to instantiate `valarray<complex>`, but `operator>()` will not be successfully instantiated for `valarray<complex>` operands, since `complex` does not have any ordering operators. —*end example*]

28.3 The floating-point environment [cfenv]

28.3.1 Header `<cfenv>` synopsis [cfenv.syn]

#define FE_TOWARDZERO see below // optional
#define FE_UPWARD see below // optional

#define FE_DFL_ENV see below

namespace std {
    // types
    using fenv_t = object type;
    using feexcept_t = object type;
```

²²³ In other words, value types. These include arithmetic types, pointers, the library class `complex`, and instantiations of `valarray` for value types.

```
// functions
int feclearexcept(int except);
int fegetexceptflag(fexcept_t* pflag, int except);
int feraiseexcept(int except);
int fesetexceptflag(const fexcept_t* pflag, int except);
int fetestexcept(int except);

int fegetround();
int fesetround(int mode);

int fegetenv(fenv_t* penv);
int feholdexcept(fenv_t* penv);
int fesetenv(const fenv_t* penv);
int feupdateenv(const fenv_t* penv);
}
```

- ¹ The contents and meaning of the header <cfenv> are the same as the C standard library header <fenv.h>.

[Note 1: This document does not require an implementation to support the FENV_ACCESS pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — end note]

SEE ALSO: ISO/IEC 9899:2018, 7.6

28.3.2 Threads

[cfenv.thread]

- ¹ The floating-point environment has thread storage duration (6.7.5.3). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding **thread** object (33.4.3) or **jthread** object (33.4.4) at the time it constructed the object.

[Note 1: That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation. — end note]

- ² A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

28.4 Complex numbers

[complex.numbers]

28.4.1 General

[complex.numbers.general]

- ¹ The header <complex> defines a class template, and numerous functions for representing and manipulating complex numbers.

- ² The effect of instantiating the template **complex** for any type that is not a cv-unqualified floating-point type (6.8.2) is unspecified. Specializations of **complex** for cv-unqualified floating-point types are trivially copyable literal types (6.8.1).

- ³ If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

- ⁴ If **z** is an lvalue of type *cv complex*<**T**> then:

- (4.1) — the expression **reinterpret_cast**<*cv T*(**&**)**[2]
- (4.2) — **reinterpret_cast**<*cv T*(**&**)**[2][0]** designates the real part of **z**, and
- (4.3) — **reinterpret_cast**<*cv T*(**&**)**[2][1]** designates the imaginary part of **z**.**

Moreover, if **a** is an expression of type *cv complex*<**T**>* and the expression **a**[**i**] is well-defined for an integer expression **i**, then:

- (4.4) — **reinterpret_cast**<*cv T**>(**a**)**[2*i]** designates the real part of **a**[**i**], and
- (4.5) — **reinterpret_cast**<*cv T**>(**a**)**[2*i + 1]** designates the imaginary part of **a**[**i**].

28.4.2 Header <complex> synopsis

[complex.syn]

```
namespace std {

        constexpr complex<long double> operator""il(unsigned long long);
        constexpr complex<double> operator""i(long double);
        constexpr complex<double> operator""i(unsigned long long);
        constexpr complex<float> operator""if(long double);
        constexpr complex<float> operator""if(unsigned long long);
    }
}
}

```

28.4.3 Class template complex

[complex]

```

namespace std {
    template<class T> class complex {
        public:
            using value_type = T;

            constexpr complex(const T& re = T(), const T& im = T());
            constexpr complex(const complex&) = default;
            template<class X> constexpr explicit(see below) complex(const complex<X>&);

            constexpr T real() const;
            constexpr void real(T);
            constexpr T imag() const;
            constexpr void imag(T);

            constexpr complex& operator= (const T&);
            constexpr complex& operator+=(const T&);
            constexpr complex& operator-=(const T&);
            constexpr complex& operator*=(const T&);
            constexpr complex& operator/=(const T&);

            constexpr complex& operator=(const complex&);
            template<class X> constexpr complex& operator= (const complex<X>&);
            template<class X> constexpr complex& operator+=(const complex<X>&);
            template<class X> constexpr complex& operator-=(const complex<X>&);
            template<class X> constexpr complex& operator*=(const complex<X>&);
            template<class X> constexpr complex& operator/=(const complex<X>&);
    };
}

```

- ¹ The class `complex` describes an object that can store the Cartesian components, `real()` and `imag()`, of a complex number.

28.4.4 Member functions

[complex.members]

```
constexpr complex(const T& re = T(), const T& im = T());
```

- ¹ *Postconditions:* `real() == re && imag() == im` is true.

```
template<class X> constexpr explicit(see below) complex(const complex<X>& other);
```

- ² *Effects:* Initializes the real part with `other.real()` and the imaginary part with `other.imag()`.

- ³ *Remarks:* The expression inside `explicit` evaluates to `false` if and only if the floating-point conversion rank of `T` is greater than or equal to the floating-point conversion rank of `X`.

```
constexpr T real() const;
```

- ⁴ *Returns:* The value of the real component.

```
constexpr void real(T val);
5   Effects: Assigns val to the real component.

constexpr T imag() const;
6   Returns: The value of the imaginary component.

constexpr void imag(T val);
7   Effects: Assigns val to the imaginary component.
```

28.4.5 Member operators

[complex.member.ops]

```
constexpr complex& operator+=(const T& rhs);
1   Effects: Adds the scalar value rhs to the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

2   Returns: *this.

constexpr complex& operator-=(const T& rhs);
3   Effects: Subtracts the scalar value rhs from the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

4   Returns: *this.

constexpr complex& operator*=(const T& rhs);
5   Effects: Multiplies the scalar value rhs by the complex value *this and stores the result in *this.

6   Returns: *this.

constexpr complex& operator/=(const T& rhs);
7   Effects: Divides the scalar value rhs into the complex value *this and stores the result in *this.

8   Returns: *this.

template<class X> constexpr complex& operator=(const complex<X>& rhs);
9   Effects: Assigns the value rhs.real() to the real part and the value rhs.imag() to the imaginary part of the complex value *this.

10  Returns: *this.

template<class X> constexpr complex& operator+=(const complex<X>& rhs);
11  Effects: Adds the complex value rhs to the complex value *this and stores the sum in *this.

12  Returns: *this.

template<class X> constexpr complex& operator-=(const complex<X>& rhs);
13  Effects: Subtracts the complex value rhs from the complex value *this and stores the difference in *this.

14  Returns: *this.

template<class X> constexpr complex& operator*=(const complex<X>& rhs);
15  Effects: Multiplies the complex value rhs by the complex value *this and stores the product in *this.

16  Returns: *this.

template<class X> constexpr complex& operator/=(const complex<X>& rhs);
17  Effects: Divides the complex value rhs into the complex value *this and stores the quotient in *this.

18  Returns: *this.
```

28.4.6 Non-member operations

[complex.ops]

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
1   Returns: complex<T>(lhs).
```

```

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);

2     Returns: complex<T>(lhs) += rhs.

template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
3     Returns: complex<T>(-lhs.real(), -lhs.imag());

template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);

4     Returns: complex<T>(lhs) -= rhs.

template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);

5     Returns: complex<T>(lhs) *= rhs.

template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);

6     Returns: complex<T>(lhs) /= rhs.

template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);

7     Returns: lhs.real() == rhs.real() && lhs.imag() == rhs.imag().

8     Remarks: The imaginary part is assumed to be T(), or 0.0, for the T arguments.

template<class T, class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);

9     Preconditions: The input values are convertible to T.

10    Effects: Extracts a complex number x of the form: u, (u), or (u,v), where u is the real part and v is
        the imaginary part (31.7.5.3).

11    If bad input is encountered, calls is.setstate(ios_base::failbit) (which may throw ios_base::failure
        (31.5.4.4)).

12    Returns: is.

13    Remarks: This extraction is performed as a series of simpler extractions. Therefore, the skipping of
        whitespace is specified to be the same for each of the simpler extractions.

template<class T, class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);

14    Effects: Inserts the complex number x onto the stream o as if it were implemented as follows:

        basic_ostringstream<charT, traits> s;
        s.flags(o.flags());
        s.imbue(o.getloc());
        s.precision(o.precision());
        s << '(' << x.real() << ',' << x.imag() << ')';
        return o << s.str();

15    [Note 1: In a locale in which comma is used as a decimal point character, the use of comma as a field separator
        can be ambiguous. Inserting showpoint into the output stream forces all outputs to show an explicit decimal
        point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. —end
        note]
```

28.4.7 Value operations

[**complex.value.ops**]

```

template<class T> constexpr T real(const complex<T>& x);

1     Returns: x.real().
```

```

template<class T> constexpr T imag(const complex<T>& x);

2   Returns: x.imag().

template<class T> constexpr T abs(const complex<T>& x);

3   Returns: The magnitude of x.

template<class T> constexpr T arg(const complex<T>& x);

4   Returns: The phase angle of x, or atan2(imag(x), real(x)).

template<class T> constexpr T norm(const complex<T>& x);

5   Returns: The squared magnitude of x.

template<class T> constexpr complex<T> conj(const complex<T>& x);

6   Returns: The complex conjugate of x.

template<class T> constexpr complex<T> proj(const complex<T>& x);

7   Returns: The projection of x onto the Riemann sphere.

8   Remarks: Behaves the same as the C function cproj. SEE ALSO: ISO/IEC 9899:2018, 7.3.9.5

template<class T> constexpr complex<T> polar(const T& rho, const T& theta = T());

9   Preconditions: rho is non-negative and non-NaN. theta is finite.

10  Returns: The complex value corresponding to a complex number whose magnitude is rho and whose
    phase angle is theta.

```

28.4.8 Transcendentals

[complex.transcendentals]

```

template<class T> constexpr complex<T> acos(const complex<T>& x);

1   Returns: The complex arc cosine of x.

2   Remarks: Behaves the same as the C function cacos. SEE ALSO: ISO/IEC 9899:2018, 7.3.5.1

template<class T> constexpr complex<T> asin(const complex<T>& x);

3   Returns: The complex arc sine of x.

4   Remarks: Behaves the same as the C function casin. SEE ALSO: ISO/IEC 9899:2018, 7.3.5.2

template<class T> constexpr complex<T> atan(const complex<T>& x);

5   Returns: The complex arc tangent of x.

6   Remarks: Behaves the same as the C function catan. SEE ALSO: ISO/IEC 9899:2018, 7.3.5.3

template<class T> constexpr complex<T> acosh(const complex<T>& x);

7   Returns: The complex arc hyperbolic cosine of x.

8   Remarks: Behaves the same as the C function cacosh. SEE ALSO: ISO/IEC 9899:2018, 7.3.6.1

template<class T> constexpr complex<T> asinh(const complex<T>& x);

9   Returns: The complex arc hyperbolic sine of x.

10  Remarks: Behaves the same as the C function casinh. SEE ALSO: ISO/IEC 9899:2018, 7.3.6.2

template<class T> constexpr complex<T> atanh(const complex<T>& x);

11  Returns: The complex arc hyperbolic tangent of x.

12  Remarks: Behaves the same as the C function catanh. SEE ALSO: ISO/IEC 9899:2018, 7.3.6.3

template<class T> constexpr complex<T> cos(const complex<T>& x);

13  Returns: The complex cosine of x.

template<class T> constexpr complex<T> cosh(const complex<T>& x);

14  Returns: The complex hyperbolic cosine of x.

```

```

template<class T> constexpr complex<T> exp(const complex<T>& x);
15   Returns: The complex base-e exponential of x.

template<class T> constexpr complex<T> log(const complex<T>& x);
16   Returns: The complex natural (base-e) logarithm of x. For all x, imag(log(x)) lies in the interval
               $[-\pi, \pi]$ .
              [Note 1: The semantics of this function are intended to be the same in C++ as they are for clog in C. — end
               note]

17   Remarks: The branch cuts are along the negative real axis.

template<class T> constexpr complex<T> log10(const complex<T>& x);
18   Returns: The complex common (base-10) logarithm of x, defined as log(x) / log(10).
19   Remarks: The branch cuts are along the negative real axis.

template<class T> constexpr complex<T> pow(const complex<T>& x, const complex<T>& y);
template<class T> constexpr complex<T> pow(const complex<T>& x, const T& y);
template<class T> constexpr complex<T> pow(const T& x, const complex<T>& y);

20   Returns: The complex power of base x raised to the yth power, defined as exp(y * log(x)). The
              value returned for pow(0, 0) is implementation-defined.

21   Remarks: The branch cuts are along the negative real axis.

template<class T> constexpr complex<T> sin(const complex<T>& x);
22   Returns: The complex sine of x.

template<class T> constexpr complex<T> sinh(const complex<T>& x);
23   Returns: The complex hyperbolic sine of x.

template<class T> constexpr complex<T> sqrt(const complex<T>& x);
24   Returns: The complex square root of x, in the range of the right half-plane.
              [Note 2: The semantics of this function are intended to be the same in C++ as they are for csqrt in C. — end
               note]

25   Remarks: The branch cuts are along the negative real axis.

template<class T> constexpr complex<T> tan(const complex<T>& x);
26   Returns: The complex tangent of x.

template<class T> constexpr complex<T> tanh(const complex<T>& x);
27   Returns: The complex hyperbolic tangent of x.

```

28.4.9 Additional overloads

[cmplx.over]

- ¹ The following function templates have additional `constexpr` overloads:

<code>arg</code>	<code>norm</code>
<code>conj</code>	<code>proj</code>
<code>imag</code>	<code>real</code>

- ² The additional `constexpr` overloads are sufficient to ensure:

- (2.1) — If the argument has a floating-point type T, then it is effectively cast to `complex<T>`.
- (2.2) — Otherwise, if the argument has integer type, then it is effectively cast to `complex<double>`.

- ³ Function template `pow` has additional `constexpr` overloads sufficient to ensure, for a call with one argument of type `complex<T1>` and the other argument of type T2 or `complex<T2>`, both arguments are effectively cast to `complex<common_type_t<T1, T2>>`. If `common_type_t<T1, T2>` is not well-formed, then the program is ill-formed.

28.4.10 Suffixes for complex number literals

[complex.literals]

- ¹ This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);
```

- ² Returns: `complex<long double>{0.0L, static_cast<long double>(d)}`.

```
constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);
```

- ³ Returns: `complex<double>{0.0, static_cast<double>(d)}`.

```
constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);
```

- ⁴ Returns: `complex<float>{0.0f, static_cast<float>(d)}`.

28.5 Random number generation

[rand]

28.5.1 General

[rand.general]

- ¹ Subclause 28.5 defines a facility for generating (pseudo-)random numbers.

- ² In addition to a few utilities, four categories of entities are described: *uniform random bit generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

[*Note 1*: These entities are specified in such a way as to permit the binding of any uniform random bit generator object `e` as the argument to any random number distribution object `d`, thus producing a zero-argument function object such as given by `bind(d, e)`. — *end note*]

- ³ Each of the entities specified in 28.5 has an associated arithmetic type (6.8.2) identified as `result_type`. With `T` as the `result_type` thus associated with such an entity, that entity is characterized:

- (3.1) — as *boolean* or equivalently as *boolean-valued*, if `T` is `bool`;
- (3.2) — otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is `true`;
- (3.3) — otherwise as *floating-point* or equivalently as *real-valued*.

If integer-valued, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

- ⁴ Unless otherwise specified, all descriptions of calculations in 28.5 use mathematical real numbers.

- ⁵ Throughout 28.5, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:

- (5.1) — the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and
- (5.2) — the operator `lshiftw` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo 2^w .

28.5.2 Header <random> synopsis

[rand.synopsis]

```
#include <initializer_list>      // see 17.10.2

namespace std {
    // 28.5.3.3, uniform random bit generator requirements
    template<class G>
        concept uniform_random_bit_generator = see below;

    // 28.5.4.2, class template linear_congruential_engine
    template<class UIntType, UIntType a, UIntType c, UIntType m>
        class linear_congruential_engine;
```

```

// 28.5.4.3, class template mersenne_twister_engine
template<class UIntType, size_t w, size_t n, size_t m, size_t r,
          UIntType a, size_t u, UIntType d, size_t s,
          UIntType b, size_t t,
          UIntType c, size_t l, UIntType f>
    class mersenne_twister_engine;

// 28.5.4.4, class template subtract_with_carry_engine
template<class UIntType, size_t w, size_t s, size_t r>

28.5.3 Requirements

[rand.req]

28.5.3.1 General requirements

[rand.req.genl]

- ¹ Throughout this subclause 28.5, the effect of instantiating a template:
 - (1.1) — that has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (28.5.3.2).
 - (1.2) — that has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (28.5.3.3).
 - (1.3) — that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (28.5.3.4).
 - (1.4) — that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.
 - (1.5) — that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
 - (1.6) — that has a template type parameter named `UIIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.
- 2 Throughout this subclause 28.5, phrases of the form “`x` is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “`x` is a value of a type meeting the requirements of the specified iterator type”.
- 3 Throughout this subclause 28.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared `explicit`.

28.5.3.2 Seed sequence requirements

[rand.req.seedseq]

- ¹ A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values i , $0 \leq i < 2^{32}$, based on the consumed data.
[Note 1: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — end note]
- 2 A class `S` meets the requirements of a seed sequence if the expressions shown in Table 95 are valid and have the indicated semantics, and if `S` also meets all other requirements of this subclause 28.5.3.2. In that Table and throughout this subclause:
 - (2.1) — `T` is the type named by `S`'s associated `result_type`;
 - (2.2) — `q` is a value of type `S` and `r` is a value of type `S` or `const S`;
 - (2.3) — `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;
 - (2.4) — `rb` and `re` are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;
 - (2.5) — `ob` is an output iterator; and
 - (2.6) — `il` is a value of type `initializer_list<T>`.

Table 95 — Seed sequence requirements [tab:rand.req.seedseq]

Expression	Return type	Pre/post-condition	Complexity
<code>S::result_type</code>	<code>T</code>	<code>T</code> is an unsigned integer type (6.8.2) of at least 32 bits.	compile-time
<code>S()</code>		Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type <code>S</code> .	constant
<code>S(ib, ie)</code>		Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence [<code>ib</code> , <code>ie</code>].	$\mathcal{O}(ie - ib)$

Table 95 — Seed sequence requirements (continued)

Expression	Return type	Pre/post-condition	Complexity
<code>S(il)</code>		Same as <code>S(il.begin(), il.end())</code> .	same as <code>S(il.begin(), il.end())</code>
<code>q.generate(rb,re)</code>	<code>void</code>	Does nothing if <code>rb == re</code> . Otherwise, fills the supplied sequence <code>[rb, re)</code> with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of <code>generate</code> 's previous invocations.	$\mathcal{O}(re - rb)$
<code>r.size()</code>	<code>size_t</code>	The number of 32-bit units that would be copied by a call to <code>r.param</code> .	constant
<code>r.param(ob)</code>	<code>void</code>	Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type <code>S</code> , and that would reproduce in that second object a state indistinguishable from the state of the first object.	$\mathcal{O}(r.size())$

28.5.3.3 Uniform random bit generator requirements

[rand.req.urng]

- ¹ A *uniform random bit generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

[Note 1: The degree to which `g`'s results approximate the ideal is often determined statistically. — *end note*]

```
template<class G>
concept uniform_random_bit_generator =
    invocable<G&> && unsigned_integral<invoke_result_t<G&>> &&
    requires {
        { G::min() } -> same_as<invoke_result_t<G&>>;
        { G::max() } -> same_as<invoke_result_t<G&>>;
        requires bool_constant<(G::min() < G::max())>::value;
    };
```

- ² Let `g` be an object of type `G`. `G` models `uniform_random_bit_generator` only if

- (2.1) — `G::min() <= g()`,
- (2.2) — `g() <= G::max()`, and
- (2.3) — `g()` has amortized constant complexity.

- ³ A class `G` meets the *uniform random bit generator* requirements if `G` models `uniform_random_bit_generator`, `invoke_result_t<G&>` is an unsigned integer type (6.8.2), and `G` provides a nested `typedef-name result_type` that denotes the same type as `invoke_result_t<G&>`.

28.5.3.4 Random number engine requirements

[rand.req.eng]

- ¹ A *random number engine* (commonly shortened to *engine*) `e` of type `E` is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.
- ² At any given time, `e` has a state `ei` for some integer $i \geq 0$. Upon construction, `e` has an initial state `e0`. An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.
- ³ `E`'s specification shall define:
 - (3.1) — the size of `E`'s state in multiples of the size of `result_type`, given as an integral constant expression;

- (3.2) — the *transition algorithm* TA by which e's state e_i is advanced to its *successor state* e_{i+1} ; and
- (3.3) — the *generation algorithm* GA by which an engine's state is mapped to a value of type `result_type`.
- ⁴ A class E that meets the requirements of a uniform random bit generator (28.5.3.3) also meets the requirements of a *random number engine* if the expressions shown in Table 96 are valid and have the indicated semantics, and if E also meets all other requirements of this subclause 28.5.3.4. In that Table and throughout this subclause:
- (4.1) — T is the type named by E's associated `result_type`;
 - (4.2) — e is a value of E, v is an lvalue of E, x and y are (possibly const) values of E;
 - (4.3) — s is a value of T;
 - (4.4) — q is an lvalue meeting the requirements of a seed sequence (28.5.3.2);
 - (4.5) — z is a value of type `unsigned long long`;
 - (4.6) — os is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
 - (4.7) — is is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 23 and Clause 31.

Table 96 — Random number engine requirements [tab:rand.req.eng]

Expression	Return type	Pre/post-condition	Complexity
E()		Creates an engine with the same initial state as all other default-constructed engines of type E.	$\mathcal{O}(\text{size of state})$
E(x)		Creates an engine that compares equal to x.	$\mathcal{O}(\text{size of state})$
E(s)		Creates an engine with initial state determined by s.	$\mathcal{O}(\text{size of state})$
E(q) ²²⁴		Creates an engine with an initial state that depends on a sequence produced by one call to q.generate.	same as complexity of q.generate called on a sequence whose length is size of state
e.seed()	void	Postconditions: e == E().	same as E()
e.seed(s)	void	Postconditions: e == E(s).	same as E(s)
e.seed(q)	void	Postconditions: e == E(q).	same as E(q)
e()	T	Advances e's state e_i to $e_{i+1} = \text{TA}(e_i)$ and returns $\text{GA}(e_i)$.	per 28.5.3.3
e.discard(z) ²²⁵	void	Advances e's state e_i to e_{i+z} by any means equivalent to z consecutive calls e().	no worse than the complexity of z consecutive calls e()
x == y	bool	This operator is an equivalence relation. With S_x and S_y as the infinite sequences of values that would be generated by repeated future calls to x() and y(), respectively, returns <code>true</code> if $S_x = S_y$; else returns <code>false</code> .	$\mathcal{O}(\text{size of state})$
x != y	bool	$!(x == y)$.	$\mathcal{O}(\text{size of state})$

²²⁴) This constructor (as well as the subsequent corresponding `seed()` function) can be particularly useful to applications requiring a large number of independent random sequences.

²²⁵) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes z consecutive calls e().

Expression	Return type	Pre/post-condition	Complexity
<code>os << x</code>	reference to the type of <code>os</code>	With <code>os.fmtflags</code> set to <code>ios_-base::dec ios_base::left</code> and the fill character set to the space character, writes to <code>os</code> the textual representation of <code>x</code> 's current state. In the output, adjacent numbers are separated by one or more space characters. <i>Postconditions:</i> The <code>os.fmtflags</code> and fill character are unchanged.	$\mathcal{O}(\text{size of state})$
<code>is >> v</code>	reference to the type of <code>is</code>	With <code>is.fmtflags</code> set to <code>ios_base::dec</code> , sets <code>v</code> 's state as determined by reading its textual representation from <code>is</code> . If bad input is encountered, ensures that <code>v</code> 's state is unchanged by the operation and calls <code>is.setstate(ios_base::failbit)</code> (which may throw <code>ios_base::failure (31.5.4.4)</code>). If a textual representation written via <code>os << x</code> was subsequently read via <code>is >> v</code> , then <code>x == v</code> provided that there have been no intervening invocations of <code>x</code> or of <code>v</code> . <i>Preconditions:</i> <code>is</code> provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of <code>is</code> , and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were respectively the same as those of <code>is</code> . <i>Postconditions:</i> The <code>is.fmtflags</code> are unchanged.	$\mathcal{O}(\text{size of state})$

- ⁵ E shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. These operations shall each be of complexity no worse than $\mathcal{O}(\text{size of state})$.

28.5.3.5 Random number engine adaptor requirements

[rand.req.adapt]

- 1 A *random number engine adaptor* (commonly shortened to *adaptor*) `a` of type `A` is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine `b` of type `B` adapted in this way is termed a *base engine* in this context. The expression `a.base()` shall be valid and shall return a const reference to `a`'s base engine.
- 2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

`A::A();`

- 3 *Effects:* The base engine is initialized as if by its default constructor.

```
bool operator==(const A& a1, const A& a2);
```

- 4 *Returns:* true if `a1`'s base engine is equal to `a2`'s base engine. Otherwise returns false.

```

A::A(result_type s);
5   Effects: The base engine is initialized with s.

template<class Sseq> A::A(Sseq& q);
6   Effects: The base engine is initialized with q.

void seed();
7   Effects: With b as the base engine, invokes b.seed().

void seed(result_type s);
8   Effects: With b as the base engine, invokes b.seed(s).

template<class Sseq> void seed(Sseq& q);
9   Effects: With b as the base engine, invokes b.seed(q).

```

10 A shall also meet the following additional requirements:

- (10.1) — The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.
- (10.2) — The state of A shall include the state of its base engine. The size of A's state shall be no less than the size of the base engine.
- (10.3) — Copying A's state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of A.
- (10.4) — The textual representation of A shall include the textual representation of its base engine.

28.5.3.6 Random number distribution requirements

[rand.req.dist]

1 A *random number distribution* (commonly shortened to *distribution*) d of type D is a function object returning values that are distributed according to an associated mathematical *probability density function* $p(z)$ or according to an associated *discrete probability function* $P(z_i)$. A distribution's specification identifies its associated probability function $p(z)$ or $P(z_i)$.

2 An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example, $p(z | a, b)$ or $P(z_i | a, b)$, to name specific parameters, or by writing, for example, $p(z | \{p\})$ or $P(z_i | \{p\})$, to denote a distribution's parameters p taken as a whole.

3 A class D meets the requirements of a *random number distribution* if the expressions shown in [Table 97](#) are valid and have the indicated semantics, and if D and its associated types also meet all other requirements of this subclause [28.5.3.6](#). In that Table and throughout this subclause,

- (3.1) — T is the type named by D's associated `result_type`;
- (3.2) — P is the type named by D's associated `param_type`;
- (3.3) — d is a value of D, and x and y are (possibly const) values of D;
- (3.4) — glb and lub are values of T respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by d's `operator()`, as determined by the current values of d's parameters;
- (3.5) — p is a (possibly const) value of P;
- (3.6) — g, g1, and g2 are lvalues of a type meeting the requirements of a uniform random bit generator ([28.5.3.3](#));
- (3.7) — os is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
- (3.8) — is is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to [Clause 23](#) and [Clause 31](#).

Table 97 — Random number distribution requirements [tab:rand.req.dist]

Expression	Return type	Pre/post-condition	Complexity
D::result_type	T	T is an arithmetic type (6.8.2).	compile-time
D::param_type	P		compile-time

Expression	Return type	Pre/post-condition	Complexity
D()		Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type D.	constant
D(p)		Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct p.	same as p's construction
d.reset()	void	Subsequent uses of d do not depend on values produced by any engine prior to invoking reset.	constant
x.param()	P	Returns a value p such that D(p).param() == p.	no worse than the complexity of D(p)
d.param(p)	void	<i>Postconditions:</i> d.param() == p.	no worse than the complexity of D(p)
d(g)	T	With p = d.param(), the sequence of numbers returned by successive invocations with the same object g is randomly distributed according to the associated $p(z \{p\})$ or $P(z_i \{p\})$ function.	amortized constant number of invocations of g
d(g,p)	T	The sequence of numbers returned by successive invocations with the same objects g and p is randomly distributed according to the associated $p(z \{p\})$ or $P(z_i \{p\})$ function.	amortized constant number of invocations of g
x.min()	T	Returns glb.	constant
x.max()	T	Returns lub.	constant
x == y	bool	This operator is an equivalence relation. Returns true if x.param() == y.param() and $S_1 = S_2$, where S_1 and S_2 are the infinite sequences of values that would be generated, respectively, by repeated future calls to x(g1) and y(g2) whenever g1 == g2. Otherwise returns false.	constant
x != y	bool	$!(x == y).$	same as x == y.
os << x	reference to the type of os	Writes to os a textual representation for the parameters and the additional internal data of x. <i>Postconditions:</i> The os.fmtflags and fill character are unchanged.	

Expression	Return type	Pre/post-condition	Complexity
<code>is >> d</code>	reference to the type of <code>is</code>	Restores from <code>is</code> the parameters and additional internal data of the lvalue <code>d</code> . If bad input is encountered, ensures that <code>d</code> is unchanged by the operation and calls <code>is.setstate(ios_- base::failbit)</code> (which may throw <code>ios_base::failure (31.5.4.4)</code>). <i>Preconditions:</i> <code>is</code> provides a textual representation that was previously written using an <code>os</code> whose imbued locale and whose type's template specialization arguments <code>charT</code> and <code>traits</code> were the same as those of <code>is</code> . <i>Postconditions:</i> The <code>is(fmtflags</code> are unchanged.	

- ⁴ D shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements.
 - ⁵ The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of D between any of the invocations of `d(g)`.
 - ⁶ If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.
 - ⁷ It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 28.5, declarations of `D::param_type` are in the form of `typedefs` for convenience of exposition only.
 - ⁸ P shall meet the *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17EqualityComparable* (Table 28) requirements.
 - ⁹ For each of the constructors of D taking arguments corresponding to parameters of the distribution, P shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of D that return values corresponding to parameters of the distribution, P shall have a corresponding member function with the identical name, type, and semantics.
 - ¹⁰ P shall have a declaration of the form

```
using distribution_type = D;
```
- 28.5.4 Random number engine class templates** [rand.eng]
- 28.5.4.1 General** [rand.eng.general]
- ¹ Each type instantiated from a class template specified in 28.5.4 meets the requirements of a random number engine (28.5.3.4) type.
 - ² Except where specified otherwise, the complexity of each function specified in 28.5.4 is constant.
 - ³ Except where specified otherwise, no function described in 28.5.4 throws an exception.
 - ⁴ Every function described in 28.5.4 that has a function parameter q of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.
 - ⁵ Descriptions are provided in 28.5.4 only for engine operations that are not described in 28.5.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

- ⁶ Each template specified in 28.5.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.
- ⁷ For every random number engine and for every random number engine adaptor X defined in 28.5.4 and in 28.5.5:

(7.1) — if the constructor

```
template<class Sseq> explicit X(Sseq& q);
```

is called with a type Sseq that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function

```
template<class Sseq> void seed(Sseq& q);
```

is called with a type Sseq that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to X::result_type.

28.5.4.2 Class template linear_congruential_engine

[rand.eng.lcong]

- ¹ A linear_congruential_engine random number engine produces unsigned integer random numbers. The state x_i of a linear_congruential_engine object x is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form $TA(x_i) = (a \cdot x_i + c) \bmod m$; the generation algorithm is $GA(x_i) = x_{i+1}$.

```
namespace std {
    template<class UIntType, UIntType a, UIntType c, UIntType m>
    class linear_congruential_engine {
        public:
            // types
            using result_type = UIntType;

            // engine characteristics
            static constexpr result_type multiplier = a;
            static constexpr result_type increment = c;
            static constexpr result_type modulus = m;
            static constexpr result_type min() { return c == 0u ? 1u : 0u; }
            static constexpr result_type max() { return m - 1u; }
            static constexpr result_type default_seed = 1u;

            // constructors and seeding functions
            linear_congruential_engine() : linear_congruential_engine(default_seed) {}
            explicit linear_congruential_engine(result_type s);
            template<class Sseq> explicit linear_congruential_engine(Sseq& q);
            void seed(result_type s = default_seed);
            template<class Sseq> void seed(Sseq& q);

            // equality operators
            friend bool operator==(const linear_congruential_engine& x,
                                  const linear_congruential_engine& y);

            // generating functions
            result_type operator()();
            void discard(unsigned long long z);

            // inserters and extractors
            template<class charT, class traits>
                friend basic_ostream<charT, traits>&
                    operator<<(basic_ostream<charT, traits>& os, const linear_congruential_engine& x);
            template<class charT, class traits>
                friend basic_istream<charT, traits>&
                    operator>>(basic_istream<charT, traits>& is, linear_congruential_engine& x);
    };
}
```

```
    };
}
```

- 2 If the template parameter m is 0, the modulus m used throughout this subclause 28.5.4.2 is `numeric_limits<result_type>::max()` plus 1.

[Note 1: m need not be representable as a value of type `result_type`. —end note]

- 3 If the template parameter m is not 0, the following relations shall hold: $a < m$ and $c < m$.

- 4 The textual representation consists of the value of x_i .

```
explicit linear_congruential_engine(result_type s);
```

- 5 *Effects:* If $c \bmod m$ is 0 and $s \bmod m$ is 0, sets the engine's state to 1, otherwise sets the engine's state to $s \bmod m$.

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

- 6 *Effects:* With $k = \lceil \frac{\log_2 m}{32} \rceil$ and a an array (or equivalent) of length $k + 3$, invokes `q.generate(a + 0, a + k + 3)` and then computes $S = \left(\sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j} \right) \bmod m$. If $c \bmod m$ is 0 and S is 0, sets the engine's state to 1, else sets the engine's state to S .

28.5.4.3 Class template `mersenne_twister_engine`

[rand.eng.mers]

- 1 A `mersenne_twister_engine` random number engine²²⁶ produces unsigned integer random numbers in the closed interval $[0, 2^w - 1]$. The state x_i of a `mersenne_twister_engine` object `x` is of size n and consists of a sequence X of n values of the type delivered by `x`; all subscripts applied to X are to be taken modulo n .
- 2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values n and m , a twist value r , and a conditional xor-mask a . To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values u, d, s, b, t, c , and ℓ .

The state transition is performed as follows:

- (2.1) — Concatenate the upper $w - r$ bits of X_{i-n} with the lower r bits of X_{i+1-n} to obtain an unsigned integer value Y .
- (2.2) — With $\alpha = a \cdot (Y \text{ bitand } 1)$, set X_i to $X_{i+m-n} \text{ xor } (Y \text{ rshift } 1) \text{ xor } \alpha$.

The sequence X is initialized with the help of an initialization multiplier f .

- 3 The generation algorithm determines the unsigned integer values z_1, z_2, z_3, z_4 as follows, then delivers z_4 as its result:

- (3.1) — Let $z_1 = X_i \text{ xor } ((X_i \text{ rshift } u) \text{ bitand } d)$.
- (3.2) — Let $z_2 = z_1 \text{ xor } ((z_1 \text{ lshift}_w s) \text{ bitand } b)$.
- (3.3) — Let $z_3 = z_2 \text{ xor } ((z_2 \text{ lshift}_w t) \text{ bitand } c)$.
- (3.4) — Let $z_4 = z_3 \text{ xor } (z_3 \text{ rshift } \ell)$.

```
namespace std {
    template<class UIntType, size_t w, size_t n, size_t m, size_t r,
              UIntType a, size_t u, UIntType d, size_t s,
              UIntType b, size_t t,
              UIntType c, size_t l, UIntType f>
    class mersenne_twister_engine {
        public:
            // types
            using result_type = UIntType;

            // engine characteristics
            static constexpr size_t word_size = w;
            static constexpr size_t state_size = n;
            static constexpr size_t shift_size = m;
            static constexpr size_t mask_bits = r;
```

²²⁶) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```

static constexpr UIntType xor_mask = a;
static constexpr size_t tempering_u = u;
static constexpr UIntType tempering_d = d;
static constexpr size_t tempering_s = s;
static constexpr UIntType tempering_b = b;
static constexpr size_t tempering_t = t;
static constexpr UIntType tempering_c = c;
static constexpr size_t tempering_l = l;
static constexpr UIntType initialization_multiplier = f;
static constexpr result_type min() { return 0; }
static constexpr result_type max() { return 2w - 1; }
static constexpr result_type default_seed = 5489u;

// constructors and seeding functions
mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
explicit mersenne_twister_engine(result_type value);
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const mersenne_twister_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, mersenne_twister_engine& x);
};

}

```

- ⁴ The following relations shall hold: $0 < m, m \leq n, 2u < w, r \leq w, u \leq w, s \leq w, t \leq w, l \leq w, w \leq \text{numeric_limits<} \text{UIntType} \text{>}::\text{digits}, a \leq (1u \ll w) - 1u, b \leq (1u \ll w) - 1u, c \leq (1u \ll w) - 1u, d \leq (1u \ll w) - 1u$, and $f \leq (1u \ll w) - 1u$.
- ⁵ The textual representation of x_i consists of the values of X_{i-n}, \dots, X_{i-1} , in that order.

explicit mersenne_twister_engine(result_type value);

- ⁶ *Effects:* Sets X_{-n} to $\text{value} \bmod 2^w$. Then, iteratively for $i = 1 - n, \dots, -1$, sets X_i to

$$[f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w - 2))) + i \bmod n] \bmod 2^w.$$

- ⁷ *Complexity:* $\mathcal{O}(n)$.

template<class Sseq> explicit mersenne_twister_engine(Sseq& q);

- ⁸ *Effects:* With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $n \cdot k$, invokes $q.\text{generate}(a + 0, a + n \cdot k)$ and then, iteratively for $i = -n, \dots, -1$, sets X_i to $(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j}) \bmod 2^w$. Finally, if the most significant $w - r$ bits of X_{-n} are zero, and if each of the other resulting X_i is 0, changes X_{-n} to 2^{w-1} .

28.5.4.4 Class template subtract_with_carry_engine

[rand.eng.sub]

- ¹ A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.
- ² The state x_i of a `subtract_with_carry_engine` object x is of size $\mathcal{O}(r)$, and consists of a sequence X of r integer values $0 \leq X_i < m = 2^w$; all subscripts applied to X are to be taken modulo r . The state x_i additionally consists of an integer c (known as the *carry*) whose value is either 0 or 1.
- ³ The state transition is performed as follows:

- (3.1) — Let $Y = X_{i-s} - X_{i-r} - c$.
- (3.2) — Set X_i to $y = Y \bmod m$. Set c to 1 if $Y < 0$, otherwise set c to 0.

[Note 1: This algorithm corresponds to a modular linear function of the form $\text{TA}(x_i) = (a \cdot x_i) \bmod b$, where b is of the form $m^r - m^s + 1$ and $a = b - (b - 1)/m$. — end note]

- 4 The generation algorithm is given by $\text{GA}(x_i) = y$, where y is the value produced as a result of advancing the engine's state as described above.

```
namespace std {
    template<class UIntType, size_t w, size_t s, size_t r>
    class subtract_with_carry_engine {
        public:
            // types
            using result_type = UIntType;

            // engine characteristics
            static constexpr size_t word_size = w;
            static constexpr size_t short_lag = s;
            static constexpr size_t long_lag = r;
            static constexpr result_type min() { return 0; }
            static constexpr result_type max() { return m - 1; }
            static constexpr result_type default_seed = 19780503u;

            // constructors and seeding functions
            subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
            explicit subtract_with_carry_engine(result_type value);
            template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
            void seed(result_type value = default_seed);
            template<class Sseq> void seed(Sseq& q);

            // equality operators
            friend bool operator==(const subtract_with_carry_engine& x,
                                   const subtract_with_carry_engine& y);

            // generating functions
            result_type operator()();
            void discard(unsigned long long z);

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const subtract_with_carry_engine& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, subtract_with_carry_engine& x);
    };
}
```

- 5 The following relations shall hold: $0u < s$, $s < r$, $0 < w$, and $w \leq \text{numeric_limits<} \text{UIntType} \text{>} :: \text{digits}$.
- 6 The textual representation consists of the values of X_{i-r}, \dots, X_{i-1} , in that order, followed by c .

```
explicit subtract_with_carry_engine(result_type value);
```

- 7 *Effects:* Sets the values of X_{-r}, \dots, X_{-1} , in that order, as specified below. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

To set the values X_k , first construct e , a `linear_congruential_engine` object, as if by the following definition:

```
linear_congruential_engine<result_type,
                           40014u, 0u, 2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each X_k , obtain new values z_0, \dots, z_{n-1} from $n = \lceil w/32 \rceil$ successive invocations of e . Set X_k to $\left(\sum_{j=0}^{n-1} z_j \cdot 2^{32j} \right) \bmod m$.

- 8 *Complexity:* Exactly $n \cdot r$ invocations of e .

```
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

- 9 *Effects:* With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $r \cdot k$, invokes $q.\text{generate}(a + 0, a + r \cdot k)$ and then, iteratively for $i = -r, \dots, -1$, sets X_i to $\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j} \right) \bmod m$. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

28.5.5 Random number engine adaptor class templates

[rand.adapt]

28.5.5.1 In general

[rand.adapt.general]

- 1 Each type instantiated from a class template specified in this subclause 28.5.5 meets the requirements of a random number engine adaptor (28.5.3.5) type.
- 2 Except where specified otherwise, the complexity of each function specified in this subclause 28.5.5 is constant.
- 3 Except where specified otherwise, no function described in this subclause 28.5.5 throws an exception.
- 4 Every function described in this subclause 28.5.5 that has a function parameter q of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of $q.\text{generate}$ throws.
- 5 Descriptions are provided in this subclause 28.5.5 only for adaptor operations that are not described in subclause 28.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- 6 Each template specified in this subclause 28.5.5 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

28.5.5.2 Class template `discard_block_engine`

[rand.adapt.disc]

- 1 A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine e . The state x_i of a `discard_block_engine` engine adaptor object x consists of the state e_i of its base engine e and an additional integer n . The size of the state is the size of e 's state plus 1.
- 2 The transition algorithm discards all but $r > 0$ values from each block of $p \geq r$ values delivered by e . The state transition is performed as follows: If $n \geq r$, advance the state of e from e_i to e_{i+p-r} and set n to 0. In any case, then increment n and advance e 's then-current state e_j to e_{j+1} .
- 3 The generation algorithm yields the value returned by the last invocation of $e()$ while advancing e 's state as described above.

```
namespace std {
    template<class Engine, size_t p, size_t r>
    class discard_block_engine {
        public:
            // types
            using result_type = typename Engine::result_type;

            // engine characteristics
            static constexpr size_t block_size = p;
            static constexpr size_t used_block = r;
            static constexpr result_type min() { return Engine::min(); }
            static constexpr result_type max() { return Engine::max(); }

            // constructors and seeding functions
            discard_block_engine();
            explicit discard_block_engine(const Engine& e);
            explicit discard_block_engine(Engine&& e);
            explicit discard_block_engine(result_type s);
            template<class Sseq> explicit discard_block_engine(Sseq& q);
            void seed();
            void seed(result_type s);
            template<class Sseq> void seed(Sseq& q);

            // equality operators
            friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);
    };
}
```

```

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const discard_block_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, discard_block_engine& x);

private:
    Engine e;      // exposition only
    size_t n;       // exposition only
};

}

```

- ⁴ The following relations shall hold: $0 < r$ and $r \leq p$.
- ⁵ The textual representation consists of the textual representation of e followed by the value of n .
- ⁶ In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor sets n to 0.

28.5.5.3 Class template independent_bits_engine

[rand.adapt.ibits]

- ¹ An `independent_bits_engine` random number engine adaptor combines random numbers that are produced by some base engine e , so as to produce random numbers with a specified number of bits w . The state \mathbf{x}_i of an `independent_bits_engine` engine adaptor object x consists of the state e_i of its base engine e ; the size of the state is the size of e 's state.
- ² The transition and generation algorithms are described in terms of the following integral constants:
 - (2.1) — Let $R = e.\max() - e.\min() + 1$ and $m = \lfloor \log_2 R \rfloor$.
 - (2.2) — With n as determined below, let $w_0 = \lfloor w/n \rfloor$, $n_0 = n - w \bmod n$, $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$, and $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$.
 - (2.3) — Let $n = \lceil w/m \rceil$ if and only if the relation $R - y_0 \leq \lfloor y_0/n \rfloor$ holds as a result. Otherwise let $n = 1 + \lceil w/m \rceil$.

[Note 1: The relation $w = n_0 w_0 + (n - n_0)(w_0 + 1)$ always holds. — end note]
- ³ The transition algorithm is carried out by invoking $e()$ as often as needed to obtain n_0 values less than $y_0 + e.\min()$ and $n - n_0$ values less than $y_1 + e.\min()$.
- ⁴ The generation algorithm uses the values produced while advancing the state as described above to yield a quantity S obtained as if by the following algorithm:

```

S = 0;
for (k = 0; k != n_0; k += 1) {
    do u = e() - e.\min(); while (u \geq y_0);
    S = 2^{w_0} \cdot S + u \bmod 2^{w_0};
}
for (k = n_0; k != n; k += 1) {
    do u = e() - e.\min(); while (u \geq y_1);
    S = 2^{w_0+1} \cdot S + u \bmod 2^{w_0+1};
}

template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type min() { return 0; }

```

```

static constexpr result_type max() { return  $2^w - 1$ ; }

// constructors and seeding functions
independent_bits_engine();
explicit independent_bits_engine(const Engine& e);
explicit independent_bits_engine(Engine&& e);
explicit independent_bits_engine(result_type s);
template<class Sseq> explicit independent_bits_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);

private:
    Engine e; // exposition only
};

```

5 The following relations shall hold: $0 < w$ and $w \leq \text{numeric_limits<} \text{result_type}\text{>}::\text{digits}$.

6 The textual representation consists of the textual representation of `e`.

28.5.5.4 Class template `shuffle_order_engine`

[rand.adapt.shuf]

¹ A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine `e`, but delivers them in a different sequence. The state x_i of a `shuffle_order_engine` engine adaptor object `x` consists of the state `ei` of its base engine `e`, an additional value Y of the type delivered by `e`, and an additional sequence V of k values also of the type delivered by `e`. The size of the state is the size of `e`'s state plus $k + 1$.

² The transition algorithm permutes the values produced by `e`. The state transition is performed as follows:

- (2.1) — Calculate an integer $j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor$.
- (2.2) — Set Y to V_j and then set V_j to `e()`.

³ The generation algorithm yields the last value of Y produced while advancing `e`'s state as described above.

```

namespace std {
    template<class Engine, size_t k>
    class shuffle_order_engine {
        public:
            // types
            using result_type = typename Engine::result_type;

            // engine characteristics
            static constexpr size_t table_size = k;
            static constexpr result_type min() { return Engine::min(); }
            static constexpr result_type max() { return Engine::max(); }
    };
}

```

```

// constructors and seeding functions
shuffle_order_engine();
explicit shuffle_order_engine(const Engine& e);
explicit shuffle_order_engine(Engine&& e);
explicit shuffle_order_engine(result_type s);
template<class Sseq> explicit shuffle_order_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, shuffle_order_engine& x);

private:
    Engine e;           // exposition only
    result_type V[k];  // exposition only
    result_type Y;     // exposition only
};

}

```

⁴ The following relation shall hold: $0 < k$.

⁵ The textual representation consists of the textual representation of e , followed by the k values of V , followed by the value of Y .

⁶ In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor initializes $V[0], \dots, V[k-1]$ and Y , in that order, with values returned by successive invocations of $e()$.

28.5.6 Engines and engine adaptors with predefined parameters [rand.predef]

```
using minstd_rand0 =
    linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;
```

¹ *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `minstd_rand0` produces the value 1043618065.

```
using minstd_rand =
    linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;
```

² *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `minstd_rand` produces the value 399268537.

```
using mt19937 =
    mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
    0x9908'b0df, 11, 0xffff'ffff, 7, 0x9d2c'5680, 15, 0xfc6'0000, 18, 1'812'433'253>;
```

³ *Required behavior:* The 10000th consecutive invocation of a default-constructed object of type `mt19937` produces the value 4123659995.

```

using mt19937_64 =
    mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
    0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,
    0x71d6'7fff'eda6'0000, 37, 0xffff7'eee0'0000'0000, 43, 6'364'136'223'846'793'005>;
4   Required behavior: The 10000th consecutive invocation of a default-constructed object of type mt19937_64 produces the value 9981545732273789042.

using ranlux24_base =
    subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;
5   Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux24_base produces the value 7937952.

using ranlux48_base =
    subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;
6   Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux48_base produces the value 61839128582725.

using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;
7   Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux24 produces the value 9901578.

using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
8   Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux48 produces the value 249142670248501.

using knuth_b = shuffle_order_engine<minstd_rand0,256>;
9   Required behavior: The 10000th consecutive invocation of a default-constructed object of type knuth_b produces the value 1112339016.

using default_random_engine = implementation-defined;
10  Remarks: The choice of engine type named by this typedef is implementation-defined.

[Note 1: The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this typedef need not generate identical sequences across implementations. —end note]
```

28.5.7 Class `random_device`

[**rand.device**]

- 1 A `random_device` uniform random bit generator produces nondeterministic random numbers.
- 2 If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```

namespace std {
    class random_device {
        public:
            // types
            using result_type = unsigned int;

            // generator characteristics
            static constexpr result_type min() { return numeric_limits<result_type>::min(); }
            static constexpr result_type max() { return numeric_limits<result_type>::max(); }

            // constructors
            random_device() : random_device(implementation-defined) {}
            explicit random_device(const string& token);

            // generating functions
            result_type operator()();

            // property functions
            double entropy() const noexcept;
```

```

    // no copy functions
    random_device(const random_device&) = delete;
    void operator=(const random_device&) = delete;
};

}

explicit random_device(const string& token);

3   Throws: A value of an implementation-defined type derived from exception if the random_device cannot be initialized.

4   Remarks: The semantics of the token parameter and the token value used by the default constructor are implementation-defined.227

double entropy() const noexcept;

5   Returns: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate228 for the random numbers returned by operator(), in the range min() to  $\log_2(\max() + 1)$ .

result_type operator()();

6   Returns: A nondeterministic random value, uniformly distributed between min() and max() (inclusive). It is implementation-defined how these values are generated.

7   Throws: A value of an implementation-defined type derived from exception if a random number cannot be obtained.

```

28.5.8 Utilities

[rand.util]

28.5.8.1 Class `seed_seq`

[rand.util.seedseq]

```

namespace std {
    class seed_seq {
        public:
            // types
            using result_type = uint_least32_t;

            // constructors
            seed_seq() noexcept;
            template<class T>
            seed_seq(initializer_list<T> il);
            template<class InputIterator>
            seed_seq(InputIterator begin, InputIterator end);

            // generating functions
            template<class RandomAccessIterator>
            void generate(RandomAccessIterator begin, RandomAccessIterator end);

            // property functions
            size_t size() const noexcept;
            template<class OutputIterator>
            void param(OutputIterator dest) const;

            // no copy functions
            seed_seq(const seed_seq&) = delete;
            void operator=(const seed_seq&) = delete;

        private:
            vector<result_type> v;           // exposition only
    };
}

```

²²⁷) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

²²⁸) If a device has n states whose respective probabilities are P_0, \dots, P_{n-1} , the device entropy S is defined as

$$S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i.$$

```

seed_seq() noexcept;
1   Postconditions: v.empty() is true.

template<class T>
seed_seq(initializer_list<T> il);
2   Constraints: T is an integer type.
3   Effects: Same as seed_seq(il.begin(), il.end()).

template<class InputIterator>
seed_seq(InputIterator begin, InputIterator end);
4   Mandates: iterator_traits<InputIterator>::value_type is an integer type.
5   Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3).
6   Effects: Initializes v by the following algorithm:
    for (InputIterator s = begin; s != end; ++s)
        v.push_back((*s) mod 232);

template<class RandomAccessIterator>
void generate(RandomAccessIterator begin, RandomAccessIterator end);
7   Mandates: iterator_traits<RandomAccessIterator>::value_type is an unsigned integer type capable of accommodating 32-bit quantities.
8   Preconditions: RandomAccessIterator meets the Cpp17RandomAccessIterator requirements (25.3.5.7) and the requirements of a mutable iterator.
9   Effects: Does nothing if begin == end. Otherwise, with s = v.size() and n = end - begin, fills the supplied range [begin, end) according to the following algorithm in which each operation is to be carried out modulo 232, each indexing operator applied to begin is to be taken modulo n, and T(x) is defined as x xor (x rshift 27):
(9.1) — By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let p = (n - t)/2 and let q = p + t, where
      
$$t = (n \geq 623) ? 11 : (n \geq 68) ? 7 : (n \geq 39) ? 5 : (n \geq 7) ? 3 : (n - 1)/2;$$

(9.2) — With m as the larger of s + 1 and n, transform the elements of the range: iteratively for k = 0, ..., m - 1, calculate values
      
$$\begin{aligned} r_1 &= 1664525 \cdot T(\text{begin}[k] \text{ xor } \text{begin}[k + p] \text{ xor } \text{begin}[k - 1]) \\ r_2 &= r_1 + \begin{cases} s & , k = 0 \\ k \text{ mod } n + v[k - 1] & , 0 < k \leq s \\ k \text{ mod } n & , s < k \end{cases} \end{aligned}$$

      and, in order, increment begin[k + p] by  $r_1$ , increment begin[k + q] by  $r_2$ , and set begin[k] to  $r_2$ .
(9.3) — Transform the elements of the range again, beginning where the previous step ended: iteratively for k = m, ..., m + n - 1, calculate values
      
$$\begin{aligned} r_3 &= 1566083941 \cdot T(\text{begin}[k] + \text{begin}[k + p] + \text{begin}[k - 1]) \\ r_4 &= r_3 - (k \text{ mod } n) \end{aligned}$$

      and, in order, update begin[k + p] by xoring it with  $r_3$ , update begin[k + q] by xoring it with  $r_4$ , and set begin[k] to  $r_4$ .
10  Throws: What and when RandomAccessIterator operations of begin and end throw.

size_t size() const noexcept;
11 Returns: The number of 32-bit units that would be returned by a call to param().
12 Complexity: Constant time.

```

```

template<class OutputIterator>
void param(OutputIterator dest) const;
13   Mandates: Values of type result_type are writable (25.3.1) to dest.
14   Preconditions: OutputIterator meets the Cpp17OutputIterator requirements (25.3.5.4).
15   Effects: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the
     following statement:
     copy(v.begin(), v.end(), dest);
16   Throws: What and when OutputIterator operations of dest throw.

```

28.5.8.2 Function template `generate_canonical`

[rand.util.canonical]

```

template<class RealType, size_t bits, class URBG>
RealType generate_canonical(URBG& g);

```

1 *Effects:* Invokes `g()` k times to obtain values g_0, \dots, g_{k-1} , respectively. Calculates a quantity

$$S = \sum_{i=0}^{k-1} (g_i - g.\min()) \cdot R^i$$

using arithmetic of type `RealType`.

2 *Returns:* S/R^k .

[*Note 1:* $0 \leq S/R^k < 1$. — *end note*]

3 *Throws:* What and when `g` throws.

4 *Complexity:* Exactly $k = \max(1, \lceil b/\log_2 R \rceil)$ invocations of `g`, where b ²²⁹ is the lesser of `numeric_-limits<RealType>::digits` and `bits`, and R is the value of `g.max() - g.min() + 1`.

5 [Note 2: If the values g_i produced by `g` are uniformly distributed, the instantiation's results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — *end note*]

28.5.9 Random number distribution class templates

[rand.dist]

28.5.9.1 In general

[rand.dist.general]

- 1 Each type instantiated from a class template specified in this subclause 28.5.9 meets the requirements of a random number distribution (28.5.3.6) type.
- 2 Descriptions are provided in this subclause 28.5.9 only for distribution operations that are not described in 28.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
- 3 The algorithms for producing each of the specified distributions are implementation-defined.
- 4 The value of each probability density function $p(z)$ and of each discrete probability function $P(z_i)$ specified in this subclause is 0 everywhere outside its stated domain.

28.5.9.2 Uniform distributions

[rand.dist.uni]

28.5.9.2.1 Class template `uniform_int_distribution`

[rand.dist.uni.int]

- 1 A `uniform_int_distribution` random number distribution produces random integers i , $a \leq i \leq b$, distributed according to the constant discrete probability function

$$P(i | a, b) = 1/(b - a + 1).$$

```

namespace std {
    template<class IntType = int>
    class uniform_int_distribution {
        public:
            // types
            using result_type = IntType;
            using param_type = unspecified;
}

```

²²⁹ b is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`.

```

// constructors and reset functions
uniform_int_distribution() : uniform_int_distribution(0) {}
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
explicit uniform_int_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

// generating functions
template<class URNG>
result_type operator()(URNG& g);
template<class URNG>
result_type operator()(URNG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const uniform_int_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, uniform_int_distribution& x);
};

}

explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());

```

2 *Preconditions:* $a \leq b$.

3 *Remarks:* a and b correspond to the respective parameters of the distribution.

result_type a() const;

4 *Returns:* The value of the a parameter with which the object was constructed.

result_type b() const;

5 *Returns:* The value of the b parameter with which the object was constructed.

28.5.9.2.2 Class template uniform_real_distribution

[rand.dist.uni.real]

1 A `uniform_real_distribution` random number distribution produces random numbers x , $a \leq x < b$, distributed according to the constant probability density function

$$p(x | a, b) = 1/(b - a) .$$

[*Note 1:* This implies that $p(x | a, b)$ is undefined when $a == b$. — *end note*]

```

namespace std {
    template<class RealType = double>
    class uniform_real_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    uniform_real_distribution() : uniform_real_distribution(0.0) {}
    explicit uniform_real_distribution(RealType a, RealType b = 1.0);
    explicit uniform_real_distribution(const param_type& parm);
}

```

```

    void reset();

    // equality operators
    friend bool operator==(const uniform_real_distribution& x,
                           const uniform_real_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, uniform_real_distribution & x);
};

};

explicit uniform_real_distribution(RealType a, RealType b = 1.0);

```

2 *Preconditions:* $a \leq b$ and $b - a \leq \text{numeric_limits}<\text{RealType}>::\text{max}()$.

3 *Remarks:* a and b correspond to the respective parameters of the distribution.

result_type a() const;

4 *Returns:* The value of the a parameter with which the object was constructed.

result_type b() const;

5 *Returns:* The value of the b parameter with which the object was constructed.

28.5.9.3 Bernoulli distributions

[rand.dist.bern]

28.5.9.3.1 Class bernoulli_distribution

[rand.dist.bern.bernoulli]

1 A `bernoulli_distribution` random number distribution produces `bool` values b distributed according to the discrete probability function

$$P(b|p) = \begin{cases} p & \text{if } b = \text{true}, \text{ or} \\ 1 - p & \text{if } b = \text{false}. \end{cases}$$

```

namespace std {
    class bernoulli_distribution {
    public:
        // types
        using result_type = bool;
        using param_type = unspecified;

        // constructors and reset functions
        bernoulli_distribution() : bernoulli_distribution(0.5) {}
        explicit bernoulli_distribution(double p);
        explicit bernoulli_distribution(const param_type& parm);
        void reset();
    };
}

```

```

// equality operators
friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);
};

};

explicit bernoulli_distribution(double p);

```

2 *Preconditions:* $0 \leq p \leq 1$.

3 *Remarks:* p corresponds to the parameter of the distribution.

double p() const;

4 *Returns:* The value of the p parameter with which the object was constructed.

28.5.9.3.2 Class template binomial_distribution [rand.dist.bern.bin]

1 A `binomial_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i|t,p) = \binom{t}{i} \cdot p^i \cdot (1-p)^{t-i}.$$

```

namespace std {
    template<class IntType = int>
    class binomial_distribution {
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    binomial_distribution() : binomial_distribution(1) {}
    explicit binomial_distribution(IntType t, double p = 0.5);
    explicit binomial_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const binomial_distribution& x, const binomial_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);
}

```

```

// property functions
IntType t() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);
};

}

explicit binomial_distribution(IntType t, double p = 0.5);

```

2 *Preconditions:* $0 \leq p \leq 1$ and $0 \leq t$.

3 *Remarks:* t and p correspond to the respective parameters of the distribution.

IntType t() const;

4 *Returns:* The value of the t parameter with which the object was constructed.

double p() const;

5 *Returns:* The value of the p parameter with which the object was constructed.

28.5.9.3.3 Class template geometric_distribution

[rand.dist.bern.geo]

1 A *geometric_distribution* random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i | p) = p \cdot (1 - p)^i .$$

```

namespace std {
    template<class IntType = int>
    class geometric_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;

        // constructors and reset functions
        geometric_distribution() : geometric_distribution(0.5) {}
        explicit geometric_distribution(double p);
        explicit geometric_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

        // generating functions
        template<class URNG>
        result_type operator()(URNG& g);
        template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

        // property functions
        double p() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
    };
}
```

```

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const geometric_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, geometric_distribution& x);
};

}

explicit geometric_distribution(double p);

```

2 *Preconditions:* $0 < p < 1$.

3 *Remarks:* p corresponds to the parameter of the distribution.

double p() const;

4 *Returns:* The value of the p parameter with which the object was constructed.

28.5.9.3.4 Class template negative_binomial_distribution [rand.dist.bern.negbin]

1 A `negative_binomial_distribution` random number distribution produces random integers $i \geq 0$ distributed according to the discrete probability function

$$P(i | k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i .$$

[Note 1: This implies that $P(i | k, p)$ is undefined when $p == 1$. — end note]

```

namespace std {
    template<class IntType = int>
    class negative_binomial_distribution {
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructor and reset functions
    negative_binomial_distribution() : negative_binomial_distribution(1) {}
    explicit negative_binomial_distribution(IntType k, double p = 0.5);
    explicit negative_binomial_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const negative_binomial_distribution& x,
                           const negative_binomial_distribution& y);

    // generating functions
    template<class URNG>
    result_type operator()(URNG& g);
    template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

    // property functions
    IntType k() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const negative_binomial_distribution& x);

```

```

    template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, negative_binomial_distribution& x);
    };
}

explicit negative_binomial_distribution(IntType k, double p = 0.5);

```

2 *Preconditions:* $0 < p \leq 1$ and $0 < k$.

3 *Remarks:* k and p correspond to the respective parameters of the distribution.

`IntType k() const;`

4 *Returns:* The value of the k parameter with which the object was constructed.

`double p() const;`

5 *Returns:* The value of the p parameter with which the object was constructed.

28.5.9.4 Poisson distributions

[rand.dist.pois]

28.5.9.4.1 Class template poisson_distribution

[rand.dist.pois.poisson]

1 A `poisson_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i | \mu) = \frac{e^{-\mu} \mu^i}{i!}.$$

The distribution parameter μ is also known as this distribution's *mean*.

```

template<class IntType = int>
class poisson_distribution
{
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {}
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const poisson_distribution& x, const poisson_distribution& y);

    // generating functions
    template<class URNG>
    result_type operator()(URNG& g);
    template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const poisson_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, poisson_distribution& x);
};

```

```
explicit poisson_distribution(double mean);
```

2 *Preconditions:* $0 < \text{mean}$.

3 *Remarks:* `mean` corresponds to the parameter of the distribution.

```
double mean() const;
```

4 *Returns:* The value of the `mean` parameter with which the object was constructed.

28.5.9.4.2 Class template `exponential_distribution`

[`rand.dist.pois.exp`]

1 An `exponential_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x | \lambda) = \lambda e^{-\lambda x} .$$

```
namespace std {
    template<class RealType = double>
    class exponential_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructors and reset functions
            exponential_distribution() : exponential_distribution(1.0) {}
            explicit exponential_distribution(RealType lambda);
            explicit exponential_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const exponential_distribution& x, const exponential_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            RealType lambda() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const exponential_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, exponential_distribution& x);
    };
}

explicit exponential_distribution(RealType lambda);

2   Preconditions:  $0 < \lambda$ .
3   Remarks: lambda corresponds to the parameter of the distribution.

RealType lambda() const;

4   Returns: The value of the lambda parameter with which the object was constructed.
```

28.5.9.4.3 Class template `gamma_distribution`[`rand.dist.pois.gamma`]

- ¹ A `gamma_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.$$

```
namespace std {
    template<class RealType = double>
    class gamma_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructors and reset functions
            gamma_distribution() : gamma_distribution(1.0) {}
            explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
            explicit gamma_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const gamma_distribution& x, const gamma_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            RealType alpha() const;
            RealType beta() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const gamma_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, gamma_distribution& x);
    };
}

explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
```

- ² *Preconditions:* $0 < \alpha$ and $0 < \beta$.

- ³ *Remarks:* α and β correspond to the parameters of the distribution.

`RealType alpha() const;`

- ⁴ *Returns:* The value of the `alpha` parameter with which the object was constructed.

`RealType beta() const;`

- ⁵ *Returns:* The value of the `beta` parameter with which the object was constructed.

28.5.9.4.4 Class template `weibull_distribution`[`rand.dist.pois.weibull`]

- ¹ A `weibull_distribution` random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function

$$p(x | a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right).$$

```
namespace std {
    template<class RealType = double>
    class weibull_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            weibull_distribution() : weibull_distribution(1.0) {}
            explicit weibull_distribution(RealType a, RealType b = 1.0);
            explicit weibull_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            RealType a() const;
            RealType b() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const weibull_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
    };
}

explicit weibull_distribution(RealType a, RealType b = 1.0);
```

- ² *Preconditions:* $0 < a$ and $0 < b$.

- ³ *Remarks:* a and b correspond to the respective parameters of the distribution.

`RealType a() const;`

- ⁴ *Returns:* The value of the a parameter with which the object was constructed.

`RealType b() const;`

- ⁵ *Returns:* The value of the b parameter with which the object was constructed.

28.5.9.4.5 Class template `extreme_value_distribution` [rand.dist.pois.extreme]

- ¹ An `extreme_value_distribution` random number distribution produces random numbers x distributed according to the probability density function²³⁰

$$p(x | a, b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right).$$

```
namespace std {
    template<class RealType = double>
    class extreme_value_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        extreme_value_distribution() : extreme_value_distribution(0.0) {}
        explicit extreme_value_distribution(RealType a, RealType b = 1.0);
        explicit extreme_value_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const extreme_value_distribution& x,
                               const extreme_value_distribution& y);

        // generating functions
        template<class URNG>
        result_type operator()(URNG& g);
        template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

        // property functions
        RealType a() const;
        RealType b() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
    };
}

explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

² *Preconditions:* $0 < b$.

³ *Remarks:* `a` and `b` correspond to the respective parameters of the distribution.

`RealType a() const;`

⁴ *Returns:* The value of the `a` parameter with which the object was constructed.

`RealType b() const;`

⁵ *Returns:* The value of the `b` parameter with which the object was constructed.

²³⁰) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

28.5.9.5 Normal distributions

[rand.dist.norm]

28.5.9.5.1 Class template `normal_distribution`

[rand.dist.norm.normal]

- ¹ A `normal_distribution` random number distribution produces random numbers x distributed according to the probability density function

$$p(x | \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right).$$

The distribution parameters μ and σ are also known as this distribution's *mean* and *standard deviation*.

```
namespace std {
    template<class RealType = double>
    class normal_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    normal_distribution() : normal_distribution(0.0) {}
    explicit normal_distribution(RealType mean, RealType stddev = 1.0);
    explicit normal_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const normal_distribution& x, const normal_distribution& y);

    // generating functions
    template<class URNG>
        result_type operator()(URNG& g);
    template<class URNG>
        result_type operator()(URNG& g, const param_type& parm);

    // property functions
    RealType mean() const;
    RealType stddev() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
        friend basic_ostream<charT, traits>&
            operator<<((basic_ostream<charT, traits>& os, const normal_distribution& x));
    template<class charT, class traits>
        friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
    };

};

explicit normal_distribution(RealType mean, RealType stddev = 1.0);
```

- ² *Preconditions:* $0 < \text{stddev}$.

- ³ *Remarks:* `mean` and `stddev` correspond to the respective parameters of the distribution.

- `RealType mean() const;`

- ⁴ *Returns:* The value of the `mean` parameter with which the object was constructed.

`RealType stddev() const;`

- ⁵ *Returns:* The value of the `stddev` parameter with which the object was constructed.

28.5.9.5.2 Class template `lognormal_distribution` [rand.dist.norm.lognormal]

- ¹ A `lognormal_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x | m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right).$$

```
namespace std {
    template<class RealType = double>
    class lognormal_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            lognormal_distribution() : lognormal_distribution(0.0) {}
            explicit lognormal_distribution(RealType m, RealType s = 1.0);
            explicit lognormal_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            RealType m() const;
            RealType s() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
    };
}

explicit lognormal_distribution(RealType m, RealType s = 1.0);
```

² *Preconditions:* $0 < s$.

³ *Remarks:* m and s correspond to the respective parameters of the distribution.

`RealType m() const;`

⁴ *Returns:* The value of the m parameter with which the object was constructed.

`RealType s() const;`

⁵ *Returns:* The value of the s parameter with which the object was constructed.

28.5.9.5.3 Class template `chi_squared_distribution` [rand.dist.norm.chisq]

- ¹ A `chi_squared_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x | n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}} .$$

```
namespace std {
    template<class RealType = double>
    class chi_squared_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            chi_squared_distribution() : chi_squared_distribution(1.0) {}
            explicit chi_squared_distribution(RealType n);
            explicit chi_squared_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const chi_squared_distribution& x, const chi_squared_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            RealType n() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const chi_squared_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, chi_squared_distribution& x);
    };
}

explicit chi_squared_distribution(RealType n);
```

² *Preconditions:* $0 < n$.

³ *Remarks:* n corresponds to the parameter of the distribution.

`RealType n() const;`

⁴ *Returns:* The value of the n parameter with which the object was constructed.

28.5.9.5.4 Class template `cauchy_distribution` [rand.dist.norm.cauchy]

- ¹ A `cauchy_distribution` random number distribution produces random numbers x distributed according to the probability density function

$$p(x | a, b) = \left(\pi b \left(1 + \left(\frac{x-a}{b} \right)^2 \right) \right)^{-1} .$$

```

namespace std {
    template<class RealType = double>
    class cauchy_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            cauchy_distribution() : cauchy_distribution(0.0) {}
            explicit cauchy_distribution(RealType a, RealType b = 1.0);
            explicit cauchy_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            RealType a() const;
            RealType b() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const cauchy_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
        };
    }
}

explicit cauchy_distribution(RealType a, RealType b = 1.0);

```

2 *Preconditions:* $0 < b$.

3 *Remarks:* a and b correspond to the respective parameters of the distribution.

RealType a() const;

4 *Returns:* The value of the a parameter with which the object was constructed.

RealType b() const;

5 *Returns:* The value of the b parameter with which the object was constructed.

28.5.9.5.5 Class template fisher_f_distribution

[rand.dist.norm.f]

1 A *fisher_f_distribution* random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function

$$p(x | m, n) = \frac{\Gamma((m+n)/2)}{\Gamma(m/2) \Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}.$$

```

namespace std {
    template<class RealType = double>
    class fisher_f_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            fisher_f_distribution() : fisher_f_distribution(1.0) {}
            explicit fisher_f_distribution(RealType m, RealType n = 1.0);
            explicit fisher_f_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const fisher_f_distribution& x, const fisher_f_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            RealType m() const;
            RealType n() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const fisher_f_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
    };
}

explicit fisher_f_distribution(RealType m, RealType n = 1);

```

2 *Preconditions:* $0 < m$ and $0 < n$.

3 *Remarks:* m and n correspond to the respective parameters of the distribution.

RealType m() const;

4 *Returns:* The value of the m parameter with which the object was constructed.

RealType n() const;

5 *Returns:* The value of the n parameter with which the object was constructed.

28.5.9.5.6 Class template student_t_distribution

[rand.dist.norm.t]

1 A `student_t_distribution` random number distribution produces random numbers x distributed according to the probability density function

$$p(x | n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}.$$

```

namespace std {
    template<class RealType = double>
    class student_t_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            student_t_distribution() : student_t_distribution(1.0) {}
            explicit student_t_distribution(RealType n);
            explicit student_t_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            RealType n() const;

            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
        };
    };

    explicit student_t_distribution(RealType n);
}

```

2 *Preconditions:* $0 < n$.

3 *Remarks:* n corresponds to the parameter of the distribution.

RealType n() const;

4 *Returns:* The value of the n parameter with which the object was constructed.

28.5.9.6 Sampling distributions

[rand.dist.samp]

28.5.9.6.1 Class template discrete_distribution

[rand.dist.samp.discrete]

1 A *discrete_distribution* random number distribution produces random integers i , $0 \leq i < n$, distributed according to the discrete probability function

$$P(i | p_0, \dots, p_{n-1}) = p_i .$$

2 Unless specified otherwise, the distribution parameters are calculated as: $p_k = w_k / S$ for $k = 0, \dots, n - 1$, in which the values w_k , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \dots + w_{n-1}$.

```

namespace std {
    template<class IntType = int>
    class discrete_distribution {
        public:
            // types
            using result_type = IntType;
            using param_type = unspecified;

            // constructor and reset functions
            discrete_distribution();
            template<class InputIterator>
                discrete_distribution(InputIterator firstW, InputIterator lastW);
            discrete_distribution(initializer_list<double> wl);
            template<class UnaryOperation>
                discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
            explicit discrete_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

            // generating functions
            template<class URNG>
                result_type operator()(URNG& g);
            template<class URNG>
                result_type operator()(URNG& g, const param_type& parm);

            // property functions
            vector<double> probabilities() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
                friend basic_ostream<charT, traits>&
                    operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
            template<class charT, class traits>
                friend basic_istream<charT, traits>&
                    operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);
    };
}
discrete_distribution();

```

3 *Effects:* Constructs a `discrete_distribution` object with $n = 1$ and $p_0 = 1$.

[*Note 1:* Such an object will always deliver the value 0. — *end note*]

```

template<class InputIterator>
    discrete_distribution(InputIterator firstW, InputIterator lastW);
4     Mandates: is_convertible_v<iterator_traits<InputIterator>::value_type, double> is true.
5     Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3). If firstW == lastW, let  $n = 1$  and  $w_0 = 1$ . Otherwise,  $[firstW, lastW)$  forms a sequence  $w$  of length  $n > 0$ .
6     Effects: Constructs a discrete_distribution object with probabilities given by the formula above.

```

```

    discrete_distribution(initializer_list<double> wl);
7     Effects: Same as discrete_distribution(wl.begin(), wl.end()).

```

```

template<class UnaryOperation>
    discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
8     Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

```

- 9 *Preconditions:* If `nw` = 0, let n = 1, otherwise let n = `nw`. The relation $0 < \delta = (\text{xmax} - \text{xmin})/n$ holds.
- 10 *Effects:* Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If `nw` = 0, let w_0 = 1. Otherwise, let $w_k = \text{fw}(\text{xmin} + k \cdot \delta + \delta/2)$ for $k = 0, \dots, n - 1$.
- 11 *Complexity:* The number of invocations of `fw` does not exceed n .

```
vector<double> probabilities() const;
```

- 12 *Returns:* A `vector<double>` whose `size` member returns n and whose `operator[]` member returns p_k when invoked with argument k for $k = 0, \dots, n - 1$.

28.5.9.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

- 1 A `piecewise_constant_distribution` random number distribution produces random numbers x , $b_0 \leq x < b_n$, uniformly distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1}.$$

- 2 The $n + 1$ distribution parameters b_i , also known as this distribution's *interval boundaries*, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \dots, n - 1$. Unless specified otherwise, the remaining n distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \dots, n - 1,$$

in which the values w_k , commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \dots + w_{n-1}$.

```
namespace std {
    template<class RealType = double>
    class piecewise_constant_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            piecewise_constant_distribution();
            template<class InputIteratorB, class InputIteratorW>
            piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                            InputIteratorW firstW);
            template<class UnaryOperation>
            piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
            template<class UnaryOperation>
            piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
                                            UnaryOperation fw);
            explicit piecewise_constant_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const piecewise_constant_distribution& x,
                                   const piecewise_constant_distribution& y);

            // generating functions
            template<class URNG>
            result_type operator()(URNG& g);
            template<class URNG>
            result_type operator()(URNG& g, const param_type& parm);

            // property functions
            vector<result_type> intervals() const;
            vector<result_type> densities() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;
    };
}
```

```

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const piecewise_constant_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, piecewise_constant_distribution& x);
};

piecewise_constant_distribution();

Effects: Constructs a piecewise_constant_distribution object with  $n = 1$ ,  $\rho_0 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .
```

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: If $\text{firstB} == \text{lastB}$ or $\text{firstB} == \text{lastB}$, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $[\text{firstB}, \text{lastB}]$ forms a sequence b of length $n + 1$, the length of the sequence w starting from firstW is at least n , and any w_k for $k \geq n$ are ignored by the distribution.

Mandates: Both of

(4.1) — `is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>`

(4.2) — `is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>`

are true.

Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements (25.3.5.3). If $\text{firstB} == \text{lastB}$ or $\text{firstB} == \text{lastB}$, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $[\text{firstB}, \text{lastB}]$ forms a sequence b of length $n + 1$, the length of the sequence w starting from firstW is at least n , and any w_k for $k \geq n$ are ignored by the distribution.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: If $\text{bl.size()} < 2$, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let $[\text{bl.begin()}, \text{bl.end}()]$ form a sequence b_0, \dots, b_n , and let $w_k = \text{fw}((b_{k+1} + b_k)/2)$ for $k = 0, \dots, n - 1$.

Complexity: The number of invocations of fw does not exceed n .

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: Let $b_k = \text{xmin} + k \cdot \delta$ for $k = 0, \dots, n$, and $w_k = \text{fw}(b_k + \delta/2)$ for $k = 0, \dots, n - 1$.

Complexity: The number of invocations of fw does not exceed n .

Returns: A vector<result_type> whose size member returns $n + 1$ and whose operator[] member returns b_k when invoked with argument k for $k = 0, \dots, n$.

Returns: A vector<result_type> whose size member returns n and whose operator[] member returns ρ_k when invoked with argument k for $k = 0, \dots, n - 1$.

28.5.9.6.3 Class template piecewise_linear_distribution [rand.dist.samp.plinear]

- 1 A piecewise_linear_distribution random number distribution produces random numbers x , $b_0 \leq x < b_n$, distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function

$$p(x | b_0, \dots, b_n, \rho_0, \dots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.$$

- ² The $n + 1$ distribution parameters b_i , also known as this distribution's *interval boundaries*, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \dots, n - 1$. Unless specified otherwise, the remaining $n + 1$ distribution parameters are calculated as $\rho_k = w_k/S$ for $k = 0, \dots, n$, in which the values w_k , commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k) .$$

```

namespace std {
    template<class RealType = double>
    class piecewise_linear_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    piecewise_linear_distribution();
    template<class InputIteratorB, class InputIteratorW>
    piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                InputIteratorW firstW);
    template<class UnaryOperation>
    piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
    piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
    explicit piecewise_linear_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const piecewise_linear_distribution& x,
                           const piecewise_linear_distribution& y);

    // generating functions
    template<class URNG>
    result_type operator()(URNG& g);
    template<class URNG>
    result_type operator()(URNG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const piecewise_linear_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
};

piecewise_linear_distribution();

```

- ³ *Effects:* Constructs a `piecewise_linear_distribution` object with $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$.

```

template<class InputIteratorB, class InputIteratorW>
piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                             InputIteratorW firstW);

4   Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

5   Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements
(25.3.5.3). If firstB == lastB or ++firstB == lastB, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ .
Otherwise,  $[firstB, lastB)$  forms a sequence  $b$  of length  $n + 1$ , the length of the sequence  $w$  starting
from firstW is at least  $n + 1$ , and any  $w_k$  for  $k \geq n + 1$  are ignored by the distribution.

6   Effects: Constructs a piecewise_linear_distribution object with parameters as specified above.

template<class UnaryOperation>
piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);

7   Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

8   Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated
from the following values: If bl.size() < 2, let  $n = 1$ ,  $\rho_0 = \rho_1 = 1$ ,  $b_0 = 0$ , and  $b_1 = 1$ . Otherwise, let
 $[bl.begin(), bl.end())$  form a sequence  $b_0, \dots, b_n$ , and let  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .

9   Complexity: The number of invocations of fw does not exceed  $n + 1$ .

template<class UnaryOperation>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

10  Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

11  Preconditions: If nw = 0, let  $n = 1$ , otherwise let  $n = nw$ . The relation  $0 < \delta = (xmax - xmin)/n$  holds.

12  Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated
from the following values: Let  $b_k = xmin + k \cdot \delta$  for  $k = 0, \dots, n$ , and  $w_k = fw(b_k)$  for  $k = 0, \dots, n$ .

13  Complexity: The number of invocations of fw does not exceed  $n + 1$ .

vector<result_type> intervals() const;

14  Returns: A vector<result_type> whose size member returns  $n + 1$  and whose operator[] member
returns  $b_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

vector<result_type> densities() const;

15  Returns: A vector<result_type> whose size member returns  $n$  and whose operator[] member
returns  $\rho_k$  when invoked with argument  $k$  for  $k = 0, \dots, n$ .

```

28.5.10 Low-quality random number generation

[c.math.rand]

¹ [Note 1: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — end note]

```

int rand();
void srand(unsigned int seed);

```

² *Effects:* The `rand` and `srand` functions have the semantics specified in the C standard library.

³ *Remarks:* The implementation may specify that particular library functions may call `rand`. It is
implementation-defined whether the `rand` function may introduce data races (16.4.6.10).

[Note 2: The other random number generation facilities in this document (28.5) are often preferable to `rand`,
because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with
unpredictable and oft-questionable quality and performance. — end note]

SEE ALSO: ISO/IEC 9899:2018, 7.22.2

28.6 Numeric arrays

[numarray]

28.6.1 Header `<valarray>` synopsis

[valarray.syn]

```

#include <initializer_list>      // see 17.10.2

namespace std {
    template<class T> class valarray;          // An array of type T
    class slice;                            // a BLAS-like slice out of an array
    template<class T> class slice_array;
}

```

```

template<class T> valarray<T> pow(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow(const typename valarray<T>::value_type&, const valarray<T>&);

template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);

template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
}

```

- ¹ The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.
- ² The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.
- ³ Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the `const` member functions of `valarray<T>` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.²³¹
- ⁴ Implementations introducing such replacement types shall provide additional functions and operators as follows:
 - (4.1) — for every function taking a `const valarray<T>&` other than `begin` and `end` (28.6.10), identical functions taking the replacement types shall be added;
 - (4.2) — for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.
- ⁵ In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.
- ⁶ These library functions are permitted to throw a `bad_alloc` (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

28.6.2 Class template `valarray`

[template.valarray]

28.6.2.1 Overview

[template.valarray.overview]

```

namespace std {
    template<class T> class valarray {
        public:
            using value_type = T;

            // 28.6.2.2, construct/destroy
            valarray();
            explicit valarray(size_t);
            valarray(const T&, size_t);
            valarray(const T*, size_t);
            valarray(const valarray&);
            valarray(valarray&&) noexcept;
            valarray(const slice_array<T>&);
            valarray(const gslice_array<T>&);
            valarray(const mask_array<T>&);
            valarray(const indirect_array<T>&);
            valarray(initializer_list<T>);
            ~valarray();
    };
}

```

²³¹⁾ Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for `valarray` expressions.

```

// 28.6.2.3, assignment
valarray& operator=(const valarray&);
valarray& operator=(valarray&&) noexcept;
valarray& operator=(initializer_list<T>);
valarray& operator=(const T&);
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

// 28.6.2.4, element access
const T& operator[](size_t) const;
T& operator[](size_t);

// 28.6.2.5, subset operations
valarray operator[](slice) const;
slice_array<T> operator[](slice);
valarray operator[](const gslice&) const;
gslice_array<T> operator[](const gslice&);
valarray operator[](const valarray<bool>&) const;
mask_array<T> operator[](const valarray<bool>&);
valarray operator[](const valarray<size_t>&) const;
indirect_array<T> operator[](const valarray<size_t>&);

// 28.6.2.6, unary operators
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

// 28.6.2.7, compound assignment
valarray& operator*=(const T&);
valarray& operator/=(const T&);
valarray& operator%=(const T&);
valarray& operator+==(const T&);
valarray& operator-=(const T&);
valarray& operator^=(const T&);
valarray& operator&=(const T&);
valarray& operator|==(const T&);
valarray& operator<==(const T&);
valarray& operator>==(const T&);

valarray& operator*=(const valarray&);
valarray& operator/=(const valarray&);
valarray& operator%=(const valarray&);
valarray& operator+==(const valarray&);
valarray& operator-=(const valarray&);
valarray& operator^=(const valarray&);
valarray& operator|==(const valarray&);
valarray& operator&=(const valarray&);
valarray& operator<==(const valarray&);
valarray& operator>==(const valarray&);

// 28.6.2.8, member functions
void swap(valarray&) noexcept;

size_t size() const;

T sum() const;
T min() const;
T max() const;

valarray shift (int) const;
valarray cshift(int) const;

```

```

    valarray apply(T func(T)) const;
    valarray apply(T func(const T&)) const;
    void resize(size_t sz, T c = T());
};

template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;
}

```

- ¹ The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 28.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.²³²

28.6.2.2 Constructors

[`valarray.cons`]

`valarray();`

- ¹ *Effects:* Constructs a `valarray` that has zero length.²³³

`explicit valarray(size_t n);`

- ² *Effects:* Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.4).

`valarray(const T& v, size_t n);`

- ³ *Effects:* Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

`valarray(const T* p, size_t n);`

- ⁴ *Preconditions:* `[p, p + n)` is a valid range.

- ⁵ *Effects:* Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.²³⁴

`valarray(const valarray& v);`

- ⁶ *Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.²³⁵

`valarray(valarray&& v) noexcept;`

- ⁷ *Effects:* Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

- ⁸ *Complexity:* Constant.

`valarray(initializer_list<T> il);`

- ⁹ *Effects:* Equivalent to `valarray(il.begin(), il.size())`.

`valarray(const slice_array<T>&);`

`valarray(const gslice_array<T>&);`

`valarray(const mask_array<T>&);`

`valarray(const indirect_array<T>&);`

- ¹⁰ These conversion constructors convert one of the four reference templates to a `valarray`.

`~valarray();`

- ¹¹ *Effects:* The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

²³²) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

²³³) This default constructor is essential, since arrays of `valarray` can be useful. After initialization, the length of an empty array can be increased with the `resize` member function.

²³⁴) This constructor is the preferred method for converting a C array to a `valarray` object.

²³⁵) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

28.6.2.3 Assignment

[valarray.assign]

```
valarray& operator=(const valarray& v);
```

1 *Effects:* Each element of the `*this` array is assigned the value of the corresponding element of `v`. If the length of `v` is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

2 *Postconditions:* `size() == v.size()`.

3 *Returns:* `*this`.

```
valarray& operator=(valarray&& v) noexcept;
```

4 *Effects:* `*this` obtains the value of `v`. The value of `v` after the assignment is not specified.

5 *Returns:* `*this`.

6 *Complexity:* Linear.

```
valarray& operator=(initializer_list<T> il);
```

7 *Effects:* Equivalent to: `return *this = valarray(il);`

```
valarray& operator=(const T& v);
```

8 *Effects:* Assigns `v` to each element of `*this`.

9 *Returns:* `*this`.

```
valarray& operator=(const slice_array<T>&);
```

```
valarray& operator=(const gslice_array<T>&);
```

```
valarray& operator=(const mask_array<T>&);
```

```
valarray& operator=(const indirect_array<T>&);
```

10 *Preconditions:* The length of the array to which the argument refers equals `size()`. The value of an element in the left-hand side of a `valarray` assignment operator does not depend on the value of another element in that left-hand side.

11 These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

28.6.2.4 Element access

[valarray.access]

```
const T& operator[](size_t n) const;
T& operator[](size_t n);
```

1 *Preconditions:* `n < size()` is true.

2 *Returns:* A reference to the corresponding element of the array.

[*Note 1:* The expression `(a[i] = q, a[i]) == q` evaluates to true for any non-constant `valarray<T> a`, any `T q`, and for any `size_t i` such that the value of `i` is less than the length of `a`. — end note]

3 *Remarks:* The expression `addressof(a[i+j]) == addressof(a[i]) + j` evaluates to true for all `size_t i` and `size_t j` such that `i+j < a.size()`.

4 The expression `addressof(a[i]) != addressof(b[j])` evaluates to true for any two arrays `a` and `b` and for any `size_t i` and `size_t j` such that `i < a.size()` and `j < b.size()`.

[*Note 2:* This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarrays`. — end note]

5 The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

28.6.2.5 Subset operations

[valarray.sub]

1 The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new `valarray` object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=`.

and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

```
valarray operator[](slice slicearr) const;
```

2 >Returns: A valarray containing those elements of the controlled sequence designated by `slicearr`.

[Example 1:

```
const valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
// v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
— end example]
```

```
slice_array<T> operator[](slice slicearr);
```

3 >Returns: An object that holds references to elements of the controlled sequence selected by `slicearr`.

[Example 2:

```
valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkDmnEp", 16)
— end example]
```

```
valarray operator[](const gslice& gslicearr) const;
```

4 >Returns: A valarray containing those elements of the controlled sequence designated by `gslicearr`.

[Example 3:

```
const valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
— end example]
```

```
gslice_array<T> operator[](const gslice& gslicearr);
```

5 >Returns: An object that holds references to elements of the controlled sequence selected by `gslicearr`.

[Example 4:

```
valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
valarray<char> v1("ABCDEF", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
— end example]
```

```
valarray operator[](const valarray<bool>& boolarr) const;
```

6 >Returns: A valarray containing those elements of the controlled sequence designated by `boolarr`.

[Example 5:

```
const valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
— end example]
```

```
mask_array<T> operator[](const valarray<bool>& boolarr);
```

7 >Returns: An object that holds references to elements of the controlled sequence selected by `boolarr`.

[Example 6:

```
valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
```

```

valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
— end example]

```

```
valarray operator[](const valarray<size_t>& indarr) const;
```

- 8 >Returns: A valarray containing those elements of the controlled sequence designated by `indarr`.

[Example 7:

```

const valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
— end example]

```

```
indirect_array<T> operator[](const valarray<size_t>& indarr);
```

- 9 >Returns: An object that holds references to elements of the controlled sequence selected by `indarr`.

[Example 8:

```

valarray<char> v0("abcdefghijklmnopqrstuvwxyz", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEijklmnop", 16)
— end example]

```

28.6.2.6 Unary operators

[**valarray.unary**]

```

valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

```

- 1 >Mandates: The indicated operator can be applied to operands of type T and returns a value of type T (bool for operator!) or which may be unambiguously implicitly converted to type T (bool for operator!).

- 2 >Returns: A valarray whose length is `size()`. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

28.6.2.7 Compound assignment

[**valarray.cassign**]

```

valarray& operator*=(const valarray& v);
valarray& operator/=(const valarray& v);
valarray& operator%=(const valarray& v);
valarray& operator+==(const valarray& v);
valarray& operator-==(const valarray& v);
valarray& operator^=(const valarray& v);
valarray& operator&=(const valarray& v);
valarray& operator|==(const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);

```

- 1 >Mandates: The indicated operator can be applied to two operands of type T.

- 2 >Preconditions: `size() == v.size()` is true.

The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.

- 3 >Effects: Each of these operators performs the indicated operation on each of the elements of `*this` and the corresponding element of v.

- 4 >Returns: `*this`.

5 *Remarks:* The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```
valarray& operator*=(const T& v);
valarray& operator/=(const T& v);
valarray& operator%=(const T& v);
valarray& operator+==(const T& v);
valarray& operator-==(const T& v);
valarray& operator^=(const T& v);
valarray& operator&=(const T& v);
valarray& operator|==(const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);
```

6 *Mandates:* The indicated operator can be applied to two operands of type T.

7 *Effects:* Each of these operators applies the indicated operation to each element of **this* and v.

8 *Returns:* **this*

9 *Remarks:* The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

28.6.2.8 Member functions

[**valarray.members**]

```
void swap(valarray& v) noexcept;
```

1 *Effects:* **this* obtains the value of v. v obtains the value of **this*.

2 *Complexity:* Constant.

```
size_t size() const;
```

3 *Returns:* The number of elements in the array.

4 *Complexity:* Constant time.

```
T sum() const;
```

5 *Mandates:* *operator+=* can be applied to operands of type T.

6 *Preconditions:* *size()* > 0 is true.

7 *Returns:* The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying *operator+=* to a copy of an element of the array and all other elements of the array in an unspecified order.

```
T min() const;
```

8 *Preconditions:* *size()* > 0 is true.

9 *Returns:* The minimum value contained in **this*. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using *operator<*.

```
T max() const;
```

10 *Preconditions:* *size()* > 0 is true.

11 *Returns:* The maximum value contained in **this*. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using *operator<*.

```
valarray shift(int n) const;
```

12 *Returns:* A valarray of length *size()*, each of whose elements *I* is (**this*)*[I + n]* if *I + n* is non-negative and less than *size()*, otherwise *T()*.

[*Note 1:* If element zero is taken as the leftmost element, a positive value of n shifts the elements left n places, with zero fill. — end note]

13 [*Example 1:* If the argument has the value -2, the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of **this*; etc. — end example]

```

valarray cshift(int n) const;
14   Returns: A valarray of length size() that is a circular shift of *this. If element zero is taken as the
      leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative
      value of n shifts the elements circularly right -n places.

valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;
15   Returns: A valarray whose length is size(). Each element of the returned array is assigned the value
      returned by applying the argument function to the corresponding element of *this.

void resize(size_t sz, T c = T());
16   Effects: Changes the length of the *this array to sz and then assigns to each element the value of the
      second argument. Resizing invalidates all pointers and references to elements in the array.

```

28.6.3 valarray non-member operations

[valarray.nonmembers]

28.6.3.1 Binary operators

[valarray.binary]

```

template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);

```

- 1 *Mandates:* The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.
- 2 *Preconditions:* The argument arrays have the same length.
- 3 *Returns:* A valarray whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```

template<class T> valarray<T> operator* (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator* (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&,
                                         const typename valarray<T>::value_type&);

```

```

template<class T> valarray<T> operator& (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&,
                                            const valarray<T>&);

```

- 4 *Mandates*: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.
- 5 *Returns*: A valarray whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

28.6.3.2 Logical operators

[valarray.comparison]

```

template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<= (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>= (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator|| (const valarray<T>&, const valarray<T>&);

```

- 1 *Mandates*: The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.
- 2 *Preconditions*: The two array arguments have the same length.
- 3 *Returns*: A valarray<bool> whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```

template<class T> valarray<bool> operator==(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator< (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator> (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator<= (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<= (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator>= (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>= (const typename valarray<T>::value_type&,
                                            const valarray<T>&);

```

```
template<class T> valarray<bool> operator&&(const valarray<T>&,
                                              const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&,
                                              const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&,
                                              const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator||(const typename valarray<T>::value_type&,
                                              const valarray<T>&);
```

- 4 *Mandates*: The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.
- 5 *Returns*: A valarray<bool> whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

28.6.3.3 Transcendentals

[valarray.transcend]

```
template<class T> valarray<T> abs (const valarray<T>&);
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp (const valarray<T>&);
template<class T> valarray<T> log (const valarray<T>&);
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> sin (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);
```

- 1 *Mandates*: A unique function with the indicated name can be applied (unqualified) to an operand of type T. This function returns a value of type T or which can be unambiguously implicitly converted to type T.

28.6.3.4 Specialized algorithms

[valarray.special]

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

- 1 *Effects*: Equivalent to x.swap(y).

28.6.4 Class slice

[class.slice]

28.6.4.1 Overview

[class.slice.overview]

```
namespace std {
    class slice {
public:
    slice();
    slice(size_t, size_t, size_t);
    slice(const slice&);

    size_t start() const;
    size_t size() const;
    size_t stride() const;

    friend bool operator==(const slice& x, const slice& y);
};}
```

- ¹ The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.²³⁶

28.6.4.2 Constructors

[`cons.slice`]

```
slice();
slice(size_t start, size_t length, size_t stride);
```

- ¹ The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.
- ² [Example 1: `slice(3, 8, 2)` constructs a slice which selects elements 3, 5, 7, ..., 17 from an array. —end example]

28.6.4.3 Access functions

[`slice.access`]

```
size_t start() const;
size_t size() const;
size_t stride() const;
```

- ¹ Returns: The start, length, or stride specified by a `slice` object.
- ² Complexity: Constant time.

28.6.4.4 Operators

[`slice.ops`]

```
friend bool operator==(const slice& x, const slice& y);
```

- ¹ Effects: Equivalent to:

```
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

28.6.5 Class template `slice_array`

[`template.slice.array`]

28.6.5.1 Overview

[`template.slice.array.overview`]

```
namespace std {
    template<class T> class slice_array {
        public:
            using value_type = T;

            void operator= (const valarray<T>&) const;
            void operator*=(const valarray<T>&) const;
            void operator/=(const valarray<T>&) const;
            void operator%=(const valarray<T>&) const;
            void operator+=(const valarray<T>&) const;
            void operator-=(const valarray<T>&) const;
            void operator^=(const valarray<T>&) const;
            void operator&=(const valarray<T>&) const;
            void operator|=(const valarray<T>&) const;
            void operator<<=(const valarray<T>&) const;
            void operator>>=(const valarray<T>&) const;

            slice_array(const slice_array&);
            ~slice_array();
            const slice_array& operator=(const slice_array&) const;
            void operator=(const T&) const;

            slice_array() = delete;      // as implied by declaring copy constructor above
    };
}
```

- ¹ This template is a helper template used by the `slice` subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```

²³⁶) BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

- ² It has reference semantics to a subset of an array specified by a `slice` object.

[*Example 1*: The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are 1, 4, ..., 13. — *end example*]

28.6.5.2 Assignment

[`slice.arr.assign`]

```
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

- ¹ These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

28.6.5.3 Compound assignment

[`slice.arr.comp.assign`]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- ¹ These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

28.6.5.4 Fill function

[`slice.arr.fill`]

```
void operator=(const T&) const;
```

- ¹ This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

28.6.6 The `gslice` class

[`class.gslice`]

28.6.6.1 Overview

[`class.gslice.overview`]

```
namespace std {
    class gslice {
    public:
        gslice();
        gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

        size_t start() const;
        valarray<size_t> size() const;
        valarray<size_t> stride() const;
    };
}
```

- ¹ This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset (s), a set of lengths (l_j), and a set of strides (d_j). The number of lengths shall equal the number of strides.
- ² A `gslice` represents a mapping from a set of indices (i_j), equal in number to the number of strides, to a single index k . It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices i_j range in value from 0 to $l_{ij} - 1$.

- ³ [*Example 1*: The `gslice` specification

```
start = 3
length = {2, 4, 3}
stride = {19, 4, 1}
```

yields the sequence of one-dimensional indices

$$k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1$$

which are ordered as shown in the following table:

$(i_0, \quad i_1, \quad i_2, \quad k) \quad =$
$(0, \quad 0, \quad 0, \quad 3),$
$(0, \quad 0, \quad 1, \quad 4),$
$(0, \quad 0, \quad 2, \quad 5),$
$(0, \quad 1, \quad 0, \quad 7),$
$(0, \quad 1, \quad 1, \quad 8),$
$(0, \quad 1, \quad 2, \quad 9),$
$(0, \quad 2, \quad 0, \quad 11),$
$(0, \quad 2, \quad 1, \quad 12),$
$(0, \quad 2, \quad 2, \quad 13),$
$(0, \quad 3, \quad 0, \quad 15),$
$(0, \quad 3, \quad 1, \quad 16),$
$(0, \quad 3, \quad 2, \quad 17),$
$(1, \quad 0, \quad 0, \quad 22),$
$(1, \quad 0, \quad 1, \quad 23),$
\dots
$(1, \quad 3, \quad 2, \quad 36)$

That is, the highest-ordered index turns fastest. — *end example*]

⁴ It is possible to have degenerate generalized slices in which an address is repeated.

⁵ [Example 2: If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

$(0, \quad 0, \quad 0, \quad 3),$
$(0, \quad 0, \quad 1, \quad 4),$
$(0, \quad 0, \quad 2, \quad 5),$
$(0, \quad 1, \quad 0, \quad 4),$
$(0, \quad 1, \quad 1, \quad 5),$
$(0, \quad 1, \quad 2, \quad 6),$
\dots

— *end example*]

⁶ If a degenerate slice is used as the argument to the non-const version of `operator[]` (`const gsllice&`), the behavior is undefined.

28.6.6.2 Constructors

[`gsllice.cons`]

```
gsllice();
gsllice(size_t start, const valarray<size_t>& lengths,
        const valarray<size_t>& strides);
```

¹ The default constructor is equivalent to `gsllice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gsllice` based on a specification of start, lengths, and strides, as explained in the previous subclause.

28.6.6.3 Access functions

[`gsllice.access`]

```
size_t          start()  const;
valarray<size_t> size()  const;
valarray<size_t> stride() const;
```

¹ *Returns:* The representation of the start, lengths, or strides specified for the `gsllice`.

² *Complexity:* `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

28.6.7 Class template `gslice_array`

[`template.gslice.array`]

28.6.7.1 Overview

[`template.gslice.array.overview`]

```
namespace std {
    template<class T> class gslice_array {
        public:
            using value_type = T;

            void operator= (const valarray<T>&) const;
            void operator*= (const valarray<T>&) const;
            void operator/= (const valarray<T>&) const;
            void operator%=(const valarray<T>&) const;
            void operator+= (const valarray<T>&) const;
            void operator-= (const valarray<T>&) const;
            void operator^=(const valarray<T>&) const;
            void operator&=(const valarray<T>&) const;
            void operator|= (const valarray<T>&) const;
            void operator<<=(const valarray<T>&) const;
            void operator>>=(const valarray<T>&) const;

            gslice_array(const gslice_array&);
            ~gslice_array();
            const gslice_array& operator=(const gslice_array&) const;
            void operator=(const T&) const;

            gslice_array() = delete; // as implied by declaring copy constructor above
    };
}
```

¹ This template is a helper template used by the `gslice` subscript operator

```
gslice_array<T> valarray<T>::operator[](const gslice&);
```

² It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

28.6.7.2 Assignment

[`gslice.array.assign`]

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

¹ These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

28.6.7.3 Compound assignment

[`gslice.array.comp.assign`]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

¹ These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

28.6.7.4 Fill function

[`gslice.array.fill`]

```
void operator=(const T&) const;
```

¹ This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

28.6.8 Class template `mask_array`

[`template.mask.array`]

28.6.8.1 Overview

[`template.mask.array.overview`]

```
namespace std {
    template<class T> class mask_array {
        public:
            using value_type = T;

            void operator= (const valarray<T>&) const;
            void operator*= (const valarray<T>&) const;
            void operator/= (const valarray<T>&) const;
            void operator%=(const valarray<T>&) const;
            void operator+= (const valarray<T>&) const;
            void operator-= (const valarray<T>&) const;
            void operator^=(const valarray<T>&) const;
            void operator&=(const valarray<T>&) const;
            void operator|= (const valarray<T>&) const;
            void operator<<=(const valarray<T>&) const;
            void operator>>=(const valarray<T>&) const;

            mask_array(const mask_array&);
            ~mask_array();
            const mask_array& operator=(const mask_array&) const;
            void operator=(const T&) const;

            mask_array() = delete; // as implied by declaring copy constructor above
    };
}
```

- ¹ This template is a helper template used by the mask subscript operator:

```
mask_array<T> valarray<T>::operator[](const valarray<bool>&);
```

- ² It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`).

28.6.8.2 Assignment

[`mask.array.assign`]

```
void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;
```

- ¹ These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `mask_array` object refers.

28.6.8.3 Compound assignment

[`mask.array.comp.assign`]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

- ¹ These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `mask_array` object refers.

28.6.8.4 Fill function

[`mask.array.fill`]

```
void operator=(const T&) const;
```

- ¹ This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

28.6.9 Class template indirect_array

[template.indirect.array]

28.6.9.1 Overview

[template.indirect.array.overview]

```
namespace std {
    template<class T> class indirect_array {
        public:
            using value_type = T;

            void operator= (const valarray<T>&) const;
            void operator*= (const valarray<T>&) const;
            void operator/= (const valarray<T>&) const;
            void operator%= (const valarray<T>&) const;
            void operator+= (const valarray<T>&) const;
            void operator-= (const valarray<T>&) const;
            void operator^= (const valarray<T>&) const;
            void operator&= (const valarray<T>&) const;
            void operator|= (const valarray<T>&) const;
            void operator<<=(const valarray<T>&) const;
            void operator>>=(const valarray<T>&) const;

            indirect_array(const indirect_array&);
            ~indirect_array();
            const indirect_array& operator=(const indirect_array&) const;
            void operator=(const T&) const;

            indirect_array() = delete; // as implied by declaring copy constructor above
    };
}
```

¹ This template is a helper template used by the indirect subscript operator

```
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&);
```

² It has reference semantics to a subset of an array specified by an `indirect_array`. Thus, the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

28.6.9.2 Assignment

[indirect.array.assign]

```
void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;
```

- ¹ These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.
- ² If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.
- ³ [Example 1:

```
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
```

results in undefined behavior since element 4 is specified twice in the indirection. — end example]

28.6.9.3 Compound assignment

[indirect.array.comp.assign]

```
void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
```

```
void operator>>=(const valarray<T>&) const;
```

- 1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.
- 2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

28.6.9.4 Fill function

[`indirect.array.fill`]

```
void operator=(const T&) const;
```

- 1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

28.6.10 valarray range access

[`valarray.range`]

- 1 In the `begin` and `end` function templates that follow, `unspecified1` is a type that meets the requirements of a mutable `Cpp17RandomAccessIterator` (25.3.5.7) and models `contiguous_iterator` (25.3.4.14), whose `value_type` is the template parameter `T` and whose `reference` type is `T&`. `unspecified2` is a type that meets the requirements of a constant `Cpp17RandomAccessIterator` and models `contiguous_iterator`, whose `value_type` is the template parameter `T` and whose `reference` type is `const T&`.
- 2 The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
```

- 3 *Returns:* An iterator referencing the first value in the array.

```
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
```

- 4 *Returns:* An iterator referencing one past the last value in the array.

28.7 Mathematical functions for floating-point types

[`c.math`]

28.7.1 Header <cmath> synopsis

[`cmath.syn`]

    constexpr floating-point-type exp(floating-point-type x);
    constexpr float expf(float x);
    constexpr long double expl(long double x);

    constexpr floating-point-type exp2(floating-point-type x);
    constexpr float exp2f(float x);
    constexpr long double exp2l(long double x);

    constexpr floating-point-type expm1(floating-point-type x);
    constexpr float expm1f(float x);
    constexpr long double expm1l(long double x);
}

```

```

constexpr floating-point-type frexp(floating-point-type value, int* exp);
constexpr float frexpf(float value, int* exp);
constexpr long double frexpl(long double value, int* exp);

constexpr int ilogb(floating-point-type x);
constexpr int ilogbf(float x);
constexpr int ilogbl(long double x);

constexpr floating-point-type ldexp(floating-point-type x, int exp);
constexpr float ldexpf(float x, int exp);
constexpr long double ldexpl(long double x, int exp);

constexpr floating-point-type log(floating-point-type x);
constexpr float logf(float x);
constexpr long double logl(long double x);

constexpr floating-point-type log10(floating-point-type x);
constexpr float log10f(float x);
constexpr long double log10l(long double x);

constexpr floating-point-type log1p(floating-point-type x);
constexpr float log1pf(float x);
constexpr long double log1pl(long double x);

constexpr floating-point-type log2(floating-point-type x);
constexpr float log2f(float x);
constexpr long double log2l(long double x);

constexpr floating-point-type logb(floating-point-type x);
constexpr float logbf(float x);
constexpr long double logbl(long double x);

constexpr floating-point-type modf(floating-point-type value, floating-point-type* iptr);
constexpr float modff(float value, float* iptr);
constexpr long double modfl(long double value, long double* iptr);

constexpr floating-point-type scalbn(floating-point-type x, int n);
constexpr float scalbnf(float x, int n);
constexpr long double scalbnl(long double x, int n);

constexpr floating-point-type scalbln(floating-point-type x, long int n);
constexpr float scalblnf(float x, long int n);
constexpr long double scalblnl(long double x, long int n);

constexpr floating-point-type cbrt(floating-point-type x);
constexpr float cbrtf(float x);
constexpr long double cbrtl(long double x);

// 28.7.2, absolute values
constexpr int abs(int j);                                // freestanding
constexpr long int abs(long int j);                      // freestanding
constexpr long long int abs(long long int j);           // freestanding
constexpr floating-point-type abs(floating-point-type j); // freestanding-deleted

constexpr floating-point-type fabs(floating-point-type x);
constexpr float fabsf(float x);
constexpr long double fabsl(long double x);

constexpr floating-point-type hypot(floating-point-type x, floating-point-type y);
constexpr float hypotf(float x, float y);
constexpr long double hypotl(long double x, long double y);

```

```
// 28.7.3, three-dimensional hypotenuse
constexpr floating-point-type hypot(floating-point-type x, floating-point-type y,
                                     floating-point-type z);

constexpr floating-point-type pow(floating-point-type x, floating-point-type y);
constexpr float powf(float x, float y);
constexpr long double powl(long double x, long double y);

constexpr floating-point-type sqrt(floating-point-type x);
constexpr float sqrtf(float x);
constexpr long double sqrtl(long double x);

constexpr floating-point-type erf(floating-point-type x);
constexpr float erff(float x);
constexpr long double erfl(long double x);

constexpr floating-point-type erfc(floating-point-type x);
constexpr float erfcf(float x);
constexpr long double erfccl(long double x);

constexpr floating-point-type lgamma(floating-point-type x);
constexpr float lgammaf(float x);
constexpr long double lgammal(long double x);

constexpr floating-point-type tgamma(floating-point-type x);
constexpr float tgammaf(float x);
constexpr long double tgammal(long double x);

constexpr floating-point-type ceil(floating-point-type x);
constexpr float ceillf(float x);
constexpr long double ceilll(long double x);

constexpr floating-point-type floor(floating-point-type x);
constexpr float floorf(float x);
constexpr long double floorl(long double x);

floating-point-type nearbyint(floating-point-type x);
float nearbyintf(float x);
long double nearbyintl(long double x);

floating-point-type rint(floating-point-type x);
float rintf(float x);
long double rintl(long double x);

long int lrint(floating-point-type x);
long int lrntf(float x);
long int lrntl(long double x);

long long int llrint(floating-point-type x);
long long int llrintf(float x);
long long int llrintl(long double x);

constexpr floating-point-type round(floating-point-type x);
constexpr float roundf(float x);
constexpr long double roundl(long double x);

constexpr long int lround(floating-point-type x);
constexpr long int lrndf(float x);
constexpr long int lrndl(long double x);

constexpr long long int llround(floating-point-type x);
constexpr long long int llrndf(float x);
constexpr long long int llrndl(long double x);
```

```

constexpr floating-point-type trunc(floating-point-type x);
constexpr float truncf(float x);
constexpr long double truncl(long double x);

constexpr floating-point-type fmod(floating-point-type x, floating-point-type y);
constexpr float fmodf(float x, float y);
constexpr long double fmodl(long double x, long double y);

constexpr floating-point-type remainder(floating-point-type x, floating-point-type y);
constexpr float remainderf(float x, float y);
constexpr long double remainderl(long double x, long double y);

constexpr floating-point-type remquo(floating-point-type x, floating-point-type y, int* quo);
constexpr float remquof(float x, float y, int* quo);
constexpr long double remquol(long double x, long double y, int* quo);

constexpr floating-point-type copysign(floating-point-type x, floating-point-type y);
constexpr float copysignf(float x, float y);
constexpr long double copysignl(long double x, long double y);

double nan(const char* tagp);
float nanf(const char* tagp);
long double nanl(const char* tagp);

constexpr floating-point-type nextafter(floating-point-type x, floating-point-type y);
constexpr float nextafterf(float x, float y);
constexpr long double nextafterl(long double x, long double y);

constexpr floating-point-type nexttoward(floating-point-type x, long double y);
constexpr float nexttowardf(float x, long double y);
constexpr long double nexttowardl(long double x, long double y);

constexpr floating-point-type fdim(floating-point-type x, floating-point-type y);
constexpr float fdimf(float x, float y);
constexpr long double fdiml(long double x, long double y);

constexpr floating-point-type fmax(floating-point-type x, floating-point-type y);
constexpr float fmaxf(float x, float y);
constexpr long double fmaxl(long double x, long double y);

constexpr floating-point-type fmin(floating-point-type x, floating-point-type y);
constexpr float fminf(float x, float y);
constexpr long double fminl(long double x, long double y);

constexpr floating-point-type fma(floating-point-type x, floating-point-type y,
                                 floating-point-type z);
constexpr float fmaf(float x, float y, float z);
constexpr long double fmal(long double x, long double y, long double z);

// 28.7.4, linear interpolation
constexpr floating-point-type lerp(floating-point-type a, floating-point-type b,
                                    floating-point-type t) noexcept;

// 28.7.5, classification / comparison functions
constexpr int fpclassify(floating-point-type x);
constexpr bool isfinite(floating-point-type x);
constexpr bool isinf(floating-point-type x);
constexpr bool isnan(floating-point-type x);
constexpr bool isnormal(floating-point-type x);
constexpr bool signbit(floating-point-type x);
constexpr bool isgreater(floating-point-type x, floating-point-type y);
constexpr bool isgreaterequal(floating-point-type x, floating-point-type y);
constexpr bool isless(floating-point-type x, floating-point-type y);
constexpr bool islessequal(floating-point-type x, floating-point-type y);

```

```

constexpr bool islessgreater(floating-point-type x, floating-point-type y);
constexpr bool isunordered(floating-point-type x, floating-point-type y);

// 28.7.6, mathematical special functions

// 28.7.6.2, associated Laguerre polynomials
floating-point-type assoc_laguerre(unsigned n, unsigned m, floating-point-type x);
float assoc_laguerref(unsigned n, unsigned m, float x);
long double assoc_laguerrel(unsigned n, unsigned m, long double x);

// 28.7.6.3, associated Legendre functions
floating-point-type assoc_legendre(unsigned l, unsigned m, floating-point-type x);
float assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);

// 28.7.6.4, beta function
floating-point-type beta(floating-point-type x, floating-point-type y);
float betaf(float x, float y);
long double betal(long double x, long double y);

// 28.7.6.5, complete elliptic integral of the first kind
floating-point-type comp_ellint_1(floating-point-type k);
float comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);

// 28.7.6.6, complete elliptic integral of the second kind
floating-point-type comp_ellint_2(floating-point-type k);
float comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);

// 28.7.6.7, complete elliptic integral of the third kind
floating-point-type comp_ellint_3(floating-point-type k, floating-point-type nu);
float comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);

// 28.7.6.8, regular modified cylindrical Bessel functions
floating-point-type cyl_bessel_i(floating-point-type nu, floating-point-type x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);

// 28.7.6.9, cylindrical Bessel functions of the first kind
floating-point-type cyl_bessel_j(floating-point-type nu, floating-point-type x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);

// 28.7.6.10, irregular modified cylindrical Bessel functions
floating-point-type cyl_bessel_k(floating-point-type nu, floating-point-type x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);

// 28.7.6.11, cylindrical Neumann functions
// cylindrical Bessel functions of the second kind
floating-point-type cyl_neumann(floating-point-type nu, floating-point-type x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);

// 28.7.6.12, incomplete elliptic integral of the first kind
floating-point-type ellint_1(floating-point-type k, floating-point-type phi);
float ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);

// 28.7.6.13, incomplete elliptic integral of the second kind
floating-point-type ellint_2(floating-point-type k, floating-point-type phi);
float ellint_2f(float k, float phi);

```

```

long double ellint_2l(long double k, long double phi);

// 28.7.6.14, incomplete elliptic integral of the third kind
floating-point-type ellint_3(floating-point-type k, floating-point-type nu,
                               floating-point-type phi);
float      ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);

// 28.7.6.15, exponential integral
floating-point-type expint(floating-point-type x);
float      expintf(float x);
long double expintl(long double x);

// 28.7.6.16, Hermite polynomials
floating-point-type hermite(unsigned n, floating-point-type x);
float      hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);

// 28.7.6.17, Laguerre polynomials
floating-point-type laguerre(unsigned n, floating-point-type x);
float      laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);

// 28.7.6.18, Legendre polynomials
floating-point-type legendre(unsigned l, floating-point-type x);
float      legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);

// 28.7.6.19, Riemann zeta function
floating-point-type riemann_zeta(floating-point-type x);
float      riemann_zetaf(float x);
long double riemann_zetal(long double x);

// 28.7.6.20, spherical Bessel functions of the first kind
floating-point-type sph_bessel(unsigned n, floating-point-type x);
float      sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);

// 28.7.6.21, spherical associated Legendre functions
floating-point-type sph_legendre(unsigned l, unsigned m, floating-point-type theta);
float      sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);

// 28.7.6.22, spherical Neumann functions;
// spherical Bessel functions of the second kind
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float      sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
}

```

¹ The contents and meaning of the header <cmath> are the same as the C standard library header <math.h>, with the addition of a three-dimensional hypotenuse function (28.7.3), a linear interpolation function (28.7.4), and the mathematical special functions described in 28.7.6.

[Note 1: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — end note]

- 2 For each function with at least one parameter of type *floating-point-type*, the implementation provides an overload for each cv-unqualified floating-point type (6.8.2) where all uses of *floating-point-type* in the function signature are replaced with that floating-point type.
- 3 For each function with at least one parameter of type *floating-point-type* other than **abs**, the implementation also provides additional overloads sufficient to ensure that, if every argument corresponding to a *floating-point-type* parameter has arithmetic type, then every such argument is effectively cast to the floating-point type with the greatest floating-point conversion rank and greatest floating-point conversion subrank among the types of

all such arguments, where arguments of integer type are considered to have the same floating-point conversion rank as `double`. If no such floating-point type with the greatest rank and subrank exists, then overload resolution does not result in a usable candidate (12.2.1) from the overloads provided by the implementation.

- ⁴ An invocation of `nexttoward` is ill-formed if the argument corresponding to the *floating-point-type* parameter has extended floating-point type.

SEE ALSO: ISO/IEC 9899:2018, 7.12

28.7.2 Absolute values

[`c.math.abs`]

- ¹ [Note 1: The headers `<cstdlib>` (17.2.2) and `<cmath>` (28.7.1) declare the functions described in this subclause. — end note]

```
constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);
```

- ² Effects: These functions have the semantics specified in the C standard library for the functions `abs`, `labs`, and `llabs`, respectively.

- ³ Remarks: If `abs` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X` cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

[Note 2: Arguments that can be promoted to `int` are permitted for compatibility with C. — end note]

```
constexpr floating-point-type abs(floating-point-type x);
```

- ⁴ Returns: The absolute value of `x`.

SEE ALSO: ISO/IEC 9899:2018, 7.12.7.2, 7.22.6.1

28.7.3 Three-dimensional hypotenuse

[`c.math.hypot3`]

```
constexpr floating-point-type hypot(floating-point-type x, floating-point-type y,
                                    floating-point-type z);
```

- ¹ Returns: $\sqrt{x^2 + y^2 + z^2}$.

28.7.4 Linear interpolation

[`c.math.lerp`]

```
constexpr floating-point-type lerp(floating-point-type a, floating-point-type b,
                                    floating-point-type t) noexcept;
```

- ¹ Returns: $a + t(b - a)$.

² Remarks: Let `r` be the value returned. If `isfinite(a) && isfinite(b)`, then:

- (2.1) — If `t == 0`, then `r == a`.
- (2.2) — If `t == 1`, then `r == b`.
- (2.3) — If `t >= 0 && t <= 1`, then `isfinite(r)`.
- (2.4) — If `isfinite(t) && a == b`, then `r == a`.
- (2.5) — If `isfinite(t) || !isnan(t) && b-a != 0`, then `!isnan(r)`.

Let `CMP(x,y)` be 1 if $x > y$, -1 if $x < y$, and 0 otherwise. For any `t1` and `t2`, the product of `CMP(lerp(a, b, t2), lerp(a, b, t1))`, `CMP(t2, t1)`, and `CMP(b, a)` is non-negative.

28.7.5 Classification / comparison functions

[`c.math.fpclass`]

- ¹ The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library.

SEE ALSO: ISO/IEC 9899:2018, 7.12.3, 7.12.4

28.7.6 Mathematical special functions

[`sf.cmath`]

28.7.6.1 General

[`sf.cmath.general`]

- ¹ If any argument value to any of the functions specified in 28.7.6 is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

- (1.1) — the function description's *Returns*: element explicitly specifies a domain and those argument values fall outside the specified domain, or
 - (1.2) — the corresponding mathematical function value has a nonzero imaginary component, or
 - (1.3) — the corresponding mathematical function is not mathematically defined.²³⁷
- 2 Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

28.7.6.2 Associated Laguerre polynomials

[sf.cmath.assoc.laguerre]

```
floating-point-type assoc_laguerre(unsigned n, unsigned m, floating-point-type x);
float assoc_laguerref(unsigned n, unsigned m, float x);
long double assoc_laguerrel(unsigned n, unsigned m, long double x);
```

1 *Effects*: These functions compute the associated Laguerre polynomials of their respective arguments *n*, *m*, and *x*.

2 *Returns*:

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0,$$

where *n* is *n*, *m* is *m*, and *x* is *x*.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if *n* >= 128 or if *m* >= 128.

28.7.6.3 Associated Legendre functions

[sf.cmath.assoc.legendre]

```
floating-point-type assoc_legendre(unsigned l, unsigned m, floating-point-type x);
float assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
```

1 *Effects*: These functions compute the associated Legendre functions of their respective arguments *l*, *m*, and *x*.

2 *Returns*:

$$P_\ell^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_\ell(x), \quad \text{for } |x| \leq 1,$$

where *l* is *l*, *m* is *m*, and *x* is *x*.

3 *Remarks*: The effect of calling each of these functions is implementation-defined if *l* >= 128.

28.7.6.4 Beta function

[sf.cmath.beta]

```
floating-point-type beta(floating-point-type x, floating-point-type y);
float betaf(float x, float y);
long double betal(long double x, long double y);
```

1 *Effects*: These functions compute the beta function of their respective arguments *x* and *y*.

2 *Returns*:

$$B(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)}, \quad \text{for } x > 0, y > 0,$$

where *x* is *x* and *y* is *y*.

28.7.6.5 Complete elliptic integral of the first kind

[sf.cmath.comp.ellint.1]

```
floating-point-type comp_ellint_1(floating-point-type k);
float comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
```

1 *Effects*: These functions compute the complete elliptic integral of the first kind of their respective arguments *k*.

2 *Returns*:

$$K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1,$$

where *k* is *k*.

²³⁷⁾ A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.

3 See also 28.7.6.12.

28.7.6.6 Complete elliptic integral of the second kind

[sf.cmath.comp.ellint.2]

```
floating-point-type comp_ellint_2(floating-point-type k);
float comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

1 *Effects:* These functions compute the complete elliptic integral of the second kind of their respective arguments *k*.

2 *Returns:*

$$E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1,$$

where *k* is *k*.

3 See also 28.7.6.13.

28.7.6.7 Complete elliptic integral of the third kind

[sf.cmath.comp.ellint.3]

```
floating-point-type comp_ellint_3(floating-point-type k, floating-point-type nu);
float comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);
```

1 *Effects:* These functions compute the complete elliptic integral of the third kind of their respective arguments *k* and *nu*.

2 *Returns:*

$$\Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for } |k| \leq 1,$$

where *k* is *k* and *nu* is *nu*.

3 See also 28.7.6.14.

28.7.6.8 Regular modified cylindrical Bessel functions

[sf.cmath.cyl.bessel.i]

```
floating-point-type cyl_bessel_i(floating-point-type nu, floating-point-type x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

1 *Effects:* These functions compute the regular modified cylindrical Bessel functions of their respective arguments *nu* and *x*.

2 *Returns:*

$$I_\nu(x) = i^{-\nu} J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where *nu* is *nu* and *x* is *x*.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if *nu* >= 128.

4 See also 28.7.6.9.

28.7.6.9 Cylindrical Bessel functions of the first kind

[sf.cmath.cyl.bessel.j]

```
floating-point-type cyl_bessel_j(floating-point-type nu, floating-point-type x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Bessel functions of the first kind of their respective arguments *nu* and *x*.

2 *Returns:*

$$J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where *nu* is *nu* and *x* is *x*.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if *nu* >= 128.

28.7.6.10 Irregular modified cylindrical Bessel functions [sf.cmath.cyl.bessel.k]

```
floating-point-type cyl_bessel_k(floating-point-type nu, floating-point-type x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

1 *Effects:* These functions compute the irregular modified cylindrical Bessel functions of their respective arguments **nu** and **x**.

2 *Returns:*

$$K_\nu(x) = (\pi/2)i^{\nu+1}(J_\nu(ix) + iN_\nu(ix)) = \begin{cases} \frac{\pi}{2} \frac{I_{-\nu}(x) - I_\nu(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \frac{\pi}{2} \lim_{\mu \rightarrow \nu} \frac{I_{-\mu}(x) - I_\mu(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where ν is **nu** and x is **x**.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if **nu** $>= 128.$

4 See also [28.7.6.8](#), [28.7.6.9](#), [28.7.6.11](#).

28.7.6.11 Cylindrical Neumann functions [sf.cmath.cyl.neumann]

```
floating-point-type cyl_neumann(floating-point-type nu, floating-point-type x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 *Effects:* These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments **nu** and **x**.

2 *Returns:*

$$N_\nu(x) = \begin{cases} \frac{J_\nu(x) \cos \nu\pi - J_{-\nu}(x)}{\sin \nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim_{\mu \rightarrow \nu} \frac{J_\mu(x) \cos \mu\pi - J_{-\mu}(x)}{\sin \mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases}$$

where ν is **nu** and x is **x**.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if **nu** $>= 128.$

4 See also [28.7.6.9](#).

28.7.6.12 Incomplete elliptic integral of the first kind [sf.cmath.ellint.1]

```
floating-point-type ellint_1(floating-point-type k, floating-point-type phi);
float ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

1 *Effects:* These functions compute the incomplete elliptic integral of the first kind of their respective arguments **k** and **phi** (**phi** measured in radians).

2 *Returns:*

$$F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1,$$

where k is **k** and ϕ is **phi**.

28.7.6.13 Incomplete elliptic integral of the second kind [sf.cmath.ellint.2]

```
floating-point-type ellint_2(floating-point-type k, floating-point-type phi);
float ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

1 *Effects:* These functions compute the incomplete elliptic integral of the second kind of their respective arguments **k** and **phi** (**phi** measured in radians).

2 *Returns:*

$$E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta} d\theta, \quad \text{for } |k| \leq 1,$$

where k is **k** and ϕ is **phi**.

28.7.6.14 Incomplete elliptic integral of the third kind

[sf.cmath.ellint.3]

```
floating-point-type ellint_3(floating-point-type k, floating-point-type nu,
                           floating-point-type phi);
float      ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

1 *Effects:* These functions compute the incomplete elliptic integral of the third kind of their respective arguments **k**, **nu**, and **phi** (**phi** measured in radians).

2 *Returns:*

$$\Pi(\nu, k, \phi) = \int_0^\phi \frac{d\theta}{(1 - \nu \sin^2 \theta)\sqrt{1 - k^2 \sin^2 \theta}}, \quad \text{for } |k| \leq 1,$$

where ν is **nu**, k is **k**, and ϕ is **phi**.

28.7.6.15 Exponential integral

[sf.cmath.expint]

```
floating-point-type expint(floating-point-type x);
float      expintf(float x);
long double expintl(long double x);
```

1 *Effects:* These functions compute the exponential integral of their respective arguments **x**.

2 *Returns:*

$$\text{Ei}(x) = - \int_{-x}^{\infty} \frac{e^{-t}}{t} dt$$

where x is **x**.

28.7.6.16 Hermite polynomials

[sf.cmath.hermite]

```
floating-point-type hermite(unsigned n, floating-point-type x);
float      hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

1 *Effects:* These functions compute the Hermite polynomials of their respective arguments **n** and **x**.

2 *Returns:*

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

where n is **n** and x is **x**.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if **n** \geq 128.

28.7.6.17 Laguerre polynomials

[sf.cmath.laguerre]

```
floating-point-type laguerre(unsigned n, floating-point-type x);
float      laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1 *Effects:* These functions compute the Laguerre polynomials of their respective arguments **n** and **x**.

2 *Returns:*

$$L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}), \quad \text{for } x \geq 0,$$

where n is **n** and x is **x**.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if **n** \geq 128.

28.7.6.18 Legendre polynomials

[sf.cmath.legendre]

```
floating-point-type legendre(unsigned l, floating-point-type x);
float      legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1 *Effects:* These functions compute the Legendre polynomials of their respective arguments **l** and **x**.

2 *Returns:*

$$P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l, \quad \text{for } |x| \leq 1,$$

where l is **l** and x is **x**.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if **l** \geq 128.

28.7.6.19 Riemann zeta function

[sf.cmath.riemann.zeta]

```
floating-point-type riemann_zeta(floating-point-type x);
float          riemann_zetaf(float x);
long double   riemann_zetal(long double x);
```

1 *Effects:* These functions compute the Riemann zeta function of their respective arguments *x*.

2 *Returns:*

$$\zeta(x) = \begin{cases} \sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \frac{1}{1 - 2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\ 2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0 \end{cases}$$

where *x* is *x*.

28.7.6.20 Spherical Bessel functions of the first kind

[sf.cmath.sph.bessel]

```
floating-point-type sph_bessel(unsigned n, floating-point-type x);
float          sph_besself(unsigned n, float x);
long double   sph_bessell(unsigned n, long double x);
```

1 *Effects:* These functions compute the spherical Bessel functions of the first kind of their respective arguments *n* and *x*.

2 *Returns:*

$$j_n(x) = (\pi/2x)^{1/2} J_{n+1/2}(x), \quad \text{for } x \geq 0,$$

where *n* is *n* and *x* is *x*.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if *n* >= 128.

4 See also [28.7.6.9](#).

28.7.6.21 Spherical associated Legendre functions

[sf.cmath.sph.legendre]

```
floating-point-type sph_legendre(unsigned l, unsigned m, floating-point-type theta);
float          sph_legendref(unsigned l, unsigned m, float theta);
long double   sph_legendrel(unsigned l, unsigned m, long double theta);
```

1 *Effects:* These functions compute the spherical associated Legendre functions of their respective arguments *l*, *m*, and *theta* (*theta* measured in radians).

2 *Returns:*

$$Y_\ell^m(\theta, 0)$$

where

$$Y_\ell^m(\theta, \phi) = (-1)^m \left[\frac{(2\ell+1)}{4\pi} \frac{(\ell-m)!}{(\ell+m)!} \right]^{1/2} P_\ell^m(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq \ell,$$

and *l* is *l*, *m* is *m*, and *theta* is *theta*.

3 *Remarks:* The effect of calling each of these functions is implementation-defined if *l* >= 128.

4 See also [28.7.6.3](#).

28.7.6.22 Spherical Neumann functions

[sf.cmath.sph.neumann]

```
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float          sph_neumannf(unsigned n, float x);
long double   sph_neumannl(unsigned n, long double x);
```

1 *Effects:* These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments *n* and *x*.

2 *Returns:*

$$N_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x), \quad \text{for } x \geq 0,$$

where n is `n` and x is `x`.

- 3 *Remarks:* The effect of calling each of these functions is implementation-defined if `n >= 128`.
 4 See also [28.7.6.11](#).

28.8 Numbers

28.8.2 Mathematical constants

[math.constants]

- 1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of e , $\log_2 e$, $\log_{10} e$, π , $\frac{1}{\pi}$, $\frac{1}{\sqrt{\pi}}$, $\ln 2$, $\ln 10$, $\sqrt{2}$, $\sqrt{3}$, $\frac{1}{\sqrt{3}}$, the Euler-Mascheroni γ constant, and the golden ratio ϕ constant $\frac{1+\sqrt{5}}{2}$, respectively.
 2 Pursuant to [16.4.5.2.1](#), a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.
 3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.

29 Time library [time]

29.1 General [time.general]

- ¹ This Clause describes the chrono library (29.2) and various C functions (29.15) that provide generally useful time utilities, as summarized in Table 98.

Table 98 — Time library summary [tab:time.summary]

Subclause	Header
29.3	<i>Cpp17Clock</i> requirements
29.4	Time-related traits <chrono>
29.5	Class template duration
29.6	Class template time_point
29.7	Clocks
29.8	Civil calendar
29.9	Class template hh_mm_ss
29.10	12/24 hour functions
29.11	Time zones
29.12	Formatting
29.13	Parsing
29.14	Hash support
29.15	C library time utilities <ctime>

² Let *STATICALLY-WIDEN*<charT>("...") be "..." if charT is char and L"..." if charT is wchar_t.

29.2 Header <chrono> synopsis [time.syn]

```
#include <compare> // see 17.11.1

namespace std::chrono {
    // 29.5, class template duration
    template<class Rep, class Period = ratio<1>> class duration;

    // 29.6, class template time_point
    template<class Clock, class Duration = typename Clock::duration> class time_point;
}

```

29.3 Cpp17Clock requirements

[time.clock.req]

- ¹ A clock is a bundle consisting of a duration, a time_point, and a function now() to get the current time_point. The origin of the clock's time_point is referred to as the clock's epoch. A clock shall meet the requirements in [Table 99](#).
- ² In [Table 99](#) C1 and C2 denote clock types. t1 and t2 are values returned by C1::now() where the call returning t1 happens before [\(6.9.2\)](#) the call returning t2 and both of these calls occur before C1::time_point::max().
[Note 1: This means C1 did not wrap around between t1 and t2. — end note]

Table 99 — Cpp17Clock requirements [tab:time.clock]

Expression	Return type	Operational semantics
C1::rep	An arithmetic type or a class emulating an arithmetic type	The representation type of C1::duration.

Table 99 — *Cpp17Clock* requirements (continued)

Expression	Return type	Operational semantics
C1::period	a specialization of ratio	The tick period of the clock in seconds.
C1::duration	chrono::duration<C1::rep, C1::period>	The duration type of the clock.
C1::time_point	chrono::time_point<C1> or chrono::time_point<C2, C1::duration>	The time_point type of the clock. C1 and C2 shall refer to the same epoch.
C1::is_steady	const bool	true if t1 <= t2 is always true and the time between clock ticks is constant, otherwise false.
C1::now()	C1::time_point	Returns a time_point object representing the current point in time.

³ [Note 2: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. — end note]

⁴ A type TC meets the *Cpp17TrivialClock* requirements if:

- (4.1) — TC meets the *Cpp17Clock* requirements,
- (4.2) — the types TC::rep, TC::duration, and TC::time_point meet the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) and *Cpp17Swappable* (16.4.4.3) requirements and the requirements of numeric types (28.2),
[Note 3: This means, in particular, that operations on these types will not throw exceptions. — end note]
- (4.3) — the function TC::now() does not throw exceptions, and
- (4.4) — the type TC::time_point::clock meets the *Cpp17TrivialClock* requirements, recursively.

29.4 Time-related traits

[time.traits]

29.4.1 treat_as_floating_point

[time.traits.is.fp]

```
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

¹ The duration template uses the treat_as_floating_point trait to help determine if a duration object can be converted to another duration with a different tick period. If treat_as_floating_point_v<Rep> is true, then implicit conversions are allowed among durations. Otherwise, the implicit convertibility depends on the tick periods of the durations.

[Note 1: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If treat_as_floating_point_v<Rep> is false, Rep will be treated as if it behaved like an integral type for the purpose of these conversions. — end note]

29.4.2 duration_values

[time.traits.duration.values]

```
template<class Rep>
struct duration_values {
public:
    static constexpr Rep zero() noexcept;
    static constexpr Rep min() noexcept;
    static constexpr Rep max() noexcept;
};
```

¹ The duration template uses the duration_values trait to construct special values of the duration's representation (Rep). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize duration_values to return the indicated values.

```
static constexpr Rep zero() noexcept;
```

² Returns: Rep(0).

[Note 1: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value. —end note]

- 3 *Remarks:* The value returned shall be the additive identity.

```
static constexpr Rep min() noexcept;
4     Returns: numeric_limits<Rep>::lowest().
5     Remarks: The value returned shall compare less than or equal to zero().
static constexpr Rep max() noexcept;
6     Returns: numeric_limits<Rep>::max().
7     Remarks: The value returned shall compare greater than zero().
```

29.4.3 Specializations of `common_type`

[time.traits.specializations]

```
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
    using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

- 1 The period of the duration indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

[Note 1: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`. —end note]

- 2 [Note 2: The `typedef` name `type` is a synonym for the `duration` with the largest tick `period` possible where both `duration` arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors. —end note]

```
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```

- 3 The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two `durations`.

29.4.4 Class template `is_clock`

[time.traits.is.clock]

```
template<class T> struct is_clock;
```

- 1 `is_clock` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` meets the *Cpp17Clock* requirements (29.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the *Cpp17Clock* requirements is unspecified, except that as a minimum a type `T` shall not qualify as a *Cpp17Clock* unless it meets all of the following conditions:

- (1.1) — the *qualified-ids* `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.3),
 - (1.2) — the expression `T::is_steady` is well-formed when treated as an unevaluated operand (7.2.3),
 - (1.3) — the expression `T::now()` is well-formed when treated as an unevaluated operand.
- 2 The behavior of a program that adds specializations for `is_clock` is undefined.

29.5 Class template `duration`

[time.duration]

29.5.1 General

[time.duration.general]

- 1 A `duration` type measures time between two points in time (`time_points`). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```

namespace std::chrono {
    template<class Rep, class Period = ratio<1>>
    class duration {
        public:
            using rep      = Rep;
            using period = typename Period::type;

        private:
            rep rep_;           // exposition only

        public:
            // 29.5.2, construct/copy/destroy
            constexpr duration() = default;
            template<class Rep2>
                constexpr explicit duration(const Rep2& r);
            template<class Rep2, class Period2>
                constexpr duration(const duration<Rep2, Period2>& d);
            ~duration() = default;
            duration(const duration&) = default;
            duration& operator=(const duration&) = default;

            // 29.5.3, observer
            constexpr rep count() const;

            // 29.5.4, arithmetic
            constexpr common_type_t<duration> operator+() const;
            constexpr common_type_t<duration> operator-() const;
            constexpr duration& operator++();
            constexpr duration operator++(int);
            constexpr duration& operator--();
            constexpr duration operator--(int);

            constexpr duration& operator+=(const duration& d);
            constexpr duration& operator-=(const duration& d);

            constexpr duration& operator*=(const rep& rhs);
            constexpr duration& operator/=(const rep& rhs);
            constexpr duration& operator%=(const rep& rhs);
            constexpr duration& operator%=(const duration& rhs);

            // 29.5.5, special values
            static constexpr duration zero() noexcept;
            static constexpr duration min() noexcept;
            static constexpr duration max() noexcept;
        };
    };
}

```

- ² Rep shall be an arithmetic type or a class emulating an arithmetic type. If duration is instantiated with a duration type as the argument for the template parameter Rep, the program is ill-formed.
- ³ If Period is not a specialization of ratio, the program is ill-formed. If Period::num is not positive, the program is ill-formed.
- ⁴ Members of duration do not throw exceptions other than those thrown by the indicated operations on their representations.
- ⁵ The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization of the member rep_ for copy and move, respectively, would be constexpr-suitable (9.2.6).

⁶ [Example 1:

```

duration<long, ratio<60>> d0;           // holds a count of minutes using a long
duration<long long, milli> d1;           // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2; // holds a count with a tick period of  $\frac{1}{30}$  of a second
                                         // (30 Hz) using a double

```

— end example]

29.5.2 Constructors

[time.duration.cons]

```
template<class Rep2>
    constexpr explicit duration(const Rep2& r);

1   Constraints: is_convertible_v<const Rep2&, rep> is true and
(1.1)   — treat_as_floating_point_v<rep> is true or
(1.2)   — treat_as_floating_point_v<Rep2> is false.
```

[Example 1:

```
duration<int, milli> d(3);           // OK
duration<int, milli> d2(3.5);        // error
— end example]
```

2 Effects: Initializes rep_ with r.

```
template<class Rep2, class Period2>
    constexpr duration(const duration<Rep2, Period2>& d);
```

3 Constraints: No overflow is induced in the conversion and treat_as_floating_point_v<rep> is true or both ratio_divide<Period2, period>::den is 1 and treat_as_floating_point_v<Rep2> is false.

[Note 1: This requirement prevents implicit truncation error when converting between integral-based duration types. Such a construction could easily lead to confusion about the value of the duration. — end note]

[Example 2:

```
duration<int, milli> ms(3);
duration<int, micro> us = ms;          // OK
duration<int, milli> ms2 = us;         // error
— end example]
```

4 Effects: Initializes rep_ with duration_cast<duration>(d).count().

29.5.3 Observer

[time.duration.observer]

```
constexpr rep count() const;
```

1 Returns: rep_.

29.5.4 Arithmetic

[time.duration.arithmetic]

```
constexpr common_type_t<duration> operator+() const;
```

1 Returns: common_type_t<duration>(*this).

```
constexpr common_type_t<duration> operator-() const;
```

2 Returns: common_type_t<duration>(-rep_).

```
constexpr duration& operator++();
```

3 Effects: Equivalent to: ++rep_.

4 Returns: *this.

```
constexpr duration operator++(int);
```

5 Effects: Equivalent to: return duration(rep_++);

```
constexpr duration& operator--();
```

6 Effects: Equivalent to: --rep_.

7 Returns: *this.

```
constexpr duration operator--(int);
```

8 Effects: Equivalent to: return duration(rep_--);

```

constexpr duration& operator+=(const duration& d);
9   Effects: Equivalent to: rep_ += d.count().
10  Returns: *this.

constexpr duration& operator-=(const duration& d);
11  Effects: Equivalent to: rep_ -= d.count().
12  Returns: *this.

constexpr duration& operator*=(const rep& rhs);
13  Effects: Equivalent to: rep_ *= rhs.
14  Returns: *this.

constexpr duration& operator/=(const rep& rhs);
15  Effects: Equivalent to: rep_ /= rhs.
16  Returns: *this.

constexpr duration& operator%=(const rep& rhs);
17  Effects: Equivalent to: rep_ %= rhs.
18  Returns: *this.

constexpr duration& operator%=(const duration& rhs);
19  Effects: Equivalent to: rep_ %= rhs.count().
20  Returns: *this.

```

29.5.5 Special values

[time.duration.special]

```

static constexpr duration zero() noexcept;
1   Returns: duration(duration_values<rep>::zero()).

static constexpr duration min() noexcept;
2   Returns: duration(duration_values<rep>::min()).

static constexpr duration max() noexcept;
3   Returns: duration(duration_values<rep>::max()) .

```

29.5.6 Non-member arithmetic

[time.duration.nonmember]

- ¹ In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
2   Returns: CD(CD(lhs).count() + CD(rhs).count()) .

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
3   Returns: CD(CD(lhs).count() - CD(rhs).count()) .

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& d, const Rep2& s);
4   Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true.
5   Returns: CD(CD(d).count() * s) .

```

```

template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const Rep1& s, const duration<Rep2, Period>& d);
6   Constraints: is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>> is true.
7   Returns: d * s.

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator/(const duration<Rep1, Period>& d, const Rep2& s);
8   Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is
      not a specialization of duration.
9   Returns: CD(CD(d).count() / s).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<Rep1, Rep2>
operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
10  Let CD be common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.
11  Returns: CD(lhs).count() / CD(rhs).count().

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator%<(const duration<Rep1, Period>& d, const Rep2& s);
12  Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is
      not a specialization of duration.
13  Returns: CD(CD(d).count() % s).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator%<(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
14  Returns: CD(CD(lhs).count() % CD(rhs).count()).

```

29.5.7 Comparisons

[time.duration.comparisons]

- 1 In the function descriptions that follow, CT represents common_type_t<A, B>, where A and B are the types of the two arguments to the function.

```

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
2   Returns: CT(lhs).count() == CT(rhs).count().

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
3   Returns: CT(lhs).count() < CT(rhs).count().

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
4   Returns: rhs < lhs.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
5   Returns: !(rhs < lhs).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs),

```

```

    const duration<Rep2, Period2>& rhs);

6   Returns: !(lhs < rhs).

template<class Rep1, class Period1, class Rep2, class Period2>
  requires three_way_comparable<typename CT::rep>
  constexpr auto operator<=>(const duration<Rep1, Period1>& lhs,
                                const duration<Rep2, Period2>& rhs);

7   Returns: CT(lhs).count() <= CT(rhs).count().

```

29.5.8 Conversions

[time.duration.cast]

```

template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);

```

- 1 *Constraints:* ToDuration is a specialization of duration.
- 2 *Returns:* Let CF be ratio_divide<Period, typename ToDuration::period>, and CR be common_type<typename ToDuration::rep, Rep, intmax_t>::type.
 - (2.1) — If CF::num == 1 and CF::den == 1, returns

```
ToDuration(static_cast<typename ToDuration::rep>(d.count()))
```
 - (2.2) — otherwise, if CF::num != 1 and CF::den == 1, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
            static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))
```
 - (2.3) — otherwise, if CF::num == 1 and CF::den != 1, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
            static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))
```
 - (2.4) — otherwise, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
            static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))
```
- 3 [*Note 1:* This function does not use any implicit conversions; all conversions are done with static_cast. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — *end note*]

```

template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);

```

- 4 *Constraints:* ToDuration is a specialization of duration.
- 5 *Returns:* The greatest result t representable in ToDuration for which t <= d.

```

template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);

```

- 6 *Constraints:* ToDuration is a specialization of duration.
- 7 *Returns:* The least result t representable in ToDuration for which t >= d.

```

template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);

```

- 8 *Constraints:* ToDuration is a specialization of duration and treat_as_floating_point_v<typename ToDuration::rep> is false.
- 9 *Returns:* The value of ToDuration that is closest to d. If there are two closest values, then return the value t for which t % 2 == 0.

29.5.9 Suffixes for duration literals

[time.duration.literals]

- 1 This subclause describes literal suffixes for constructing duration literals. The suffixes h, min, s, ms, us, ns denote duration values of the corresponding types hours, minutes, seconds, milliseconds, microseconds, and nanoseconds respectively if they are applied to *integer-literals*.
- 2 If any of these suffixes are applied to a *floating-point-literal* the result is a chrono::duration literal with an unspecified floating-point representation.

³ If any of these suffixes are applied to an *integer-literal* and the resulting `chrono::duration` value cannot be represented in the result type because of overflow, the program is ill-formed.

⁴ [Example 1: The following code shows some duration literals.

```
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
— end example]
```

```
constexpr chrono::hours operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);
```

⁵ Returns: A duration literal representing hours hours.

```
constexpr chrono::minutes operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator""min(long double minutes);
```

⁶ Returns: A duration literal representing minutes minutes.

```
constexpr chrono::seconds operator""s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator""s(long double sec);
```

⁷ Returns: A duration literal representing sec seconds.

⁸ [Note 1: The same suffix s is used for `basic_string` but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

```
constexpr chrono::milliseconds operator""ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);
```

⁹ Returns: A duration literal representing msec milliseconds.

```
constexpr chrono::microseconds operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);
```

¹⁰ Returns: A duration literal representing usec microseconds.

```
constexpr chrono::nanoseconds operator""ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);
```

¹¹ Returns: A duration literal representing nsec nanoseconds.

29.5.10 Algorithms

[time.duration.alg]

```
template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);
```

¹ Constraints: `numeric_limits<Rep>::is_signed` is true.

² Returns: If `d >= d.zero()`, return `d`, otherwise return `-d`.

29.5.11 I/O

[time.duration.io]

```
template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);
```

¹ Effects: Inserts the duration `d` onto the stream `os` as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();
```

where `units-suffix` depends on the type `Period::type` as follows:

(1.1) — If `Period::type` is atto, `units-suffix` is "as".

(1.2) — Otherwise, if `Period::type` is femto, `units-suffix` is "fs".

- (1.3) — Otherwise, if `Period::type` is `pico`, `units-suffix` is "ps".
- (1.4) — Otherwise, if `Period::type` is `nano`, `units-suffix` is "ns".
- (1.5) — Otherwise, if `Period::type` is `micro`, it is implementation-defined whether `units-suffix` is "μs" ("u00b5\u0073") or "us".
- (1.6) — Otherwise, if `Period::type` is `milli`, `units-suffix` is "ms".
- (1.7) — Otherwise, if `Period::type` is `centi`, `units-suffix` is "cs".
- (1.8) — Otherwise, if `Period::type` is `deci`, `units-suffix` is "ds".
- (1.9) — Otherwise, if `Period::type` is `ratio<1>`, `units-suffix` is "s".
- (1.10) — Otherwise, if `Period::type` is `deca`, `units-suffix` is "das".
- (1.11) — Otherwise, if `Period::type` is `hecto`, `units-suffix` is "hs".
- (1.12) — Otherwise, if `Period::type` is `kilo`, `units-suffix` is "ks".
- (1.13) — Otherwise, if `Period::type` is `mega`, `units-suffix` is "Ms".
- (1.14) — Otherwise, if `Period::type` is `giga`, `units-suffix` is "Gs".
- (1.15) — Otherwise, if `Period::type` is `tera`, `units-suffix` is "Ts".
- (1.16) — Otherwise, if `Period::type` is `peta`, `units-suffix` is "Ps".
- (1.17) — Otherwise, if `Period::type` is `exa`, `units-suffix` is "Es".
- (1.18) — Otherwise, if `Period::type` is `ratio<60>`, `units-suffix` is "min".
- (1.19) — Otherwise, if `Period::type` is `ratio<3600>`, `units-suffix` is "h".
- (1.20) — Otherwise, if `Period::type` is `ratio<86400>`, `units-suffix` is "d".
- (1.21) — Otherwise, if `Period::type::den == 1`, `units-suffix` is "[num]s".
- (1.22) — Otherwise, `units-suffix` is "[num/den]s".

In the list above, the use of `num` and `den` refers to the static data members of `Period::type`, which are converted to arrays of `charT` using a decimal conversion with no leading zeroes.

2 >Returns: `os`.

```
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            duration<Rep, Period>& d,
            basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

3 Effects: Attempts to parse the input stream `is` into the duration `d` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid duration, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

4 >Returns: `is`.

29.6 Class template `time_point` [time.point]

29.6.1 General [time.point.general]

```
namespace std::chrono {
    template<class Clock, class Duration = typename Clock::duration>
    class time_point {
        public:
            using clock      = Clock;
            using duration   = Duration;
            using rep         = typename duration::rep;
            using period      = typename duration::period;

        private:
            duration d_;                                // exposition only
    };
}
```

```

public:
    // 29.6.2, construct
    constexpr time_point();                                // has value epoch
    constexpr explicit time_point(const duration& d);      // same as time_point() + d
    template<class Duration2>
        constexpr time_point(const time_point<clock, Duration2>& t);

    // 29.6.3, observer
    constexpr duration time_since_epoch() const;

    // 29.6.4, arithmetic
    constexpr time_point& operator++();
    constexpr time_point operator++(int);
    constexpr time_point& operator--();
    constexpr time_point operator--(int);
    constexpr time_point& operator+=(const duration& d);
    constexpr time_point& operator-=(const duration& d);

    // 29.6.5, special values
    static constexpr time_point min() noexcept;
    static constexpr time_point max() noexcept;
};

}

```

¹ If Duration is not a specialization of duration, the program is ill-formed.

29.6.2 Constructors

[time.point.cons]

```

constexpr time_point();

1   Effects: Initializes d_ with duration::zero(). Such a time_point object represents the epoch.

constexpr explicit time_point(const duration& d);

2   Effects: Initializes d_ with d. Such a time_point object represents the epoch + d.

template<class Duration2>
    constexpr time_point(const time_point<clock, Duration2>& t);

3   Constraints: is_convertible_v<Duration2, duration> is true.

4   Effects: Initializes d_ with t.time_since_epoch().

```

29.6.3 Observer

[time.point.observer]

```

constexpr duration time_since_epoch() const;

1   Returns: d_.

```

29.6.4 Arithmetic

[time.point.arithmetic]

```

constexpr time_point& operator++();

1   Effects: Equivalent to: ++d_.

2   Returns: *this.

constexpr time_point operator++(int);

3   Effects: Equivalent to: return time_point{d_++};

constexpr time_point& operator--();

4   Effects: Equivalent to: --d_.

5   Returns: *this.

constexpr time_point operator--(int);

6   Effects: Equivalent to: return time_point{d_--};

```

```

constexpr time_point& operator+=(const duration& d);
7   Effects: Equivalent to: d_ += d.
8   Returns: *this.

constexpr time_point& operator-=(const duration& d);
9   Effects: Equivalent to: d_ -= d.
10  Returns: *this.

```

29.6.5 Special values

[time.point.special]

```

static constexpr time_point min() noexcept;
1   Returns: time_point(duration::min()).

static constexpr time_point max() noexcept;
2   Returns: time_point(duration::max()).

```

29.6.6 Non-member arithmetic

[time.point.nonmember]

```

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);

1   Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>>
operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);

2   Returns: rhs + lhs.

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);

3   Returns: CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.

template<class Clock, class Duration1, class Duration2>
constexpr common_type_t<Duration1, Duration2>
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

4   Returns: lhs.time_since_epoch() - rhs.time_since_epoch().

```

29.6.7 Comparisons

[time.point.comparisons]

```

template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);

1   Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);

2   Returns: lhs.time_since_epoch() < rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);

3   Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);

4   Returns: !(rhs < lhs).

```

```

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);

5   Returns: !(lhs < rhs).

template<class Clock, class Duration1,
         three_way_comparable_with<Duration1> Duration2>
constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,
                             const time_point<Clock, Duration2>& rhs);

6   Returns: lhs.time_since_epoch() <= rhs.time_since_epoch().

```

29.6.8 Conversions

[time.point.cast]

```

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);

1   Constraints: ToDuration is a specialization of duration.

2   Returns:
    time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);

3   Constraints: ToDuration is a specialization of duration.

4   Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()));

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);

5   Constraints: ToDuration is a specialization of duration.

6   Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()));

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

7   Constraints: ToDuration is a specialization of duration, and treat_as_floating_point_v<typename
ToDuration::rep> is false.

8   Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch()));

```

29.7 Clocks

[time.clock]

29.7.1 General

[time.clock.general]

¹ The types defined in 29.7 meet the *Cpp17TrivialClock* requirements (29.3) unless otherwise specified.

29.7.2 Class system_clock

[time.clock.system]

29.7.2.1 Overview

[time.clock.system.overview]

```

namespace std::chrono {
    class system_clock {
        public:
            using rep          = see below;
            using period       = ratio<unspecified, unspecified>;
            using duration     = chrono::duration<rep, period>;
            using time_point   = chrono::time_point<system_clock>;
            static constexpr bool is_steady = unspecified;

            static time_point now() noexcept;

            // mapping to/from C type time_t
            static time_t      to_time_t (const time_point& t) noexcept;
            static time_point  from_time_t(time_t t) noexcept;
    };
}

```

- ¹ Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as *Unix time*. This measure facilitates an efficient mapping between `sys_time` and calendar types (29.8).

[*Example 1:*

```
sys_seconds{sys_days{1970y/January/1}}.time_since_epoch() is 0s.  
sys_seconds{sys_days{2000y/January/1}}.time_since_epoch() is 946'684'800s, which is 10'957 * 86'400s.  
— end example]
```

29.7.2.2 Members

[`time.clock.system.members`]

- ```
using system_clock::rep = unspecified;
```
- <sup>1</sup> *Constraints:* `system_clock::duration::min() < system_clock::duration::zero()` is true.
- [*Note 1:* This implies that `rep` is a signed type. — end note]
- ```
static time_t to_time_t(const time_point& t) noexcept;
```
- ² *Returns:* A `time_t` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.
- ```
static time_point from_time_t(time_t t) noexcept;
```
- <sup>3</sup> *Returns:* A `time_point` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

### 29.7.2.3 Non-member functions

[`time.clock.system.nonmembers`]

- ```
template<class charT, class traits, class Duration>  
basic_ostream<charT, traits>&  
operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);
```
- ¹ *Constraints:* `treat_as_floating_point_v<typename Duration::rep>` is false, and `Duration{1} < days{1}` is true.
- ² *Effects:* Equivalent to:
- ```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), tp);
```
- <sup>3</sup> [*Example 1:*
- ```
cout << sys_seconds{0s} << '\n';           // 1970-01-01 00:00:00  
cout << sys_seconds{946'684'800s} << '\n';   // 2000-01-01 00:00:00  
cout << sys_seconds{946'688'523s} << '\n';   // 2000-01-01 01:02:03  
— end example]
```
- ```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);
```
- <sup>4</sup> *Effects:* `os << year_month_day{dp}`.
- <sup>5</sup> *Returns:* `os`.
- ```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>  
basic_istream<charT, traits>&  
from_stream(basic_istream<charT, traits>& is, const charT* fmt,  
            sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,  
            minutes* offset = nullptr);
```
- ⁶ *Effects:* Attempts to parse the input stream `is` into the `sys_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.
- ⁷ *Returns:* `is`.

29.7.3 Class `utc_clock`

[`time.clock.utc`]

29.7.3.1 Overview

```
namespace std::chrono {
    class utc_clock {
        public:
            using rep = a signed arithmetic type;
            using period = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<utc_clock>;
            static constexpr bool is_steady = unspecified;

            static time_point now();

            template<class Duration>
            static sys_time<common_type_t<Duration, seconds>>
            to_sys(const utc_time<Duration>& t);
            template<class Duration>
            static utc_time<common_type_t<Duration, seconds>>
            from_sys(const sys_time<Duration>& t);
    };
}
```

- ¹ In contrast to `sys_time`, which does not take leap seconds into account, `utc_clock` and its associated `time_point`, `utc_time`, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

[*Note 1*: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant `sys_days{1972y/1/1} - sys_days{1970y/1/1}` (63'072'000s) from the `utc_time`. — *end note*]

[*Example 1*:

```
clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch() is 946'684'822s,
which is 10'957 * 86'400s + 22s.
— end example]
```

- ² `utc_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `utc_clock::now()` does not propagate an exception.

[*Note 2*: `noexcept(from_sys(system_clock::now()))` is false. — *end note*]

29.7.3.2 Member functions

[`time.clock.utc.members`]

```
static time_point now();
```

- ¹ Returns: `from_sys(system_clock::now())`, or a more accurate value of `utc_time`.

```
template<class Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& u);
```

- ² Returns: A `sys_time` `t`, such that `from_sys(t) == u` if such a mapping exists. Otherwise `u` represents a `time_point` during a positive leap second insertion, the conversion counts that leap second as not inserted, and the last representable value of `sys_time` prior to the insertion of the leap second is returned.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);
```

- ³ Returns: A `utc_time` `u`, such that `u.time_since_epoch() - t.time_since_epoch()` is equal to the sum of leap seconds that were inserted between `t` and 1970-01-01. If `t` is exactly the date of leap second insertion, then the conversion counts that leap second as inserted.

[*Example 1*:

```
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
```

```

u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
— end example]

```

29.7.3.3 Non-member functions

[time.clock.utc.nonmembers]

```

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);

```

1 *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 [*Example 1:*

```

auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
    cout << u << " UTC\n";

```

Produces this output:

```

2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC

```

— end example]

```

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);

```

3 *Effects:* Attempts to parse the input stream *is* into the *utc_time* *tp* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid date, *is.setstate(ios_base::failbit)* is called and *tp* is not modified. If *%Z* is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If *%z* (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to *tp*.

4 *Returns:* *is*.

```

struct leap_second_info {
    bool is_leap_second;
    seconds elapsed;
};

```

5 The type *leap_second_info* has data members and special members specified above. It has no base classes or members other than those specified.

```

template<class Duration>
leap_second_info get_leap_second_info(const utc_time<Duration>& ut);

```

6 *Returns:* A *leap_second_info* *lsi*, where *lsi.is_leap_second* is *true* if *ut* is during a positive leap second insertion, and otherwise *false*. *lsi.elapsed* is the sum of leap seconds between 1970-01-01 and *ut*. If *lsi.is_leap_second* is *true*, the leap second referred to by *ut* is included in the sum.

29.7.4 Class `tai_clock`

[`time.clock.tai`]

29.7.4.1 Overview

[`time.clock.tai.overview`]

```
namespace std::chrono {
    class tai_clock {
        public:
            using rep = a signed arithmetic type;
            using period = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<tai_clock>;
            static constexpr bool is_steady = unspecified;

            static time_point now();

            template<class Duration>
            static utc_time<common_type_t<Duration, seconds>>
            to_utc(const tai_time<Duration>&) noexcept;
            template<class Duration>
            static tai_time<common_type_t<Duration, seconds>>
            from_utc(const utc_time<Duration>&) noexcept;
    };
}
```

- ¹ The clock `tai_clock` measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).
- ² `tai_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `tai_clock::now()` does not propagate an exception.

[*Note 1: noexcept(from_utc(utc_clock::now())) is false. — end note*]

29.7.4.2 Member functions

[`time.clock.tai.members`]

`static time_point now();`

- ¹ *Returns:* `from_utc(utc_clock::now())`, or a more accurate value of `tai_time`.

```
template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const tai_time<Duration>& t) noexcept;
```

- ² *Returns:*

`utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s`

[*Note 1:*

`378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s`

— *end note*]

```
template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;
```

- ³ *Returns:*

`tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s`

[*Note 2:*

`378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s`

— *end note*]

29.7.4.3 Non-member functions

[`time.clock.tai.nonmembers`]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);
```

- 1 *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:_%F %T}"), t);
```

- 2 [Example 1:

```
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0::%F %T %Z} == {1::%F %T %Z}\n", st, tt);
```

Produces this output:

2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI

—end example]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

- Effects:** Attempts to parse the input stream `is` into the `tai_time tp` using the format flags given in the NTCTS `fmt` as specified in [29.13](#). If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

- 4 *Returns:* is.

29.7.5 Class `gps_clock`

[time.clock.gps]

29.7.5.1 Overview

[time.clock.gps.overview]

```
namespace std::chrono {
    class gps_clock {
public:
    using rep = a signed arithmetic type;
    using period = ratio<unspecified, unspecified>;
    using duration = chrono::duration<rep, period>;
    using time_point = chrono::time_point<gps_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;
    template<class Duration>
    static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
};

}
```

- ¹ The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

- ² `gps_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception.

[Note 1: `noexcept(from utc(utc_clock::now()))` is false. —end note]

29.7.5.2 Member functions

[time.clock.gps.members]

```
static time_point now();

1   Returns: from_utc(utc_clock::now()), or a more accurate value of gps_time.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
    to_utc(const gps_time<Duration>& t) noexcept;

2   Returns:
    utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s

[Note 1:
  315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
— end note]

template<class Duration>
static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;

3   Returns:
    gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s

[Note 2:
  315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
— end note]
```

29.7.5.3 Non-member functions

[time.clock.gps.nonmembers]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);

1   Effects: Equivalent to:
```

```
    return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 [Example 1:

```
    auto st = sys_days{2000y/January/1};
    auto gt = clock_cast<gps_clock>(st);
    cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

— end example]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

3 Effects: Attempts to parse the input stream is into the gps_time tp using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

4 Returns: is.

29.7.6 Type file_clock

[time.clock.file]

29.7.6.1 Overview

[time.clock.file.overview]

```
namespace std::chrono {
    using file_clock = see below;
}
```

¹ `file_clock` is an alias for a type meeting the *Cpp17TrivialClock* requirements (29.3), and using a signed arithmetic type for `file_clock::rep`. `file_clock` is used to create the `time_point` system used for `file_time_type` (31.12). Its epoch is unspecified, and `noexcept(file_clock::now())` is true.

[Note 1: The type that `file_clock` denotes can be in a different namespace than `std::chrono`, such as `std::file-system`. — end note]

29.7.6.2 Member functions

[`time.clock.file.members`]

¹ The type denoted by `file_clock` provides precisely one of the following two sets of static member functions:

```
template<class Duration>
static sys_time<see below>
    to_sys(const file_time<Duration>&);

template<class Duration>
static file_time<see below>
    from_sys(const sys_time<Duration>&);
```

or:

```
template<class Duration>
static utc_time<see below>
    to_utc(const file_time<Duration>&);

template<class Duration>
static file_time<see below>
    from_utc(const utc_time<Duration>&);
```

These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`.

29.7.6.3 Non-member functions

[`time.clock.file.nonmembers`]

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
```

¹ *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

² *Effects*: Attempts to parse the input stream `is` into the `file_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

³ *Returns*: `is`.

29.7.7 Class `steady_clock`

[`time.clock.steady`]

```
namespace std::chrono {
    class steady_clock {
        public:
            using rep      = unspecified;
            using period   = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<unspecified, duration>;
            static constexpr bool is_steady = true;

            static time_point now() noexcept;
    };
}
```

- ¹ Objects of class `steady_clock` represent clocks for which values of `time_point` never decrease as physical time advances and for which values of `time_point` advance at a steady rate relative to real time. That is, the clock may not be adjusted.

29.7.8 Class `high_resolution_clock`

[`time.clock.hires`]

```
namespace std::chrono {
    class high_resolution_clock {
        public:
            using rep      = unspecified;
            using period   = ratio<unspecified, unspecified>;
            using duration = chrono::duration<rep, period>;
            using time_point = chrono::time_point<unspecified, duration>;
            static constexpr bool is_steady = unspecified;

            static time_point now() noexcept;
        };
    }
}
```

- ¹ Objects of class `high_resolution_clock` represent clocks with the shortest tick period. `high_resolution_clock` may be a synonym for `system_clock` or `steady_clock`.

29.7.9 Local time

[`time.clock.local`]

- ¹ The family of time points denoted by `local_time<Duration>` are based on the pseudo clock `local_t`. `local_t` has no member `now()` and thus does not meet the clock requirements. Nevertheless `local_time<Duration>` serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete `time_point` algebra is available for `local_time<Duration>` (just as for `sys_time<Duration>`).

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);
2 Effects:
    os << sys_time<Duration>{lt.time_since_epoch()};
3 Returns: os.
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
```

- ⁴ Effects: Attempts to parse the input stream `is` into the `local_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

- ⁵ Returns: `is`.

29.7.10 `time_point` conversions

[`time.clock.cast`]

29.7.10.1 Class template `clock_time_conversion`

[`time.clock.conv`]

```
namespace std::chrono {
    template<class DestClock, class SourceClock>
    struct clock_time_conversion {};
}
```

- ¹ `clock_time_conversion` serves as a trait which can be used to specify how to convert a source `time_point` of type `time_point<SourceClock, Duration>` to a destination `time_point` of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified `operator()` that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock, OtherDuration>` representing an equivalent point in time. `OtherDuration` is a `chrono::duration` whose

specialization is computed from the input `Duration` in a manner which can vary for each `clock_time_conversion` specialization. A program may specialize `clock_time_conversion` if at least one of the template parameters is a user-defined clock type.

- 2 Several specializations are provided by the implementation, as described in [29.7.10.2](#), [29.7.10.3](#), [29.7.10.4](#), and [29.7.10.5](#).

29.7.10.2 Identity conversions

[`time.clock.cast.id`]

```
template<class Clock>
struct clock_time_conversion<Clock, Clock> {
    template<class Duration>
        time_point<Clock, Duration>
            operator()(const time_point<Clock, Duration>& t) const;
};

template<class Duration>
time_point<Clock, Duration>
operator()(const time_point<Clock, Duration>& t) const;

1   Returns: t.

template<>
struct clock_time_conversion<system_clock, system_clock> {
    template<class Duration>
        sys_time<Duration>
            operator()(const sys_time<Duration>& t) const;
};

template<class Duration>
sys_time<Duration>
operator()(const sys_time<Duration>& t) const;

2   Returns: t.

template<>
struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
        utc_time<Duration>
            operator()(const utc_time<Duration>& t) const;
};

template<class Duration>
utc_time<Duration>
operator()(const utc_time<Duration>& t) const;

3   Returns: t.
```

29.7.10.3 Conversions between `system_clock` and `utc_clock`

[`time.clock.cast.sys.utc`]

```
template<>
struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
        utc_time<common_type_t<Duration, seconds>>
            operator()(const sys_time<Duration>& t) const;
};

template<class Duration>
utc_time<common_type_t<Duration, seconds>>
operator()(const sys_time<Duration>& t) const;

1   Returns: utc_clock::from_sys(t).

template<>
struct clock_time_conversion<system_clock, utc_clock> {
    template<class Duration>
        sys_time<common_type_t<Duration, seconds>>
            operator()(const utc_time<Duration>& t) const;
};

```

```

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
operator()(const utc_time<Duration>& t) const;
2   Returns: utc_clock::to_sys(t).

```

29.7.10.4 Conversions between system_clock and other clocks

[time.clock.cast.sys]

```

template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_sys(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));

1   Constraints: SourceClock::to_sys(t) is well-formed.
2   Mandates: SourceClock::to_sys(t) returns a sys_time<Duration2> for some type Duration2
(29.6.1).
3   Returns: SourceClock::to_sys(t).

template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
    auto operator()(const sys_time<Duration>& t) const
        -> decltype(DestClock::from_sys(t));
};

template<class Duration>
auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));

4   Constraints: DestClock::from_sys(t) is well-formed.
5   Mandates: DestClock::from_sys(t) returns a time_point<DestClock, Duration2> for some type
Duration2 (29.6.1).
6   Returns: DestClock::from_sys(t).

```

29.7.10.5 Conversions between utc_clock and other clocks

[time.clock.cast.utc]

```

template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_utc(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));

1   Constraints: SourceClock::to_utc(t) is well-formed.
2   Mandates: SourceClock::to_utc(t) returns a utc_time<Duration2> for some type Duration2
(29.6.1).
3   Returns: SourceClock::to_utc(t).

template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
        -> decltype(DestClock::from_utc(t));
};

```

```
template<class Duration>
auto operator()(const utc_time<Duration>& t) const
-> decltype(DestClock::from_utc(t));

4   Constraints: DestClock::from_utc(t) is well-formed.

5   Mandates: DestClock::from_utc(t) returns a time_point<DestClock, Duration2> for some type
Duration2 (29.6.1).

6   Returns: DestClock::from_utc(t).
```

29.7.10.6 Function template `clock_cast`

[time.clock.cast.fn]

```
template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);

1   Constraints: At least one of the following clock time conversion expressions is well-formed:
(1.1)    — clock_time_conversion<DestClock, SourceClock>{}(t)
(1.2)    — clock_time_conversion<DestClock, system_clock>{}(
           clock_time_conversion<system_clock, SourceClock>{}(t))
(1.3)    — clock_time_conversion<DestClock, utc_clock>{}(
           clock_time_conversion<utc_clock, SourceClock>{}(t))
(1.4)    — clock_time_conversion<DestClock, utc_clock>{}(
           clock_time_conversion<utc_clock, system_clock>{}(
               clock_time_conversion<system_clock, SourceClock>{}(t)))
(1.5)    — clock_time_conversion<DestClock, system_clock>{}(
           clock_time_conversion<system_clock, utc_clock>{}(
               clock_time_conversion<utc_clock, SourceClock>{}(t)))
```

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations.

- 2 *Mandates:* Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.
- 3 *Returns:* The best well-formed clock time conversion expression in the above list.

29.8 The civil calendar

[time.cal]

29.8.1 In general

[time.cal.general]

- 1 The types in 29.8 describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.

29.8.2 Class `last_spec`

[time.cal.last]

```
namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}
```

- 1 The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

29.8.3 Class `day`

[time.cal.day]

29.8.3.1 Overview

[time.cal.day.overview]

```
namespace std::chrono {
    class day {
        unsigned char d_;           // exposition only
    public:
        day() = default;
        constexpr explicit day(unsigned d) noexcept;
```

```

    constexpr day& operator++()      noexcept;
    constexpr day  operator++(int)   noexcept;
    constexpr day& operator--()      noexcept;
    constexpr day  operator--(int)   noexcept;

    constexpr day& operator+=(const days& d) noexcept;
    constexpr day& operator-=(const days& d) noexcept;

    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

- ¹ day represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into day's unspecified internal storage. day meets the *Cpp17EqualityComparable* ([Table 28](#)) and *Cpp17LessThanComparable* ([Table 29](#)) requirements, and participates in basic arithmetic with days objects, which represent a difference between two day objects.

- ² day is a trivially copyable and standard-layout class type.

29.8.3.2 Member functions

[time.cal.day.members]

```
constexpr explicit day(unsigned d) noexcept;
```

- ¹ *Effects:* Initializes `d_` with `d`. The value held is unspecified if `d` is not in the range [0, 255].

```
constexpr day& operator++() noexcept;
```

- ² *Effects:* `++d_`.

- ³ *Returns:* `*this`.

```
constexpr day operator++(int) noexcept;
```

- ⁴ *Effects:* `++(*this)`.

- ⁵ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator--() noexcept;
```

- ⁶ *Effects:* Equivalent to: `--d_`.

- ⁷ *Returns:* `*this`.

```
constexpr day operator--(int) noexcept;
```

- ⁸ *Effects:* `--(*this)`.

- ⁹ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr day& operator+=(const days& d) noexcept;
```

- ¹⁰ *Effects:* `*this = *this + d`.

- ¹¹ *Returns:* `*this`.

```
constexpr day& operator-=(const days& d) noexcept;
```

- ¹² *Effects:* `*this = *this - d`.

- ¹³ *Returns:* `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

- ¹⁴ *Returns:* `d_`.

```
constexpr bool ok() const noexcept;
```

- ¹⁵ *Returns:* `1 <= d_ && d_ <= 31`.

29.8.3.3 Non-member functions

[time.cal.day.nonmembers]

```

constexpr bool operator==(const day& x, const day& y) noexcept;
1   Returns: unsigned{x} == unsigned{y}.

constexpr strong_ordering operator<=(const day& x, const day& y) noexcept;
2   Returns: unsigned{x} <= unsigned{y}.

constexpr day operator+(const day& x, const days& y) noexcept;
3   Returns: day(unsigned{x} + y.count()).

constexpr day operator+(const days& x, const day& y) noexcept;
4   Returns: y + x.

constexpr day operator-(const day& x, const days& y) noexcept;
5   Returns: x + -y.

constexpr days operator-(const day& x, const day& y) noexcept;
6   Returns: days{int(unsigned{x}) - int(unsigned{y})}.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const day& d);

7   Effects: Equivalent to:
    return os << (d.ok() ?
        format(STATICALLY-WIDEN<charT>("{:%d}"), d) :
        format(STATICALLY-WIDEN<charT>("{:%d} is not a valid day"), d));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);

8   Effects: Attempts to parse the input stream is into the day d using the format flags given in the NTCTS
fmt as specified in 29.13. If the parse fails to decode a valid day, is.setstate(ios_base::failbit)
is called and d is not modified. If %Z is used and successfully parsed, that value will be assigned to
*abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value
will be assigned to *offset if offset is non-null.

9   Returns: is.

constexpr chrono::day operator""d(unsigned long long d) noexcept;
10  Returns: day{static_cast<unsigned>(d)}.

```

29.8.4 Class month

[time.cal.month]

29.8.4.1 Overview

[time.cal.month.overview]

```

namespace std::chrono {
    class month {
        unsigned char m_;           // exposition only
    public:
        month() = default;
        constexpr explicit month(unsigned m) noexcept;

        constexpr month& operator++()      noexcept;
        constexpr month operator++(int) noexcept;
        constexpr month& operator--()      noexcept;
        constexpr month operator--(int) noexcept;

        constexpr month& operator+=(const months& m) noexcept;
        constexpr month& operator-=(const months& m) noexcept;
    };
}
```

```

    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

- ¹ month represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into month's unspecified internal storage. month meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with months objects, which represent a difference between two month objects.

- ² month is a trivially copyable and standard-layout class type.

29.8.4.2 Member functions

[time.cal.month.members]

```
constexpr explicit month(unsigned m) noexcept;
```

- ¹ *Effects*: Initializes `m_` with `m`. The value held is unspecified if `m` is not in the range [0, 255].

```
constexpr month& operator++() noexcept;
```

- ² *Effects*: `*this += months{1}`.

- Returns*: `*this`.

```
constexpr month operator++(int) noexcept;
```

- ⁴ *Effects*: `++(*this)`.

- Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator--() noexcept;
```

- ⁶ *Effects*: `*this -= months{1}`.

- Returns*: `*this`.

```
constexpr month operator--(int) noexcept;
```

- ⁸ *Effects*: `--(*this)`.

- Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator+=(const months& m) noexcept;
```

- ¹⁰ *Effects*: `*this = *this + m`.

- Returns*: `*this`.

```
constexpr month& operator-=(const months& m) noexcept;
```

- ¹² *Effects*: `*this = *this - m`.

- Returns*: `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

- ¹⁴ *Returns*: `m_`.

```
constexpr bool ok() const noexcept;
```

- ¹⁵ *Returns*: `1 <= m_ && m_ <= 12`.

29.8.4.3 Non-member functions

[time.cal.month.nonmembers]

```
constexpr bool operator==(const month& x, const month& y) noexcept;
```

- ¹ *Returns*: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=(const month& x, const month& y) noexcept;
```

- ² *Returns*: `unsigned{x} <= unsigned{y}`.

```
constexpr month operator+(const month& x, const months& y) noexcept;
```

- ³ *Returns*:

```
month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
```

where `modulo(n, 12)` computes the remainder of `n` divided by 12 using Euclidean division.

[*Note 1:* Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 11]. Assuming no overflow in the signed summation, this operation results in a `month` holding a value in the range [1, 12] even if `!x.ok()`. — *end note*]

[*Example 1:* `February + months{11} == January`. — *end example*]

```
constexpr month operator+(const months& x, const month& y) noexcept;
```

4 *Returns:* `y + x`.

```
constexpr month operator-(const month& x, const months& y) noexcept;
```

5 *Returns:* `x + -y`.

```
constexpr months operator-(const month& x, const month& y) noexcept;
```

6 *Returns:* If `x.ok() == true` and `y.ok() == true`, returns a value `m` in the range [`months{0}`, `months{11}`] satisfying `y + m == x`. Otherwise the value returned is unspecified.

[*Example 2:* `January - February == months{11}`. — *end example*]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month& m);
```

7 *Effects:* Equivalent to:

```
return os << (m.ok() ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%b}"), m) :
    format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
        static_cast<unsigned>(m)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
```

```
month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

8 *Effects:* Attempts to parse the input stream `is` into the `month m` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid month, `is.setstate(ios_base::failbit)` is called and `m` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns:* `is`.

29.8.5 Class year

[time.cal.year]

29.8.5.1 Overview

[time.cal.year.overview]

```
namespace std::chrono {
    class year {
        short y_; // exposition only
    public:
        year() = default;
        constexpr explicit year(int y) noexcept;

        constexpr year& operator++() noexcept;
        constexpr year operator++(int) noexcept;
        constexpr year& operator--() noexcept;
        constexpr year operator--(int) noexcept;

        constexpr year& operator+=(const years& y) noexcept;
        constexpr year& operator-=(const years& y) noexcept;

        constexpr year operator+() const noexcept;
        constexpr year operator-() const noexcept;

        constexpr bool is_leap() const noexcept;
```

```

    constexpr explicit operator int() const noexcept;
    constexpr bool ok() const noexcept;

    static constexpr year min() noexcept;
    static constexpr year max() noexcept;
};

}

```

¹ `year` represents a year in the civil calendar. It can represent values in the range [`min()`,`max()`]. It can be constructed with any `int` value, which will be subsequently truncated to fit into `year`'s unspecified internal storage. `year` meets the *Cpp17EqualityComparable* ([Table 28](#)) and *Cpp17LessThanComparable* ([Table 29](#)) requirements, and participates in basic arithmetic with `years` objects, which represent a difference between two `year` objects.

² `year` is a trivially copyable and standard-layout class type.

29.8.5.2 Member functions

[time.cal.year.members]

```
constexpr explicit year(int y) noexcept;
```

¹ *Effects:* Initializes `y_` with `y`. The value held is unspecified if `y` is not in the range [-32767, 32767].

```
constexpr year& operator++() noexcept;
```

² *Effects:* `++y_`.

³ *Returns:* `*this`.

```
constexpr year operator++(int) noexcept;
```

⁴ *Effects:* `++(*this)`.

⁵ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator--() noexcept;
```

⁶ *Effects:* `--y_`.

⁷ *Returns:* `*this`.

```
constexpr year operator--(int) noexcept;
```

⁸ *Effects:* `--(*this)`.

⁹ *Returns:* A copy of `*this` as it existed on entry to this member function.

```
constexpr year& operator+=(const years& y) noexcept;
```

¹⁰ *Effects:* `*this = *this + y`.

¹¹ *Returns:* `*this`.

```
constexpr year& operator-=(const years& y) noexcept;
```

¹² *Effects:* `*this = *this - y`.

¹³ *Returns:* `*this`.

```
constexpr year operator+() const noexcept;
```

¹⁴ *Returns:* `*this`.

```
constexpr year operator-() const noexcept;
```

¹⁵ *Returns:* `year{-y_}`.

```
constexpr bool is_leap() const noexcept;
```

¹⁶ *Returns:* `y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0)`.

```
constexpr explicit operator int() const noexcept;
```

¹⁷ *Returns:* `y_`.

```
constexpr bool ok() const noexcept;
```

¹⁸ *Returns:* `min().y_ <= y_ && y_ <= max().y_`.

```

static constexpr year min() noexcept;
19   Returns: year{-32767}.

static constexpr year max() noexcept;
20   Returns: year{32767}.

```

29.8.5.3 Non-member functions

[time.cal.year.nonmembers]

```

constexpr bool operator==(const year& x, const year& y) noexcept;
1   Returns: int{x} == int{y}.

constexpr strong_ordering operator<=(const year& x, const year& y) noexcept;
2   Returns: int{x} <= int{y}.

constexpr year operator+(const year& x, const years& y) noexcept;
3   Returns: year{int{x} + static_cast<int>(y.count())}.

constexpr year operator+(const years& x, const year& y) noexcept;
4   Returns: y + x.

constexpr year operator-(const year& x, const years& y) noexcept;
5   Returns: x + -y.

constexpr years operator-(const year& x, const year& y) noexcept;
6   Returns: years{int{x} - int{y}}.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year& y);
7   Effects: Equivalent to:
    return os << (y.ok() ?
        format(STATICALLY-WIDEN<charT>("{:%Y}"), y) :
        format(STATICALLY-WIDEN<charT>("{:%Y} is not a valid year"), y));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
8   Effects: Attempts to parse the input stream is into the year y using the format flags given in the NTCTS
fmt as specified in 29.13. If the parse fails to decode a valid year, is.setstate(ios_base::failbit)
is called and y is not modified. If %Z is used and successfully parsed, that value will be assigned to
*abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value
will be assigned to *offset if offset is non-null.

9   Returns: is.

constexpr chrono::year operator""y(unsigned long long y) noexcept;
10  Returns: year{static_cast<int>(y)}.

```

29.8.6 Class weekday

[time.cal.wd]

29.8.6.1 Overview

[time.cal.wd.overview]

```

namespace std::chrono {
    class weekday {
        unsigned char wd_;           // exposition only
    public:
        weekday() = default;
        constexpr explicit weekday(unsigned wd) noexcept;
        constexpr weekday(const sys_days& dp) noexcept;
        constexpr explicit weekday(const local_days& dp) noexcept;

```

```

    constexpr weekday& operator++()      noexcept;
    constexpr weekday  operator++(int)  noexcept;
    constexpr weekday& operator--()      noexcept;
    constexpr weekday  operator--(int)  noexcept;

    constexpr weekday& operator+=(const days& d) noexcept;
    constexpr weekday& operator-=(const days& d) noexcept;

    constexpr unsigned c_encoding() const noexcept;
    constexpr unsigned iso_encoding() const noexcept;
    constexpr bool ok() const noexcept;

    constexpr weekday_indexed operator[](unsigned index) const noexcept;
    constexpr weekday_last   operator[](last_spec) const noexcept;
};

}

```

- ¹ `weekday` represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `weekday`'s unspecified internal storage. `weekday` meets the *Cpp17EqualityComparable* (Table 28) requirements.

[*Note 1:* `weekday` is not *Cpp17LessThanComparable* because there is no universal consensus on which day is the first day of the week. `weekday`'s arithmetic operations treat the days of the week as a circular range, with no beginning and no end. — *end note*]

- ² `weekday` is a trivially copyable and standard-layout class type.

29.8.6.2 Member functions

[time.cal.wd.members]

```

constexpr explicit weekday(unsigned wd) noexcept;

1   Effects: Initializes wd_ with wd == 7 ? 0 : wd. The value held is unspecified if wd is not in the range [0, 255].

constexpr weekday(const sys_days& dp) noexcept;

2   Effects: Computes what day of the week corresponds to the sys_days dp, and initializes that day of the week in wd_.

3   [Example 1: If dp represents 1970-01-01, the constructed weekday represents Thursday by storing 4 in wd_. — end example]

constexpr explicit weekday(const local_days& dp) noexcept;

4   Effects: Computes what day of the week corresponds to the local_days dp, and initializes that day of the week in wd_.

5   Postconditions: The value is identical to that constructed from sys_days{dp.time_since_epoch()}.

constexpr weekday& operator++() noexcept;

6   Effects: *this += days{1}.

7   Returns: *this.

constexpr weekday operator++(int) noexcept;

8   Effects: ++(*this).

9   Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator--() noexcept;

10  Effects: *this -= days{1}.

11  Returns: *this.

constexpr weekday operator--(int) noexcept;

12  Effects: --(*this).

13  Returns: A copy of *this as it existed on entry to this member function.

```

```

constexpr weekday& operator+=(const days& d) noexcept;
14   Effects: *this = *this + d.
15   Returns: *this.

constexpr weekday& operator-=(const days& d) noexcept;
16   Effects: *this = *this - d.
17   Returns: *this.

constexpr unsigned c_encoding() const noexcept;
18   Returns: wd_.

constexpr unsigned iso_encoding() const noexcept;
19   Returns: wd_ == 0u ? 7u : wd_.

constexpr bool ok() const noexcept;
20   Returns: wd_ <= 6.

constexpr weekday_indexed operator[](unsigned index) const noexcept;
21   Returns: {*this, index}.

constexpr weekday_last operator[](last_spec) const noexcept;
22   Returns: weekday_last{*this}.

```

29.8.6.3 Non-member functions

[time.cal.wd.nonmembers]

```
constexpr bool operator==(const weekday& x, const weekday& y) noexcept;
```

1 Returns: x.wd_ == y.wd_.

```
constexpr weekday operator+(const weekday& x, const days& y) noexcept;
```

2 Returns:

```
    weekday{modulo(static_cast<long long>(x.wd_) + y.count(), 7)}
```

where modulo(n, 7) computes the remainder of n divided by 7 using Euclidean division.

[Note 1: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0,6]. Assuming no overflow in the signed summation, this operation results in a weekday holding a value in the range [0,6] even if !x.ok(). — end note]

[Example 1: Monday + days{6} == Sunday. — end example]

```
constexpr weekday operator+(const days& x, const weekday& y) noexcept;
```

3 Returns: y + x.

```
constexpr weekday operator-(const weekday& x, const days& y) noexcept;
```

4 Returns: x + -y.

```
constexpr days operator-(const weekday& x, const weekday& y) noexcept;
```

5 Returns: If x.ok() == true and y.ok() == true, returns a value d in the range [days{0},days{6}] satisfying y + d == x. Otherwise the value returned is unspecified.

[Example 2: Sunday - Monday == days{6}. — end example]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday& wd);
```

6 Effects: Equivalent to:

```

return os << (wd.ok() ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%a}"), wd) :
    format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid weekday"),
           static_cast<unsigned>(wd.wd_)));

```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

⁷ *Effects:* Attempts to parse the input stream *is* into the *weekday* *wd* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid weekday, *is.setstate(ios_base::failbit)* is called and *wd* is not modified. If %Z is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null.

⁸ *Returns:* *is*.

29.8.7 Class `weekday_indexed`

[time.cal.wdidx]

29.8.7.1 Overview

[time.cal.wdidx.overview]

```
namespace std::chrono {
class weekday_indexed {
    chrono::weekday wd_;           // exposition only
    unsigned char index_;          // exposition only

public:
    weekday_indexed() = default;
    constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned index() const noexcept;
    constexpr bool ok() const noexcept;
};
```

¹ *weekday_indexed* represents a *weekday* and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

² [Note 1: A *weekday_indexed* object can be constructed by indexing a *weekday* with an *unsigned*. — end note]

[Example 1:

```
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
— end example]
```

³ *weekday_indexed* is a trivially copyable and standard-layout class type.

29.8.7.2 Member functions

[time.cal.wdidx.members]

```
constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
```

¹ *Effects:* Initializes *wd_* with *wd* and *index_* with *index*. The values held are unspecified if !*wd.ok()* or *index* is not in the range [0, 7].

```
constexpr chrono::weekday weekday() const noexcept;
```

² *Returns:* *wd_*.

```
constexpr unsigned index() const noexcept;
```

³ *Returns:* *index_*.

```
constexpr bool ok() const noexcept;
```

⁴ *Returns:* *wd_.ok() && 1 <= index_ && index_ <= 5.*

29.8.7.3 Non-member functions

[time.cal.wdidx.nonmembers]

```
constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
```

¹ *Returns:* *x.weekday() == y.weekday() && x.index() == y.index()*.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
```

2 *Effects:* Equivalent to:

```
auto i = wdi.index();
return os << (i >= 1 && i <= 5 ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{}]", wdi.weekday(), i) :
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{} is not a valid index]", wdi.weekday(), i));
```

29.8.8 Class weekday_last

[time.cal.wdlast]

29.8.8.1 Overview

[time.cal.wdlast.overview]

```
namespace std::chrono {
    class weekday_last {
        chrono::weekday wd_; // exposition only

    public:
        constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

        constexpr chrono::weekday weekday() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

1 `weekday_last` represents the last weekday of a month.

2 [Note 1: A `weekday_last` object can be constructed by indexing a `weekday` with `last`. — end note]

[Example 1:

```
constexpr auto wdl = Sunday[last]; // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
— end example]
```

3 `weekday_last` is a trivially copyable and standard-layout class type.

29.8.8.2 Member functions

[time.cal.wdlast.members]

```
constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

1 *Effects:* Initializes `wd_` with `wd`.

```
constexpr chrono::weekday weekday() const noexcept;
```

2 *Returns:* `wd_`.

```
constexpr bool ok() const noexcept;
```

3 *Returns:* `wd_.ok()`.

29.8.8.3 Non-member functions

[time.cal.wdlast.nonmembers]

```
constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

1 *Returns:* `x.weekday() == y.weekday()`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);
```

2 *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[last]", wdl.weekday()));
```

29.8.9 Class month_day

[time.cal.md]

29.8.9.1 Overview

[time.cal.md.overview]

```
namespace std::chrono {
    class month_day {
        chrono::month m_; // exposition only
```

```

    chrono::day d_;           // exposition only

public:
    month_day() = default;
    constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr chrono::day day() const noexcept;
    constexpr bool ok() const noexcept;
};

}

```

¹ `month_day` represents a specific day of a specific month, but with an unspecified year. `month_day` meets the *Cpp17EqualityComparable* ([Table 28](#)) and *Cpp17LessThanComparable* ([Table 29](#)) requirements.

² `month_day` is a trivially copyable and standard-layout class type.

29.8.9.2 Member functions

[time.cal.md.members]

```
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

¹ *Effects:* Initializes `m_` with `m`, and `d_` with `d`.

```
constexpr chrono::month month() const noexcept;
```

² *Returns:* `m_`.

```
constexpr chrono::day day() const noexcept;
```

³ *Returns:* `d_`.

```
constexpr bool ok() const noexcept;
```

⁴ *Returns:* `true` if `m_.ok()` is `true`, `1d <= d_`, and `d_` is less than or equal to the number of days in month `m_`; otherwise returns `false`. When `m_ == February`, the number of days is considered to be 29.

29.8.9.3 Non-member functions

[time.cal.md.nonmembers]

```
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
```

¹ *Returns:* `x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=(const month_day& x, const month_day& y) noexcept;
```

² *Effects:* Equivalent to:

```
if (auto c = x.month() <= y.month(); c != 0) return c;
return x.day() <= y.day();
```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day& md);
```

³ *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{:L}/{})", 
md.month(), md.day());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

⁴ *Effects:* Attempts to parse the input stream `is` into the `month_day` `md` using the format flags given in the NTCTS `fmt` as specified in [29.13](#). If the parse fails to decode a valid `month_day`, `is.setstate(ios_base::failbit)` is called and `md` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

⁵ *Returns:* `is`.

29.8.10 Class month_day_last

[time.cal.mdlst]

```
namespace std::chrono {
    class month_day_last {
        chrono::month m_;           // exposition only
    public:
        constexpr explicit month_day_last(const chrono::month& m) noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

¹ month_day_last represents the last day of a month.

² [Note 1: A month_day_last object can be constructed using the expression m/last or last/m, where m is an expression of type month. — end note]

[Example 1:

```
constexpr auto mdl = February/last;      // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
— end example]
```

³ month_day_last is a trivially copyable and standard-layout class type.

constexpr explicit month_day_last(const chrono::month& m) noexcept;

⁴ Effects: Initializes m_ with m.

constexpr month month() const noexcept;

⁵ Returns: m_.

constexpr bool ok() const noexcept;

⁶ Returns: m_.ok().

constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;

⁷ Returns: x.month() == y.month().

constexpr strong_ordering operator<=(const month_day_last& x, const month_day_last& y) noexcept;

⁸ Returns: x.month() <= y.month().

template<class charT, class traits>

```
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);
```

⁹ Effects: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/last"), mdl.month());
```

29.8.11 Class month_weekday

[time.cal.mwd]

29.8.11.1 Overview

[time.cal.mwd.overview]

```
namespace std::chrono {
    class month_weekday {
        chrono::month          m_;           // exposition only
        chrono::weekday_indexed wdi_;         // exposition only
    public:
        constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
        constexpr chrono::month          month()          const noexcept;
        constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

¹ month_weekday represents the n^{th} weekday of a month, of an as yet unspecified year. To do this the month_weekday stores a month and a weekday_indexed.

² [Example 1:

```
constexpr auto mwd
    = February/Tuesday[3];           // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
— end example]
```

³ month_weekday is a trivially copyable and standard-layout class type.

29.8.11.2 Member functions

[time.cal.mwd.members]

```
constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
```

¹ Effects: Initializes m_ with m, and wdi_ with wdi.

```
constexpr chrono::month month() const noexcept;
```

² Returns: m_.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

³ Returns: wdi_.

```
constexpr bool ok() const noexcept;
```

⁴ Returns: m_.ok() && wdi_.ok().

29.8.11.3 Non-member functions

[time.cal.mwd.nonmembers]

```
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
```

¹ Returns: x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed().

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
```

² Effects: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
mwd.month(), mwd.weekday_indexed());
```

29.8.12 Class month_weekday_last

[time.cal.mwdlast]

29.8.12.1 Overview

[time.cal.mwdlast.overview]

```
namespace std::chrono {
class month_weekday_last {
    chrono::month      m_;      // exposition only
    chrono::weekday_last wdl_;  // exposition only
public:
    constexpr month_weekday_last(const chrono::month& m,
                                const chrono::weekday_last& wdl) noexcept;

    constexpr chrono::month      month()      const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;
    constexpr bool ok() const noexcept;
};
```

¹ month_weekday_last represents the last weekday of a month, of an as yet unspecified year. To do this the month_weekday_last stores a month and a weekday_last.

² [Example 1:

```
constexpr auto mwd
    = February/Tuesday[last]; // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_last() == Tuesday[last]);
— end example]
```

³ month_weekday_last is a trivially copyable and standard-layout class type.

29.8.12.2 Member functions

[time.cal.mwdlast.members]

```
constexpr month_weekday_last(const chrono::month& m,
                           const chrono::weekday_last& wdl) noexcept;
```

¹ *Effects:* Initializes `m_` with `m`, and `wdl_` with `wdl`.

```
constexpr chrono::month month() const noexcept;
```

² *Returns:* `m_`.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

³ *Returns:* `wdl_`.

```
constexpr bool ok() const noexcept;
```

⁴ *Returns:* `m_.ok() && wdl_.ok()`.

29.8.12.3 Non-member functions

[time.cal.mwdlast.nonmembers]

```
constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;
```

¹ *Returns:* `x.month() == y.month() && x.weekday_last() == y.weekday_last()`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);
```

² *Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
                      mwdl.month(), mwdl.weekday_last());
```

29.8.13 Class year_month

[time.cal.ym]

29.8.13.1 Overview

[time.cal.ym.overview]

```
namespace std::chrono {
class year_month {
    chrono::year y_;           // exposition only
    chrono::month m_;          // exposition only

public:
    year_month() = default;
    constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;

    constexpr year_month& operator+=(const months& dm) noexcept;
    constexpr year_month& operator-=(const months& dm) noexcept;
    constexpr year_month& operator+=(const years& dy) noexcept;
    constexpr year_month& operator-=(const years& dy) noexcept;

    constexpr bool ok() const noexcept;
};

}
```

¹ `year_month` represents a specific month of a specific year, but with an unspecified day. `year_month` is a field-based time point with a resolution of `months`. `year_month` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

² `year_month` is a trivially copyable and standard-layout class type.

29.8.13.2 Member functions

[time.cal.ym.members]

```
constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
```

¹ *Effects:* Initializes `y_` with `y`, and `m_` with `m`.

```

constexpr chrono::year year() const noexcept;
2   Returns: y_.

constexpr chrono::month month() const noexcept;
3   Returns: m_.

constexpr year_month& operator+=(const months& dm) noexcept;
4   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
5   Effects: *this = *this + dm.
6   Returns: *this.

constexpr year_month& operator-=(const months& dm) noexcept;
7   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
8   Effects: *this = *this - dm.
9   Returns: *this.

constexpr year_month& operator+=(const years& dy) noexcept;
10  Effects: *this = *this + dy.
11  Returns: *this.

constexpr year_month& operator-=(const years& dy) noexcept;
12  Effects: *this = *this - dy.
13  Returns: *this.

constexpr bool ok() const noexcept;
14  Returns: y_.ok() && m_.ok().

```

29.8.13.3 Non-member functions

[time.cal.ym.nonmembers]

```

constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
1   Returns: x.year() == y.year() && x.month() == y.month().

constexpr strong_ordering operator<=(const year_month& x, const year_month& y) noexcept;
2   Effects: Equivalent to:
      if (auto c = x.year() <= y.year(); c != 0) return c;
      return x.month() <= y.month();

constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;
3   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
4   Returns: A year_month value z such that z.ok() && z - ym == dm is true.
5   Complexity:  $\mathcal{O}(1)$  with respect to the value of dm.

constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;
6   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
7   Returns: ym + dm.

constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;
8   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
9   Returns: ym + -dm.

```

```

constexpr months operator-(const year_month& x, const year_month& y) noexcept;
10   Returns:
        x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
                                         static_cast<int>(unsigned{y.month()})}

constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;
11   Returns: (ym.year() + dy) / ym.month().

constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;
12   Returns: ym + dy.

constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;
13   Returns: ym + -dy.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month& ym);

14   Effects: Equivalent to:
        return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{}/{:L}"),
                               ym.year(), ym.month());

```

```

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);

```

15 Effects: Attempts to parse the input stream *is* into the *year_month* *ym* using the format flags given in the NTCTS *fmt* as specified in 29.13. If the parse fails to decode a valid *year_month*, *is.setstate(ios_base::failbit)* is called and *ym* is not modified. If %Z is used and successfully parsed, that value will be assigned to **abbrev* if *abbrev* is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to **offset* if *offset* is non-null.

16 Returns: *is*.

29.8.14 Class year_month_day

[time.cal.ymd]

29.8.14.1 Overview

[time.cal.ymd.overview]

```

namespace std::chrono {
    class year_month_day {
        chrono::year y_;           // exposition only
        chrono::month m_;          // exposition only
        chrono::day d_;            // exposition only

    public:
        year_month_day() = default;
        constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                               const chrono::day& d) noexcept;
        constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
        constexpr year_month_day(const sys_days& dp) noexcept;
        constexpr explicit year_month_day(const local_days& dp) noexcept;

        constexpr year_month_day& operator+=(const months& m) noexcept;
        constexpr year_month_day& operator-=(const months& m) noexcept;
        constexpr year_month_day& operator+=(const years& y) noexcept;
        constexpr year_month_day& operator-=(const years& y) noexcept;

        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;

        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
    };
}

```

```
    constexpr bool ok() const noexcept;
};

}
```

- ¹ `year_month_day` represents a specific year, month, and day. `year_month_day` is a field-based time point with a resolution of days.

[*Note 1:* `year_month_day` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_day` meets the *Cpp17EqualityComparable* ([Table 28](#)) and *Cpp17LessThanComparable* ([Table 29](#)) requirements.

- ² `year_month_day` is a trivially copyable and standard-layout class type.

29.8.14.2 Member functions

[`time.cal.ymd.members`]

```
constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                        const chrono::day& d) noexcept;
```

- ¹ *Effects:* Initializes `y_` with `y`, `m_` with `m`, and `d_` with `d`.

```
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
```

- ² *Effects:* Initializes `y_` with `ymdl.year()`, `m_` with `ymdl.month()`, and `d_` with `ymdl.day()`.

[*Note 1:* This conversion from `year_month_day_last` to `year_month_day` can be more efficient than converting a `year_month_day_last` to a `sys_days`, and then converting that `sys_days` to a `year_month_day`. — *end note*]

```
constexpr year_month_day(const sys_days& dp) noexcept;
```

- ³ *Effects:* Constructs an object of type `year_month_day` that corresponds to the date represented by `dp`.

- ⁴ *Remarks:* For any value `ymd` of type `year_month_day` for which `ymd.ok()` is `true`, `ymd == year_month_day{sys_days{ymd}}` is `true`.

```
constexpr explicit year_month_day(const local_days& dp) noexcept;
```

- ⁵ *Effects:* Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_day& operator+=(const months& m) noexcept;
```

- ⁶ *Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` ([12.2.4.3](#)).

- ⁷ *Effects:* `*this = *this + m`.

- ⁸ *Returns:* `*this`.

```
constexpr year_month_day& operator-=(const months& m) noexcept;
```

- ⁹ *Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` ([12.2.4.3](#)).

- ¹⁰ *Effects:* `*this = *this - m`.

- ¹¹ *Returns:* `*this`.

```
constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
```

- ¹² *Effects:* `*this = *this + y`.

- ¹³ *Returns:* `*this`.

```
constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
```

- ¹⁴ *Effects:* `*this = *this - y`.

- ¹⁵ *Returns:* `*this`.

```
constexpr chrono::year year() const noexcept;
```

- ¹⁶ *Returns:* `y_`.

```
constexpr chrono::month month() const noexcept;
```

- ¹⁷ *Returns:* `m_`.

```

constexpr chrono::day day() const noexcept;
18   Returns: d_.

constexpr operator sys_days() const noexcept;
19   Returns: If ok(), returns a sys_days holding a count of days from the sys_days epoch to *this
(a negative value if *this represents a date prior to the sys_days epoch). Otherwise, if y_.ok()
&& m_.ok() is true, returns sys_days{y_/m_/1d} + (d_ - 1d). Otherwise the value returned is
unspecified.

20   Remarks: A sys_days in the range [days{-12687428},days{11248737}] which is converted to a
year_month_day has the same value when converted back to a sys_days.

21   [Example 1:
    static_assert(year_month_day{sys_days{2017y/January/0}} == 2016y/December/31);
    static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
    static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
— end example]

constexpr explicit operator local_days() const noexcept;
22   Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
23   Returns: If y_.ok() is true, and m_.ok() is true, and d_ is in the range [1d,(y_/m_/last).day()],
then returns true; otherwise returns false.

```

29.8.14.3 Non-member functions

[time.cal.ymd.nonmembers]

```

constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
1   Returns: x.year() == y.year() && x.month() == y.month() && x.day() == y.day().

constexpr strong_ordering operator<=(const year_month_day& x, const year_month_day& y) noexcept;
2   Effects: Equivalent to:
    if (auto c = x.year() <= y.year(); c != 0) return c;
    if (auto c = x.month() <= y.month(); c != 0) return c;
    return x.day() <= y.day();

constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;
3   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
4   Returns: (ymd.year() / ymd.month() + dm) / ymd.day().
5   [Note 1: If ymd.day() is in the range [1d,28d], ok() will return true for the resultant year_month_day. — end
note]

constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;
6   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
7   Returns: ymd + dm.

constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;
8   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
9   Returns: ymd + (-dm).

constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;
10  Returns: (ymd.year() + dy) / ymd.month() / ymd.day().

11  [Note 2: If ymd.month() is February and ymd.day() is not in the range [1d,28d], ok() can return false for
the resultant year_month_day. — end note]

```

```

constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;
12   Returns: ymd + dy.

constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;
13   Returns: ymd + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);
14   Effects: Equivalent to:
    return os << (ymd.ok() ?
        format(STATICALLY-WIDEN<charT>("{.%F}"), ymd) :
        format(STATICALLY-WIDEN<charT>("{.%F} is not a valid date"), ymd));
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
            year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
            minutes* offset = nullptr);
15   Effects: Attempts to parse the input stream is into the year_month_day ymd using the format flags
given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid year_month_day,
is.setstate(ios_base::failbit) is called and ymd is not modified. If %Z is used and successfully
parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is
used and successfully parsed, that value will be assigned to *offset if offset is non-null.

16   Returns: is.
```

29.8.15 Class year_month_day_last

[time.cal.ymdlast]

29.8.15.1 Overview

[time.cal.ymdlast.overview]

```

namespace std::chrono {
    class year_month_day_last {
        chrono::year           y_;           // exposition only
        chrono::month_day_last mdl_;         // exposition only

    public:
        constexpr year_month_day_last(const chrono::year& y,
                                       const chrono::month_day_last& mdl) noexcept;

        constexpr year_month_day_last& operator+=(const months& m) noexcept;
        constexpr year_month_day_last& operator-=(const months& m) noexcept;
        constexpr year_month_day_last& operator+=(const years& y) noexcept;
        constexpr year_month_day_last& operator-=(const years& y) noexcept;

        constexpr chrono::year           year()           const noexcept;
        constexpr chrono::month          month()          const noexcept;
        constexpr chrono::month_day_last month_day_last() const noexcept;
        constexpr chrono::day            day()            const noexcept;

        constexpr          operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
```

¹ year_month_day_last represents the last day of a specific year and month. year_month_day_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last day of a year and month.

[Note 1: year_month_day_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_day_last meets the Cpp17EqualityComparable (Table 28) and Cpp17LessThanComparable (Table 29) requirements.

² `year_month_day_last` is a trivially copyable and standard-layout class type.

29.8.15.2 Member functions

[time.cal.ymdlast.members]

```
constexpr year_month_day_last(const chrono::year& y,
                           const chrono::month_day_last& mdl) noexcept;
```

1 *Effects:* Initializes `y_` with `y` and `mdl_` with `mdl`.

```
constexpr year_month_day_last& operator+=(const months& m) noexcept;
```

2 *Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Effects:* `*this = *this + m.`

4 *Returns:* `*this.`

```
constexpr year_month_day_last& operator-=(const months& m) noexcept;
```

5 *Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 *Effects:* `*this = *this - m.`

7 *Returns:* `*this.`

```
constexpr year_month_day_last& operator+=(const years& y) noexcept;
```

8 *Effects:* `*this = *this + y.`

9 *Returns:* `*this.`

```
constexpr year_month_day_last& operator-=(const years& y) noexcept;
```

10 *Effects:* `*this = *this - y.`

11 *Returns:* `*this.`

```
constexpr chrono::year year() const noexcept;
```

12 *Returns:* `y_.`

```
constexpr chrono::month month() const noexcept;
```

13 *Returns:* `mdl_.month().`

```
constexpr chrono::month_day_last month_day_last() const noexcept;
```

14 *Returns:* `mdl_.`

```
constexpr chrono::day day() const noexcept;
```

15 *Returns:* If `ok()` is `true`, returns a `day` representing the last day of the (`year`, `month`) pair represented by `*this`. Otherwise, the returned value is unspecified.

16 *[Note 1:* This value might be computed on demand. — *end note*]

```
constexpr operator sys_days() const noexcept;
```

17 *Returns:* `sys_days{year()/month()/day()}.`

```
constexpr explicit operator local_days() const noexcept;
```

18 *Returns:* `local_days{sys_days{*this}.time_since_epoch()}.`

```
constexpr bool ok() const noexcept;
```

19 *Returns:* `y_.ok() && mdl_.ok().`

29.8.15.3 Non-member functions

[time.cal.ymdlast.nonmembers]

```
constexpr bool operator==(const year_month_day_last& x, const year_month_day_last& y) noexcept;
```

1 *Returns:* `x.year() == y.year() && x.month_day_last() == y.month_day_last().`

```
constexpr strong_ordering operator<=>(const year_month_day_last& x,  
                                      const year_month_day_last& y) noexcept;
```

2 *Effects:* Equivalent to:

```
if (auto c = x.year() <= y.year(); c != 0) return c;
return x.month_day_last() <= y.month_day_last();
```

```
constexpr year_month_day_last  
operator+(const year_month_day_last& ymdl, const months& dm) noexcept;
```

3 Constraints: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

Returns: (ymdl.year() / ymdl.month() + dm) / last.

```
constexpr year_month_day_last  
operator+(const months& dm, const year_month_day_last& ymdl) noexcept;
```

5 Constraints: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 >Returns: ymdl + dm.

```
constexpr year_month_day_last  
operator-(const year_month_day_last& ymdl, const months& dm) noexcept;
```

Constraints: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

8 >Returns: ymd1 + (-dm).

```
constexpr year_month_day_last  
operator+(const year_month_day_last& ymdl, const years& dy) noexcept;
```

Returns: {ymdl.year() + dy, ymdl.month_day_last()}.
9

```
constexpr year_month_day_last  
operator+(const years& dy, const year_month_day_last& ymdl) noexcept;
```

10 *Returns:* ymdl + dy.

```
constexpr year_month_day_last  
operator-(const year_month_day_last& ymdl, const years& dy) noexcept;
```

11 >Returns: ymd1 + (-dy).

```
template<class charT, class traits>
    basic_ostream<charT, traits>&
```

```
operator<<(basic_ostream&)
```

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{{}/:{}L}")) ,
```

29.8.16 Glass moon month weekday

[time cal vmwd]

20.8.16.1 - Q : :

[time.cal.ymwd.overview]

```
namespace std::chrono {
    class year_month_weekday {
        chrono::year           y_;           // exposition only
        chrono::month          m_;           // exposition only
        chrono::weekday_indexed wdi_;        // exposition only

    public:
        year_month_weekday() = default;
        constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                                      const chrono::weekday_indexed& wdi) noexcept;
        constexpr year_month_weekday(const sys_days& dp) noexcept;
        constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

```

constexpr year_month_weekday& operator+=(const months& m) noexcept;
constexpr year_month_weekday& operator-=(const months& m) noexcept;
constexpr year_month_weekday& operator+=(const years& y) noexcept;
constexpr year_month_weekday& operator-=(const years& y) noexcept;

constexpr chrono::year year() const noexcept;
constexpr chrono::month month() const noexcept;
constexpr chrono::weekday weekday() const noexcept;
constexpr unsigned index() const noexcept;
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

constexpr operator sys_days() const noexcept;
constexpr explicit operator local_days() const noexcept;
constexpr bool ok() const noexcept;
};

}

```

¹ `year_month_weekday` represents a specific year, month, and n^{th} weekday of the month. `year_month_weekday` is a field-based time point with a resolution of `days`.

[*Note 1:* `year_month_weekday` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_weekday` meets the *Cpp17EqualityComparable* ([Table 28](#)) requirements.

² `year_month_weekday` is a trivially copyable and standard-layout class type.

29.8.16.2 Member functions

[`time.cal.ymwd.members`]

```
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                             const chrono::weekday_indexed& wdi) noexcept;
```

¹ *Effects:* Initializes `y_` with `y`, `m_` with `m`, and `wdi_` with `wdi`.

```
constexpr year_month_weekday(const sys_days& dp) noexcept;
```

² *Effects:* Constructs an object of type `year_month_weekday` which corresponds to the date represented by `dp`.

³ *Remarks:* For any value `ymwd` of type `year_month_weekday` for which `ymwd.ok()` is `true`, `ymwd == year_month_weekday{sys_days{ymwd}}` is `true`.

```
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

⁴ *Effects:* Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_weekday& operator+=(const months& m) noexcept;
```

⁵ *Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` ([12.2.4.3](#)).

⁶ *Effects:* `*this = *this + m`.

⁷ *Returns:* `*this`.

```
constexpr year_month_weekday& operator-=(const months& m) noexcept;
```

⁸ *Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` ([12.2.4.3](#)).

⁹ *Effects:* `*this = *this - m`.

¹⁰ *Returns:* `*this`.

```
constexpr year_month_weekday& operator+=(const years& y) noexcept;
```

¹¹ *Effects:* `*this = *this + y`.

¹² *Returns:* `*this`.

```
constexpr year_month_weekday& operator-=(const years& y) noexcept;
```

¹³ *Effects:* `*this = *this - y`.

¹⁴ *Returns:* `*this`.

```

constexpr chrono::year year() const noexcept;
15   Returns: y_.

constexpr chrono::month month() const noexcept;
16   Returns: m_.

constexpr chrono::weekday weekday() const noexcept;
17   Returns: wdi_.weekday().

constexpr unsigned index() const noexcept;
18   Returns: wdi_.index().

constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
19   Returns: wdi_.

constexpr operator sys_days() const noexcept;
20   Returns: If y_.ok() && m_.ok() && wdi_.weekday().ok(), returns a sys_days that represents
              the date (index() - 1) * 7 days after the first weekday() of year()/month(). If index() is 0
              the returned sys_days represents the date 7 days prior to the first weekday() of year()/month().
              Otherwise the returned value is unspecified.

constexpr explicit operator local_days() const noexcept;
21   Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
22   Returns: If any of y_.ok(), m_.ok(), or wdi_.ok() is false, returns false. Otherwise, if *this
              represents a valid date, returns true. Otherwise, returns false.

```

29.8.16.3 Non-member functions

[time.cal.ymwd.nonmembers]

```

constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;
1   Returns:
      x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()

constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;
2   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
                  implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
3   Returns: (ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed().

constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;
4   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
                  implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
5   Returns: ymwd + dm.

constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;
6   Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
                  implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
7   Returns: ymwd + (-dm).

```

```

constexpr year_month_weekday_last
operator+(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
8   Returns: {ymwdl.year() + dy, ymwdl.month(), ymwdl.weekday_last()}.

constexpr year_month_weekday_last
operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;
9   Returns: ymwdl + dy.

constexpr year_month_weekday_last
operator-(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
10  Returns: ymwdl + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);
11 Effects: Equivalent to:
           return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}/{:L}"),
                                ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());

```

29.8.18 Conventional syntax operators

[time.cal.operators]

- 1 A set of overloaded operator/ functions provides a conventional syntax for the creation of civil calendar dates.
- 2 [Note 1: The year, month, and day are accepted in any of the following 3 orders:

year/month/day
month/day/year
day/month/year

Anywhere a *day* is required, any of the following can also be specified:

last
weekday [i]
weekday [last]
— end note

- 3 [Note 2: Partial-date types such as *year_month* and *month_day* can be created by not applying the second division operator for any of the three orders. For example:

```

year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;
— end note]

```

- 4 [Example 1:

```

auto a = 2015/4/4;           // a == int(125)
auto b = 2015y/4/4;          // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;    // error: no viable operator/ for first /
auto d = 2015/April/4;      // error: no viable operator/ for first /
— end example]

```

```

constexpr year_month
operator/(const year& y, const month& m) noexcept;
5   Returns: {y, m}.

```

```

constexpr year_month
operator/(const year& y, int m) noexcept;
6   Returns: y / month(m).

```

```

constexpr month_day
operator/(const month& m, const day& d) noexcept;
7   Returns: {m, d}.

```

```

constexpr month_day
operator/(const month& m, int d) noexcept;
8     Returns: m / day(d).

constexpr month_day
operator/(int m, const day& d) noexcept;
9     Returns: month(m) / d.

constexpr month_day
operator/(const day& d, const month& m) noexcept;
10    Returns: m / d.

constexpr month_day
operator/(const day& d, int m) noexcept;
11    Returns: month(m) / d.

constexpr month_day_last
operator/(const month& m, last_spec) noexcept;
12    Returns: month_day_last{m}.

constexpr month_day_last
operator/(int m, last_spec) noexcept;
13    Returns: month(m) / last.

constexpr month_day_last
operator/(last_spec, const month& m) noexcept;
14    Returns: m / last.

constexpr month_day_last
operator/(last_spec, int m) noexcept;
15    Returns: month(m) / last.

constexpr month_weekday
operator/(const month& m, const weekday_indexed& wdi) noexcept;
16    Returns: {m, wdi}.

constexpr month_weekday
operator/(int m, const weekday_indexed& wdi) noexcept;
17    Returns: month(m) / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, const month& m) noexcept;
18    Returns: m / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, int m) noexcept;
19    Returns: month(m) / wdi.

constexpr month_weekday_last
operator/(const month& m, const weekday_last& wdl) noexcept;
20    Returns: {m, wdl}.

constexpr month_weekday_last
operator/(int m, const weekday_last& wdl) noexcept;
21    Returns: month(m) / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, const month& m) noexcept;
22    Returns: m / wdl.

```

```

constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;
23   Returns: month(m) / wdl.

constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;
24   Returns: {ym.year(), ym.month(), d}.

constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;
25   Returns: ym / day(d).

constexpr year_month_day
operator/(const year& y, const month_day& md) noexcept;
26   Returns: y / md.month() / md.day().

constexpr year_month_day
operator/(int y, const month_day& md) noexcept;
27   Returns: year(y) / md.

constexpr year_month_day
operator/(const month_day& md, const year& y) noexcept;
28   Returns: y / md.

constexpr year_month_day
operator/(const month_day& md, int y) noexcept;
29   Returns: year(y) / md.

constexpr year_month_day_last
operator/(const year_month& ym, last_spec) noexcept;
30   Returns: {ym.year(), month_day_last{ym.month()}};

constexpr year_month_day_last
operator/(const year& y, const month_day_last& mdl) noexcept;
31   Returns: {y, mdl}.

constexpr year_month_day_last
operator/(int y, const month_day_last& mdl) noexcept;
32   Returns: year(y) / mdl.

constexpr year_month_day_last
operator/(const month_day_last& mdl, const year& y) noexcept;
33   Returns: y / mdl.

constexpr year_month_day_last
operator/(const month_day_last& mdl, int y) noexcept;
34   Returns: year(y) / mdl.

constexpr year_month_weekday
operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
35   Returns: {ym.year(), ym.month(), wdi}.

constexpr year_month_weekday
operator/(const year& y, const month_weekday& mwd) noexcept;
36   Returns: {y, mwd.month(), mwd.weekday_indexed()}.

constexpr year_month_weekday
operator/(int y, const month_weekday& mwd) noexcept;
37   Returns: year(y) / mwd.

```

```

constexpr year_month_weekday
operator/(const month_weekday& mwd, const year& y) noexcept;
38   Returns: y / mwd.

constexpr year_month_weekday
operator/(const month_weekday& mwd, int y) noexcept;
39   Returns: year(y) / mwd.

constexpr year_month_weekday_last
operator/(const year_month& ym, const weekday_last& wdl) noexcept;
40   Returns: {ym.year(), ym.month(), wdl}.

constexpr year_month_weekday_last
operator/(const year& y, const month_weekday_last& mwdl) noexcept;
41   Returns: {y, mwdl.month(), mwdl.weekday_last()}.

constexpr year_month_weekday_last
operator/(int y, const month_weekday_last& mwdl) noexcept;
42   Returns: year(y) / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, const year& y) noexcept;
43   Returns: y / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, int y) noexcept;
44   Returns: year(y) / mwdl.

```

29.9 Class template hh_mm_ss

[time.hms]

29.9.1 Overview

[time.hms.overview]

```

namespace std::chrono {
    template<class Duration> class hh_mm_ss {
        public:
            static constexpr unsigned fractional_width = see below;
            using precision = see below;

            constexpr hh_mm_ss() noexcept : hh_mm_ss{Duration::zero()} {}
            constexpr explicit hh_mm_ss(Duration d);

            constexpr bool is_negative() const noexcept;
            constexpr chrono::hours hours() const noexcept;
            constexpr chrono::minutes minutes() const noexcept;
            constexpr chrono::seconds seconds() const noexcept;
            constexpr precision subseconds() const noexcept;

            constexpr explicit operator precision() const noexcept;
            constexpr precision to_duration() const noexcept;

        private:
            bool is_neg; // exposition only
            chrono::hours h; // exposition only
            chrono::minutes m; // exposition only
            chrono::seconds s; // exposition only
            precision ss; // exposition only
    };
}

```

¹ The `hh_mm_ss` class template splits a `duration` into a multi-field time structure `hours:minutes:seconds` and possibly `subseconds`, where `subseconds` will be a duration unit based on a non-positive power of 10. The `Duration` template parameter dictates the precision to which the time is split. A `hh_mm_ss` models negative durations with a distinct `is_negative` getter that returns `true` when the input duration is negative. The

individual duration fields always return non-negative durations even when `is_negative()` indicates the structure is representing a negative duration.

- 2 If `Duration` is not a specialization of `duration`, the program is ill-formed.

29.9.2 Members

[`time.hms.members`]

```
static constexpr unsigned fractional_width = see below;
```

- 1 `fractional_width` is the number of fractional decimal digits represented by `precision`. `fractional_width` has the value of the smallest possible integer in the range [0, 18] such that `precision` will exactly represent all values of `Duration`. If no such value of `fractional_width` exists, then `fractional_width` is 6.

[*Example 1*: See [Table 100](#) for some durations, the resulting `fractional_width`, and the formatted fractional second output of `Duration{1}`.

Table 100 — Examples for `fractional_width` [tab:`time.hms.width`]

Duration	<code>fractional_width</code>	Formatted fractional second output
hours, minutes, and seconds	0	
milliseconds	3	0.001
microseconds	6	0.000001
nanoseconds	9	0.000000001
<code>duration<int, ratio<1, 2>></code>	1	0.5
<code>duration<int, ratio<1, 3>></code>	6	0.333333
<code>duration<int, ratio<1, 4>></code>	2	0.25
<code>duration<int, ratio<1, 5>></code>	1	0.2
<code>duration<int, ratio<1, 6>></code>	6	0.166666
<code>duration<int, ratio<1, 7>></code>	6	0.142857
<code>duration<int, ratio<1, 8>></code>	3	0.125
<code>duration<int, ratio<1, 9>></code>	6	0.111111
<code>duration<int, ratio<1, 10>></code>	1	0.1
<code>duration<int, ratio<756, 625>></code>	4	0.2096

— *end example*]

```
using precision = see below;
```

- 2 `precision` is

```
duration<common_type_t<Duration::rep, seconds::rep>, ratio<1, 10fractional_width>>
```

```
constexpr explicit hh_mm_ss(Duration d);
```

- 3 *Effects*: Constructs an object of type `hh_mm_ss` which represents the `Duration` `d` with precision `precision`.

- (3.1) — Initializes `is_neg` with `d < Duration::zero()`.
- (3.2) — Initializes `h` with `duration_cast<chrono::hours>(abs(d))`.
- (3.3) — Initializes `m` with `duration_cast<chrono::minutes>(abs(d) - hours())`.
- (3.4) — Initializes `s` with `duration_cast<chrono::seconds>(abs(d) - hours() - minutes())`.
- (3.5) — If `treat_as_floating_point_v<precision::rep>` is true, initializes `ss` with `abs(d) - hours() - minutes() - seconds()`. Otherwise, initializes `ss` with `duration_cast<precision>(abs(d) - hours() - minutes() - seconds())`.

[*Note 1*: When `precision::rep` is integral and `precision::period` is `ratio<1>`, `subseconds()` always returns a value equal to 0s. — *end note*]

- 4 *Postconditions*: If `treat_as_floating_point_v<precision::rep>` is true, `to_duration()` returns `d`, otherwise `to_duration()` returns `duration_cast<precision>(d)`.

```
constexpr bool is_negative() const noexcept;
```

- 5 *Returns*: `is_neg`.

```

constexpr chrono::hours hours() const noexcept;
6   Returns: h.

constexpr chrono::minutes minutes() const noexcept;
7   Returns: m.

constexpr chrono::seconds seconds() const noexcept;
8   Returns: s.

constexpr precision subseconds() const noexcept;
9   Returns: ss.

constexpr precision to_duration() const noexcept;
10  Returns: If is_neg, returns -(h + m + s + ss), otherwise returns h + m + s + ss.

constexpr explicit operator precision() const noexcept;
11  Returns: to_duration().

```

29.9.3 Non-members

[time.hms.nonmembers]

```

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);

```

1 Effects: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%T}"), hms);
```

2 [Example 1:

```

for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
    hh_mm_ss hms{ms};
    cout << hms << '\n';
}
cout << hh_mm_ss{65745s} << '\n';

```

Produces the output (assuming the "C" locale):

```

-01:08:03.007
01:08:03.007
18:15:45.123
18:15:45

```

— end example]

29.10 12/24 hours functions

[time.12]

1 These functions aid in translating between a 12h format time of day and a 24h format time of day.

```
constexpr bool is_am(const hours& h) noexcept;
```

2 Returns: 0h <= h && h <= 11h.

```
constexpr bool is_pm(const hours& h) noexcept;
```

3 Returns: 12h <= h && h <= 23h.

```
constexpr hours make12(const hours& h) noexcept;
```

4 Returns: The 12-hour equivalent of h in the range [1h, 12h]. If h is not in the range [0h, 23h], the value returned is unspecified.

```
constexpr hours make24(const hours& h, bool is_pm) noexcept;
```

5 Returns: If is_pm is false, returns the 24-hour equivalent of h in the range [0h, 11h], assuming h represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of h in the range [12h, 23h], assuming h represents a post meridiem hour. If h is not in the range [1h, 12h], the value returned is unspecified.

29.11 Time zones

[time.zone]

29.11.1 In general

[time.zone.general]

- ¹ 29.11 describes an interface for accessing the IANA Time Zone Database that interoperates with `sys_time` and `local_time`. This interface provides time zone support to both the civil calendar types (29.8) and to user-defined calendars.

29.11.2 Time zone database

[time.zone.db]

29.11.2.1 Class `tzdb`

[time.zone.db.tzdb]

```
namespace std::chrono {
    struct tzdb {
        string             version;
        vector<time_zone> zones;
        vector<time_zone_link> links;
        vector<leap_second> leap_seconds;

        const time_zone* locate_zone(string_view tz_name) const;
        const time_zone* current_zone() const;
    };
}
```

- ¹ Each vector in a `tzdb` object is sorted to enable fast lookup.

```
const time_zone* locate_zone(string_view tz_name) const;
```

- ² *Returns:*

- (2.1) — If `zones` contains an element `tz` for which `tz.name() == tz_name`, a pointer to `tz`;
- (2.2) — otherwise, if `links` contains an element `tz_1` for which `tz_1.name() == tz_name`, then a pointer to the element `tz` of `zones` for which `tz.name() == tz_1.target()`.

[*Note 1*: A `time_zone_link` specifies an alternative name for a `time_zone`. — *end note*]

- ³ *Throws*: If a `const time_zone*` cannot be found as described in the *Returns*: element, throws a `runtime_error`.

[*Note 2*: On non-exceptional return, the return value is always a pointer to a valid `time_zone`. — *end note*]

```
const time_zone* current_zone() const;
```

- ⁴ *Returns*: A pointer to the time zone which the computer has set as its local time zone.

29.11.2.2 Class `tzdb_list`

[time.zone.db.list]

```
namespace std::chrono {
    class tzdb_list {
        public:
            tzdb_list(const tzdb_list&) = delete;
            tzdb_list& operator=(const tzdb_list&) = delete;

            // unspecified additional constructors

            class const_iterator;

            const tzdb& front() const noexcept;

            const_iterator erase_after(const_iterator p);

            const_iterator begin() const noexcept;
            const_iterator end() const noexcept;

            const_iterator cbegin() const noexcept;
            const_iterator cend() const noexcept;
    };
}
```

- ¹ The `tzdb_list` database is a singleton; the unique object of type `tzdb_list` can be accessed via the `get_tzdb_list()` function.

[*Note 1*: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the `front()` of this list via the read-only namespace scope functions `get_tzdb()`, `locate_zone()`, and `current_zone()`. — *end note*]

The `tzdb_list` object contains a list of `tzdb` objects.

- 2 `tzdb_list::const_iterator` is a constant iterator which meets the *Cpp17ForwardIterator* requirements and has a value type of `tzdb`.

3 `const tzdb& front() const noexcept;`

Synchronization: This operation is thread-safe with respect to `reload_tzdb()`.

[*Note 2*: `reload_tzdb()` pushes a new `tzdb` onto the front of this container. — *end note*]

- 4 *Returns*: A reference to the first `tzdb` in the container.

5 `const_iterator erase_after(const_iterator p);`

Preconditions: The iterator following `p` is dereferenceable.

6 *Effects*: Erases the `tzdb` referred to by the iterator following `p`.

- 7 *Postconditions*: No pointers, references, or iterators are invalidated except those referring to the erased `tzdb`.

[*Note 3*: It is not possible to erase the `tzdb` referred to by `begin()`. — *end note*]

- 8 *Returns*: An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

- 9 *Throws*: Nothing.

10 `const_iterator begin() const noexcept;`

Returns: An iterator referring to the first `tzdb` in the container.

11 `const_iterator end() const noexcept;`

Returns: An iterator referring to the position one past the last `tzdb` in the container.

12 `const_iterator cbegin() const noexcept;`

Returns: `begin()`.

13 `const_iterator cend() const noexcept;`

Returns: `end()`.

29.11.2.3 Time zone database access

[time.zone.db.access]

`tzdb_list& get_tzdb_list();`

Effects: If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a `tzdb_list` holding a single initialized `tzdb`.

Synchronization: It is safe to call this function from multiple threads at one time.

Returns: A reference to the database.

- 4 *Throws*: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb_list` containing one or more valid `tzdb`s.

5 `const tzdb& get_tzdb();`

Returns: `get_tzdb_list().front()`.

6 `const time_zone* locate_zone(string_view tz_name);`

Returns: `get_tzdb().locate_zone(tz_name)`.

- 7 [*Note 1*: The time zone database will be initialized if this is the first reference to the database. — *end note*]

8 `const time_zone* current_zone();`

Returns: `get_tzdb().current_zone()`.

29.11.2.4 Remote time zone database support

[time.zone.db.remote]

- ¹ The local time zone database is that supplied by the implementation when the program first accesses the database, for example via `current_zone()`. While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the *remote time zone database*.

```
const tzdb& reload_tzdb();
```

- ² *Effects*: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the `tzdb_list` accessed by `get_tzdb_list()`.

- ³ *Synchronization*: This function is thread-safe with respect to `get_tzdb_list().front()` and `get_tzdb_list().erase_after()`.

- ⁴ *Postconditions*: No pointers, references, or iterators are invalidated.

- ⁵ *Returns*: `get_tzdb_list().front()`.

- ⁶ *Throws*: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb`.

```
string remote_version();
```

- ⁷ *Returns*: The latest remote database version.

[*Note 1*: This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent. — *end note*]

29.11.3 Exception classes

[time.zone.exception]

29.11.3.1 Class nonexistent_local_time

[time.zone.exception.nonexist]

```
namespace std::chrono {
    class nonexistent_local_time : public runtime_error {
    public:
        template<class Duration>
        nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}
```

- ¹ `nonexistent_local_time` is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```
template<class Duration>
nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
```

- ² *Preconditions*: `i.result == local_info::nonexistent` is true.

- ³ *Effects*: Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is in a gap between\n"
    << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ' '
    << i.first.abbrev << " and\n"
    << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ' '
    << i.second.abbrev
    << " which are both equivalent to\n"
    << i.first.end << " UTC";
```

- ⁴ [*Example 1*:

```
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
                            local_days{Sunday[2]/March/2016} + 2h + 30min};
```

```

    } catch (const nonexistent_local_time& e) {
        std::cout << e.what() << '\n';
    }
}

```

Produces the output:

```

2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC

```

— end example]

29.11.3.2 Class ambiguous_local_time

[time.zone.exception.ambig]

```

namespace std::chrono {
    class ambiguous_local_time : public runtime_error {
public:
    template<class Duration>
    ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
};
}

```

- ¹ `ambiguous_local_time` is thrown when an attempt is made to convert an ambiguous `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

² `Preconditions`: `i.result == local_info::ambiguous` is true.

- ³ `Effects`: Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```

ostringstream os;
os << tp << " is ambiguous. It could be\n"
    << tp << ' ' << i.first.abbrev << " == "
    << tp - i.first.offset << " UTC or\n"
    << tp << ' ' << i.second.abbrev << " == "
    << tp - i.second.offset << " UTC";

```

- ⁴ [Example 1:

```

#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time{"America/New_York",
            local_days{Sunday[1]/November/2016} + 1h + 30min};
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << '\n';
    }
}

```

Produces the output:

```

2016-11-06 01:30:00 is ambiguous. It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC

```

— end example]

29.11.4 Information classes

[time.zone.info]

29.11.4.1 Class sys_info

[time.zone.info.sys]

```

namespace std::chrono {
    struct sys_info {
        sys_seconds begin;
}

```

```

    sys_seconds  end;
    seconds      offset;
    minutes     save;
    string       abbrev;
};

}

```

- 1 A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.
- 2 [Note 1: This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly. —end note]
- 3 The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range $[\text{begin}, \text{end})$. This information can be used to efficiently iterate the transitions of a `time_zone`.
- 4 The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:

```
offset = local_time - sys_time
```

- 5 The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0min`, this `sys_info` is said to be on “daylight saving” time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range $[\text{begin}, \text{end})$ (if `save != 0min` for this `sys_info`).
- 6 The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_info& r);

Effects: Streams out the sys_info object r in an unspecified format.

Returns: os.
```

29.11.4.2 Class `local_info`

[time.zone.info.local]

```
namespace std::chrono {
    struct local_info {
        static constexpr int unique      = 0;
        static constexpr int nonexistent = 1;
        static constexpr int ambiguous   = 2;

        int result;
        sys_info first;
        sys_info second;
    };
}
```

- 1 [Note 1: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly. —end note]
- 2 Describes the result of converting a `local_time` to a `sys_time` as follows:
 - (2.1) — When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.
 - (2.2) — If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.
 - (2.3) — If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_info& r);
3   Effects: Streams out the local_info object r in an unspecified format.
4   Returns: os.
```

29.11.5 Class time_zone

29.11.5.1 Overview

[time.zone.timezone]

[time.zone.overview]

```
namespace std::chrono {
    class time_zone {
        public:
            time_zone(time_zone&&) = default;
            time_zone& operator=(time_zone&&) = default;

            // unspecified additional constructors

            string_view name() const noexcept;

            template<class Duration> sys_info get_info(const sys_time<Duration>& st) const;
            template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

            template<class Duration>
            sys_time<common_type_t<Duration, seconds>>
            to_sys(const local_time<Duration>& tp) const;

            template<class Duration>
            sys_time<common_type_t<Duration, seconds>>
            to_sys(const local_time<Duration>& tp, choose z) const;

            template<class Duration>
            local_time<common_type_t<Duration, seconds>>
            to_local(const sys_time<Duration>& tp) const;
    };
}
```

- ¹ A time_zone represents all time zone transitions for a specific geographic area. time_zone construction is unspecified, and performed as part of database initialization.

[Note 1: const time_zone objects can be accessed via functions such as locate_zone. —end note]

29.11.5.2 Member functions

[time.zone.members]

```
string_view name() const noexcept;
```

- ¹ Returns: The name of the time_zone.

[Example 1: "America/New_York". —end example]

```
template<class Duration>
sys_info get_info(const sys_time<Duration>& st) const;
```

- ³ Returns: A sys_info i for which st is in the range [i.begin, i.end).

```
template<class Duration>
local_info get_info(const local_time<Duration>& tp) const;
```

- ⁴ Returns: A local_info for tp.

```
template<class Duration>
sys_time<common_type_t<Duration, seconds>>
to_sys(const local_time<Duration>& tp) const;
```

- ⁵ Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has finer precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone.

- ⁶ Throws: If the conversion from tp to a sys_time is ambiguous, throws ambiguous_local_time. If the tp represents a non-existent time between two UTC time_points, throws nonexistent_local_time.

```
template<class Duration>
sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp, choose z) const;
```

7 >Returns: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`. If the conversion from `tp` to a `sys_time` is ambiguous, returns the earlier `sys_time` if `z == choose::earliest`, and returns the later `sys_time` if `z == choose::latest`. If the `tp` represents a non-existent time between two UTC `time_points`, then the two UTC `time_points` will be the same, and that UTC `time_point` will be returned.

```
template<class Duration>
local_time<common_type_t<Duration, seconds>>
    to_local(const sys_time<Duration>& tp) const;
```

8 >Returns: The `local_time` associated with `tp` and this `time_zone`.

29.11.5.3 Non-member functions

[time.zone.nonmembers]

```
bool operator==(const time_zone& x, const time_zone& y) noexcept;
1     >Returns: x.name() == y.name().
```

```
strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;
2     >Returns: x.name() <= y.name().
```

29.11.6 Class template `zoned_traits`

[time.zone.zonedtraits]

```
namespace std::chrono {
    template<class T> struct zoned_traits {};
}
```

1 `zoned_traits` provides a means for customizing the behavior of `zoned_time<Duration, TimeZonePtr>` for the `zoned_time` default constructor, and constructors taking `string_view`. A specialization for `const time_zone*` is provided by the implementation:

```
namespace std::chrono {
    template<> struct zoned_traits<const time_zone*> {
        static const time_zone* default_zone();
        static const time_zone* locate_zone(string_view name);
    };
}

static const time_zone* default_zone();

2     >Returns: std::chrono::locate_zone("UTC").
```

```
static const time_zone* locate_zone(string_view name);

3     >Returns: std::chrono::locate_zone(name).
```

29.11.7 Class template `zoned_time`

[time.zone.zonedtime]

29.11.7.1 Overview

[time.zone.zonedtime.overview]

```
namespace std::chrono {
    template<class Duration, class TimeZonePtr = const time_zone*>
    class zoned_time {
    public:
        using duration = common_type_t<Duration, seconds>;
        private:
            TimeZonePtr zone_; // exposition only
            sys_time<duration> tp_; // exposition only
        using traits = zoned_traits<TimeZonePtr>; // exposition only
    public:
        zoned_time();
        zoned_time(const zoned_time&) = default;
```

```

zoned_time& operator=(const zoned_time&) = default;

zoned_time(const sys_time<Duration>& st);
explicit zoned_time(TimeZonePtr z);
explicit zoned_time(string_view name);

template<class Duration2>
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);

zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
zoned_time(string_view name, const sys_time<Duration>& st);

zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
zoned_time(string_view name, const local_time<Duration>& tp);
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
zoned_time(string_view name, const local_time<Duration>& tp, choose c);

template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);

zoned_time& operator=(const sys_time<Duration>& st);
zoned_time& operator=(const local_time<Duration>& lt);

operator sys_time<duration>() const;
explicit operator local_time<duration>() const;

TimeZonePtr get_time_zone() const;
local_time<duration> get_local_time() const;
sys_time<duration> get_sys_time() const;
sys_info get_info() const;
};

zoned_time() -> zoned_time<seconds>;

template<class Duration>
zoned_time(sys_time<Duration>)
-> zoned_time<common_type_t<Duration, seconds>>;

template<class TimeZonePtrOrName>
using time-zone-representation =           // exposition only
conditional_t<is_convertible_v<TimeZonePtrOrName, string_view>,
            const time_zone*,
            remove_cvref_t<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName>
zoned_time(TimeZonePtrOrName&&)
-> zoned_time<seconds, time-zone-representation<TimeZonePtrOrName>>; 

template<class TimeZonePtrOrName, class Duration>
zoned_time(TimeZonePtrOrName&&, sys_time<Duration>)
-> zoned_time<common_type_t<Duration, seconds>,
            time-zone-representation<TimeZonePtrOrName>>; 

template<class TimeZonePtrOrName, class Duration>
zoned_time(TimeZonePtrOrName&&, local_time<Duration>,
            choose = choose::earliest)
-> zoned_time<common_type_t<Duration, seconds>,

```

```

    time-zone-representation<TimeZonePtrOrName>>;
```

$$\begin{aligned} \text{template}<\text{class Duration, class TimeZonePtrOrName, class TimeZonePtr2}> \\ \quad \text{zoned_time}(\text{TimeZonePtrOrName}\&\&, \text{zoned_time}<\text{Duration, TimeZonePtr2}>, \\ \quad \quad \text{choose} = \text{choose}::\text{earliest}) \\ \rightarrow \text{zoned_time}<\text{common_type_t}<\text{Duration, seconds}>, \\ \quad \quad \text{time-zone-representation}<\text{TimeZonePtrOrName}>; \\ \end{aligned}$$
}

- 1 `zoned_time` represents a logical pairing of a `time_zone` and a `time_point` with precision `Duration`. `zoned_time<Duration>` maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.
- 2 If `Duration` is not a specialization of `chrono::duration`, the program is ill-formed.
- 3 Every constructor of `zoned_time` that accepts a `string_view` as its first parameter does not participate in class template argument deduction ([12.2.2.9](#)).

29.11.7.2 Constructors

[`time.zone.zonedtime.ctor`]

```

zoned_time();
```

1 *Constraints*: `traits::default_zone()` is a well-formed expression.

2 *Effects*: Initializes `zone_` with `traits::default_zone()` and default constructs `tp_`.

```

zoned_time(const sys_time<Duration>& st);
```

3 *Constraints*: `traits::default_zone()` is a well-formed expression.

4 *Effects*: Initializes `zone_` with `traits::default_zone()` and `tp_` with `st`.

```

explicit zoned_time(TimeZonePtr z);
```

5 *Preconditions*: `z` refers to a time zone.

6 *Effects*: Initializes `zone_` with `std::move(z)` and default constructs `tp_`.

```

explicit zoned_time(string_view name);
```

7 *Constraints*: `traits::locate_zone(string_view{})` is a well-formed expression and `zoned_time` is constructible from the return type of `traits::locate_zone(string_view{})`.

8 *Effects*: Initializes `zone_` with `traits::locate_zone(name)` and default constructs `tp_`.

```

template<class Duration2>
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
```

9 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.

10 *Effects*: Initializes `zone_` with `y.zone_` and `tp_` with `y.tp_`.

```

zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
```

11 *Preconditions*: `z` refers to a time zone.

12 *Effects*: Initializes `zone_` with `std::move(z)` and `tp_` with `st`.

```

zoned_time(string_view name, const sys_time<Duration>& st);
```

13 *Constraints*: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `st`.

14 *Effects*: Equivalent to construction with `{traits::locate_zone(name), st}`.

```

zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
```

15 *Constraints*:

```

    is_convertible_v<
        decltype(declval<TimeZonePtr&>() -> to_sys(local_time<Duration>{})),
        sys_time<duration>>
```

 is true.

16 *Preconditions*: `z` refers to a time zone.

17 *Effects:* Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp)`.

```
zoned_time(string_view name, const local_time<Duration>& tp);
```

18 *Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `tp`.

19 *Effects:* Equivalent to construction with `{traits::locate_zone(name), tp}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

20 *Constraints:*

```
is_convertible_v<
    decltype(declval<TimeZonePtr&>()>->to_sys(local_time<Duration>{}, choose::earliest)),
    sys_time<duration>>
```

 is true.

21 *Preconditions:* `z` refers to a time zone.

22 *Effects:* Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp, c)`.

```
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

23 *Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, `local_time<Duration>`, and `choose`.

24 *Effects:* Equivalent to construction with `{traits::locate_zone(name), tp, c}`.

template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);

25 *Constraints:* `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.

26 *Preconditions:* `z` refers to a valid time zone.

27 *Effects:* Initializes `zone_` with `std::move(z)` and `tp_` with `y.tp_`.

template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

28 *Constraints:* `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.

29 *Preconditions:* `z` refers to a valid time zone.

30 *Effects:* Equivalent to construction with `{z, y}`.

31 *[Note 1: The choose parameter has no effect. —end note]*

template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);

32 *Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

33 *Effects:* Equivalent to construction with `{traits::locate_zone(name), y}`.

template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);

34 *Constraints:* `zoned_time` is constructible from the return type of `traits::locate_zone(name)`, the type `zoned_time<Duration2, TimeZonePtr2>`, and the type `choose`.

35 *Effects:* Equivalent to construction with `{traits::locate_zone(name), y, c}`.

36 *[Note 2: The choose parameter has no effect. —end note]*

29.11.7.3 Member functions

[time.zone.zonedtime.members]

```
zoned_time& operator=(const sys_time<Duration>& st);
```

1 *Effects:* After assignment, `get_sys_time() == st`. This assignment has no effect on the return value of `get_time_zone()`.

2 *Returns:* `*this`.

```

zoned_time& operator=(const local_time<Duration>& lt);
3   Effects: After assignment, get_local_time() == lt. This assignment has no effect on the return
      value of get_time_zone().
4   Returns: *this.

operator sys_time<duration>() const;
5   Returns: get_sys_time().

explicit operator local_time<duration>() const;
6   Returns: get_local_time().

TimeZonePtr get_time_zone() const;
7   Returns: zone_.

local_time<duration> get_local_time() const;
8   Returns: zone_->to_local(tp_).

sys_time<duration> get_sys_time() const;
9   Returns: tp_.

sys_info get_info() const;
10  Returns: zone_->get_info(tp_).

```

29.11.7.4 Non-member functions

[time.zone.zonedtime.nonmembers]

```

template<class Duration1, class Duration2, class TimeZonePtr>
bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
                  const zoned_time<Duration2, TimeZonePtr>& y);

1   Returns: x.zone_ == y.zone_ && x.tp_ == y.tp_.

template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
            const zoned_time<Duration, TimeZonePtr>& t);

2   Effects: Equivalent to:
            return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T %Z}"), t);

```

29.11.8 Class leap_second

[time.zone.leap]

29.11.8.1 Overview

[time.zone.leap.overview]

```

namespace std::chrono {
    class leap_second {
        public:
            leap_second(const leap_second&) = default;
            leap_second& operator=(const leap_second&) = default;

            // unspecified additional constructors

            constexpr sys_seconds date() const noexcept;
            constexpr seconds value() const noexcept;
    };
}

```

¹ Objects of type `leap_second` representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

² [Example 1:

```

for (auto& l : get_tzdb().leap_seconds)
    if (l <= sys_days{2018y/March/17d})
        cout << l.date() << ":" << l.value() << '\n';

```

Produces the output:

```
1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s
1976-01-01 00:00:00: 1s
1977-01-01 00:00:00: 1s
1978-01-01 00:00:00: 1s
1979-01-01 00:00:00: 1s
1980-01-01 00:00:00: 1s
1981-07-01 00:00:00: 1s
1982-07-01 00:00:00: 1s
1983-07-01 00:00:00: 1s
1985-07-01 00:00:00: 1s
1988-01-01 00:00:00: 1s
1990-01-01 00:00:00: 1s
1991-01-01 00:00:00: 1s
1992-07-01 00:00:00: 1s
1993-07-01 00:00:00: 1s
1994-07-01 00:00:00: 1s
1996-01-01 00:00:00: 1s
1997-07-01 00:00:00: 1s
1999-01-01 00:00:00: 1s
2006-01-01 00:00:00: 1s
2009-01-01 00:00:00: 1s
2012-07-01 00:00:00: 1s
2015-07-01 00:00:00: 1s
2017-01-01 00:00:00: 1s
```

— end example]

29.11.8.2 Member functions

[time.zone.leap.members]

```
constexpr sys_seconds date() const noexcept;
```

¹ *Returns:* The date and time at which the leap second was inserted.

```
constexpr seconds value() const noexcept;
```

² *Returns:* +1s to indicate a positive leap second or -1s to indicate a negative leap second.

[Note 1: All leap seconds inserted up through 2022 were positive leap seconds. — end note]

29.11.8.3 Non-member functions

[time.zone.leap.nonmembers]

```
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
```

¹ *Returns:* x.date() == y.date().

```
constexpr strong_ordering operator<=(const leap_second& x, const leap_second& y) noexcept;
```

² *Returns:* x.date() <= y.date().

```
template<class Duration>
```

```
constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

³ *Returns:* x.date() == y.

```
template<class Duration>
```

```
constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

⁴ *Returns:* x.date() < y.

```
template<class Duration>
```

```
constexpr bool operator<(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

⁵ *Returns:* x < y.date().

```

template<class Duration>
constexpr bool operator>(const leap_second& x, const sys_time<Duration>& y) noexcept;
6   Returns: y < x.

template<class Duration>
constexpr bool operator>(const sys_time<Duration>& x, const leap_second& y) noexcept;
7   Returns: y < x.

template<class Duration>
constexpr bool operator<=(const leap_second& x, const sys_time<Duration>& y) noexcept;
8   Returns: !(y < x).

template<class Duration>
constexpr bool operator<=(const sys_time<Duration>& x, const leap_second& y) noexcept;
9   Returns: !(y < x).

template<class Duration>
constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;
10  Returns: !(x < y).

template<class Duration>
constexpr bool operator>=(const sys_time<Duration>& x, const leap_second& y) noexcept;
11  Returns: !(x < y).

template<class Duration>
requires three_way_comparable_with<sys_seconds, sys_time<Duration>>
constexpr auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;
12  Returns: x.date() <= y.

```

29.11.9 Class time_zone_link

[time.zone.link]

29.11.9.1 Overview

[time.zone.link.overview]

```

namespace std::chrono {
    class time_zone_link {
        public:
            time_zone_link(time_zone_link&&) = default;
            time_zone_link& operator=(time_zone_link&&) = default;

            // unspecified additional constructors

            string_view name() const noexcept;
            string_view target() const noexcept;
        };
    }
}

```

¹ A `time_zone_link` specifies an alternative name for a `time_zone`. `time_zone_links` are constructed when the time zone database is initialized.

29.11.9.2 Member functions

[time.zone.link.members]

```

string_view name() const noexcept;
1   Returns: The alternative name for the time zone.

string_view target() const noexcept;
2   Returns: The name of the time_zone for which this time_zone_link provides an alternative name.

```

29.11.9.3 Non-member functions

[time.zone.link.nonmembers]

```

bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;
1   Returns: x.name() == y.name().

```

```
strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;
2   Returns: x.name() <=> y.name().
```

29.12 Formatting

[time.format]

- ¹ Each `formatter` (22.14.6) specialization in the chrono library (29.2) meets the *Formatter* requirements (22.14.6.1). The `parse` member functions of these formatters interpret the format specification as a *chrono-format-spec* according to the following syntax:

```
chrono-format-spec:
  fill-and-alignopt widthopt precisionopt Lopt chrono-specsopt

chrono-specs:
  conversion-spec
  chrono-specs conversion-spec
  chrono-specs literal-char

literal-char:
  any character other than {, }, or %

conversion-spec:
  % modifieropt type

modifier: one of
  E 0

type: one of
  a A b B c C d D e F g G h H I j m M n
  p q Q r R S t T u U V w W x X y Y z Z %
```

The productions *fill-and-align*, *width*, and *precision* are described in 22.14.2. Giving a *precision* specification in the *chrono-format-spec* is valid only for types that are specializations of `std::chrono::duration` for which the nested `typedef-name rep` denotes a floating-point type. For all other types, an exception of type `format_error` is thrown if the *chrono-format-spec* contains a *precision* specification. All ordinary multibyte characters represented by *literal-char* are copied unchanged to the output.

- ² A *formatting locale* is an instance of `locale` used by a formatting function, defined as
- (2.1) — the "C" locale if the L option is not present in *chrono-format-spec*, otherwise
 - (2.2) — the locale passed to the formatting function if any, otherwise
 - (2.3) — the global locale.
- ³ Each conversion specifier *conversion-spec* is replaced by appropriate characters as described in Table 101; the formats specified in ISO 8601-1:2019 shall be used where so described. Some of the conversion specifiers depend on the formatting locale. If the string literal encoding is a Unicode encoding form and the locale is among an implementation-defined set of locales, each replacement that depends on the locale is performed as if the replacement character sequence is converted to the string literal encoding. If the formatted object does not contain the information the conversion specifier refers to, an exception of type `format_error` is thrown.
- ⁴ The result of formatting a `std::chrono::duration` instance holding a negative value, or an `hh_mm_ss` object `h` for which `h.is_negative()` is `true`, is equivalent to the output of the corresponding positive value, with a `STATICALLY-WIDEN<charT>"-"` character sequence placed before the replacement of the initial conversion specifier.

[Example 1:

```
cout << format("{:%T}", -10'000s);           // prints: -02:46:40
cout << format("{:%H:%M:%S}", -10'000s);     // prints: -02:46:40
cout << format("minutes {:%M, hours %H, seconds %S}", -10'000s);
                                              // prints: minutes -46, hours 02, seconds 40
```

— end example]

- ⁵ Unless explicitly requested, the result of formatting a chrono type does not contain time zone abbreviation and time zone offset information. If the information is available, the conversion specifiers `%Z` and `%z` will format this information (respectively).

[Note 1: If the information is not available and a `%Z` or `%z` conversion specifier appears in the *chrono-format-spec*, an exception of type `format_error` is thrown, as described above. — end note]

- ⁶ If the type being formatted does not contain the information that the format flag needs, an exception of type `format_error` is thrown.

[*Example 2*: A `duration` does not contain enough information to format as a `weekday`. — *end example*]

However, if a flag refers to a “time of day” (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is interpreted as the time of day elapsed since midnight.

Table 101 — Meaning of conversion specifiers [tab:time.format.spec]

Specifier	Replacement
<code>%a</code>	The locale’s abbreviated weekday name. If the value does not contain a valid weekday, an exception of type <code>format_error</code> is thrown.
<code>%A</code>	The locale’s full weekday name. If the value does not contain a valid weekday, an exception of type <code>format_error</code> is thrown.
<code>%b</code>	The locale’s abbreviated month name. If the value does not contain a valid month, an exception of type <code>format_error</code> is thrown.
<code>%B</code>	The locale’s full month name. If the value does not contain a valid month, an exception of type <code>format_error</code> is thrown.
<code>%c</code>	The locale’s date and time representation. The modified command <code>%Ec</code> produces the locale’s alternate date and time representation.
<code>%C</code>	The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with 0. The modified command <code>%EC</code> produces the locale’s alternative representation of the century.
<code>%d</code>	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with 0. The modified command <code>%0d</code> produces the locale’s alternative representation.
<code>%D</code>	Equivalent to <code>%m/%d/%y</code> .
<code>%e</code>	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command <code>%0e</code> produces the locale’s alternative representation.
<code>%F</code>	Equivalent to <code>%Y-%m-%d</code> .
<code>%g</code>	The last two decimal digits of the ISO week-based year. If the result is a single digit it is prefixed by 0.
<code>%G</code>	The ISO week-based year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits.
<code>%h</code>	Equivalent to <code>%b</code> .
<code>%H</code>	The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command <code>%0H</code> produces the locale’s alternative representation.
<code>%I</code>	The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command <code>%0I</code> produces the locale’s alternative representation.
<code>%j</code>	If the type being formatted is a specialization of <code>duration</code> , the decimal number of days without padding. Otherwise, the day of the year as a decimal number. Jan 1 is 001. If the result is less than three digits, it is left-padded with 0 to three digits.
<code>%m</code>	The month as a decimal number. Jan is 01. If the result is a single digit, it is prefixed with 0. The modified command <code>%0m</code> produces the locale’s alternative representation.
<code>%M</code>	The minute as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command <code>%0M</code> produces the locale’s alternative representation.
<code>%n</code>	A new-line character.
<code>%p</code>	The locale’s equivalent of the AM/PM designations associated with a 12-hour clock.
<code>%q</code>	The duration’s unit suffix as specified in 29.5.11 .
<code>%Q</code>	The duration’s numeric value (as if extracted via <code>.count()</code>).
<code>%r</code>	The locale’s 12-hour clock time.
<code>%R</code>	Equivalent to <code>%H:%M</code> .

Table 101 — Meaning of conversion specifiers (continued)

Specifier	Replacement
%S	Seconds as a decimal number. If the number of seconds is less than 10, the result is prefixed with 0. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command %0S produces the locale's alternative representation.
%t	A horizontal-tab character.
%T	Equivalent to %H:%M:%S.
%u	The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %0u produces the locale's alternative representation.
%U	The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %0U produces the locale's alternative representation.
%V	The ISO week-based week number as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %0V produces the locale's alternative representation.
%w	The weekday as a decimal number (0-6), where Sunday is 0. The modified command %0w produces the locale's alternative representation.
%W	The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %0W produces the locale's alternative representation.
%x	The locale's date representation. The modified command %Ex produces the locale's alternate date representation.
%X	The locale's time representation. The modified command %EX produces the locale's alternate time representation.
%y	The last two decimal digits of the year. If the result is a single digit it is prefixed by 0. The modified command %0y produces the locale's alternative representation. The modified command %Ey produces the locale's alternative representation of offset from %EC (year only).
%Y	The year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits. The modified command %EY produces the locale's alternative full year representation.
%z	The offset from UTC as specified in ISO 8601-1:2019, subclause 5.3.4.1. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands %Ez and %0z insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type <code>format_error</code> is thrown.
%Z	The time zone abbreviation. If the time zone abbreviation is not available, an exception of type <code>format_error</code> is thrown.
%%	A % character.

⁷ If the `chrono-specs` is omitted, the chrono object is formatted as if by streaming it to `basic_ostringstream<charT>` `os` with the formatting locale imbued and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

[Example 3:

```
string s = format("{:=>8}", 42ms);      // value of s is "====42ms"
— end example]
```

```
template<class Duration, class charT>
struct formatter<chrono::sys_time<Duration>, charT>;
```

⁸ Remarks: If %Z is used, it is replaced with `STATICALLY-WIDEN<charT>"UTC"`. If %z (or a modified variant of %z) is used, an offset of 0min is formatted.

```

template<class Duration, class charT>
struct formatter<chrono::utc_time<Duration>, charT>;
9   Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("UTC"). If %z (or a modified
      variant of %z) is used, an offset of 0min is formatted. If the argument represents a time during a
      positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is
      STATICALLY-WIDEN<charT>("60").

template<class Duration, class charT>
struct formatter<chrono::tai_time<Duration>, charT>;
10  Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("TAI"). If %z (or a modified
      variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to
      those formatted by a sys_time initialized with
      sys_time<Duration>{tp.time_since_epoch()} -
      (sys_days{1970y/January/1} - sys_days{1958y/January/1})

template<class Duration, class charT>
struct formatter<chrono::gps_time<Duration>, charT>;
11   Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("GPS"). If %z (or a modified
      variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to
      those formatted by a sys_time initialized with
      sys_time<Duration>{tp.time_since_epoch()} +
      (sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})

template<class Duration, class charT>
struct formatter<chrono::file_time<Duration>, charT>;
12   Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("UTC"). If %z (or a modified
      variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to
      those formatted by a sys_time initialized with clock_cast<system_clock>(t), or by a utc_time
      initialized with clock_cast<utc_clock>(t), where t is the first argument to format.

template<class Duration, class charT>
struct formatter<chrono::local_time<Duration>, charT>;
13   Remarks: If %Z, %z, or a modified version of %z is used, an exception of type format_error is thrown.
      template<class Duration> struct local-time-format-t {           // exposition only
          local_time<Duration> time;                                // exposition only
          const string* abbrev;                                     // exposition only
          const seconds* offset_sec;                               // exposition only
      };
      template<class Duration>
      local-time-format-t<Duration>
      local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
                        const seconds* offset_sec = nullptr);

14   Returns: {time, abbrev, offset_sec}.

template<class Duration, class charT>
struct formatter<chrono::local-time-format-t<Duration>, charT>;
15   Let f be a local-time-format-t<Duration> object passed to formatter::format.
16   Remarks: If %Z is used, it is replaced with *f.abbrev if f.abbrev is not a null pointer value. If %Z is
      used and f.abbrev is a null pointer value, an exception of type format_error is thrown. If %z (or a
      modified variant of %z) is used, it is formatted with the value of *f.offset_sec if f.offset_sec is
      not a null pointer value. If %z (or a modified variant of %z) is used and f.offset_sec is a null pointer
      value, then an exception of type format_error is thrown.

template<class Duration, class TimeZonePtr, class charT>
struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
  : formatter<chrono::local-time-format-t<Duration>, charT> {
    template<class FormatContext>
    typename FormatContext::iterator

```

```

        format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
};

template<class FormatContext>
typename FormatContext::iterator
format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
17   Effects: Equivalent to:
    sys_info info = tp.get_info();
    return formatter<chrono::local-time-format-t<Duration>, charT>::
        format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);

```

29.13 Parsing

[time.parse]

- 1 Each `parse` overload specified in this subclause calls `from_stream` unqualified, so as to enable argument dependent lookup (6.5.4). In the following paragraphs, let `is` denote an object of type `basic_istream<charT, traits>` and let `I` be `basic_istream<charT, traits>&`, where `charT` and `traits` are template parameters in that context.
- 2 *Recommended practice:* Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by `parse` immovable and preventing stream extraction into an lvalue of such a manipulator type.

```

template<class charT, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp);
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);

```

- 3 Let `F` be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` for the first overload.
- 4 *Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp)
```

 is well-formed when treated as an unevaluated operand (7.2.3).
- 5 *Returns:* A manipulator such that the expression `is >> parse(fmt, tp)` has type `I`, has value `is`, and calls `from_stream(is, F, tp)`.

```

template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp,
      basic_string<charT, traits, Alloc>& abbrev);
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
      basic_string<charT, traits, Alloc>& abbrev);

```

- 6 Let `F` be `fmt` for the first overload and `fmt.c_str()` for the second overload.
- 7 *Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp, addressof(abbrev))
```

 is well-formed when treated as an unevaluated operand (7.2.3).
- 8 *Returns:* A manipulator such that the expression `is >> parse(fmt, tp, abbrev)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev))`.

```

template<class charT, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp, minutes& offset);
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
      minutes& offset);

```

```
    minutes& offset);
```

9 Let F be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` and `Alloc` be `allocator<charT>` for the first overload.

10 *Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
            F, tp,
            declval<basic_string<charT, traits, Alloc>>(),
            &offset)
```

is well-formed when treated as an unevaluated operand ([7.2.3](#)).

11 *Returns:* A manipulator such that the expression `is >> parse(fmt, tp, offset)` has type `I`, has value `is`, and calls:

```
from_stream(is,
            F, tp,
            static_cast<basic_string<charT, traits, Alloc>>(nullptr),
            &offset)
```

```
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp,
      basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
      basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

12 Let F be `fmt` for the first overload and `fmt.c_str()` for the second overload.

13 *Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
            F, tp, addressof(abbrev), &offset)
```

is well-formed when treated as an unevaluated operand ([7.2.3](#)).

14 *Returns:* A manipulator such that the expression `is >> parse(fmt, tp, abbrev, offset)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev), &offset)`.

15 All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%`. Some flags can be modified by `E` or `O`. During parsing each flag interprets characters as parts of date and time types according to [Table 102](#). Some flags can be modified by a width parameter given as a positive decimal integer called out as N below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in [Table 102](#), except for whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

16 If the type being parsed cannot represent the information that the format flag refers to, `is.setstate(ios_base::failbit)` is called.

[*Example 1:* A duration cannot represent a weekday. — *end example*]

However, if a flag refers to a “time of day” (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is parsed as the time of day elapsed since midnight.

17 If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

Table 102 — Meaning of parse flags [tab:time.parse.spec]

Flag	Parsed value
<code>%a</code>	The locale’s full or abbreviated case-insensitive weekday name.
<code>%A</code>	Equivalent to <code>%a</code> .
<code>%b</code>	The locale’s full or abbreviated case-insensitive month name.

Table 102 — Meaning of parse flags (continued)

Flag	Parsed value
%B	Equivalent to %b.
%c	The locale's date and time representation. The modified command %Ec interprets the locale's alternate date and time representation.
%C	The century as a decimal number. The modified command %NC specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %EC interprets the locale's alternative representation of the century.
%d	The day of the month as a decimal number. The modified command %Nd specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0d interprets the locale's alternative representation of the day of the month.
%D	Equivalent to %m/%d/%y.
%e	Equivalent to %d and can be modified like %d.
%F	Equivalent to %Y-%m-%d. If modified with a width <i>N</i> , the width is applied to only %Y.
%g	The last two decimal digits of the ISO week-based year. The modified command %Ng specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.
%G	The ISO week-based year as a decimal number. The modified command %NG specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required.
%h	Equivalent to %b.
%H	The hour (24-hour clock) as a decimal number. The modified command %NH specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OH interprets the locale's alternative representation.
%I	The hour (12-hour clock) as a decimal number. The modified command %NI specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OI interprets the locale's alternative representation.
%j	If the type being parsed is a specialization of duration , a decimal number of days . Otherwise, the day of the year as a decimal number. Jan 1 is 1. In either case, the modified command %Nj specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 3. Leading zeroes are permitted but not required.
%m	The month as a decimal number. Jan is 1. The modified command %Nm specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0m interprets the locale's alternative representation.
%M	The minutes as a decimal number. The modified command %NM specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %0M interprets the locale's alternative representation.
%n	Matches one whitespace character. [Note 1: %n, %t, and a space can be combined to match a wide range of whitespace patterns. For example, "%n " matches one or more whitespace characters, and "%n%t%t" matches one to three whitespace characters. —end note]
%p	The locale's equivalent of the AM/PM designations associated with a 12-hour clock.
%r	The locale's 12-hour clock time.
%R	Equivalent to %H:%M.
%S	The seconds as a decimal number. The modified command %NS specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a long double in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command %0S interprets the locale's alternative representation.

Table 102 — Meaning of parse flags (continued)

Flag	Parsed value
%t	Matches zero or one whitespace characters.
%T	Equivalent to %H:%M:%S.
%u	The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %Nu specifies the maximum number of characters to read. If N is not specified, the default is 1. Leading zeroes are permitted but not required.
%U	The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %NU specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OU interprets the locale's alternative representation.
%V	The ISO week-based week number as a decimal number. The modified command %NV specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required.
%w	The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Nw specifies the maximum number of characters to read. If N is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command %Ow interprets the locale's alternative representation.
%W	The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %NW specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OW interprets the locale's alternative representation.
%x	The locale's date representation. The modified command %Ex interprets the locale's alternate date representation.
%X	The locale's time representation. The modified command %EX interprets the locale's alternate time representation.
%y	The last two decimal digits of the year. If the century is not otherwise specified (e.g., with %C), values in the range [69, 99] are presumed to refer to the years 1969 to 1999, and values in the range [00, 68] are presumed to refer to the years 2000 to 2068. The modified command %Ny specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands %Ey and %Oy interpret the locale's alternative representation.
%Y	The year as a decimal number. The modified command %NY specifies the maximum number of characters to read. If N is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command %EY interprets the locale's alternative representation.
%z	The offset from UTC in the format [+ -]hh[mm]. For example -0430 refers to 4 hours 30 minutes behind UTC, and 04 refers to 4 hours ahead of UTC. The modified commands %Ez and %Oz parse a : between the hours and minutes and render leading zeroes on the hour field optional: [+ -]h[h] [:mm]. For example -04:30 refers to 4 hours 30 minutes behind UTC, and 4 refers to 4 hours ahead of UTC.
%Z	The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic character set (5.3) that are alphanumeric, or one of '_', '/', ' '-' , or '+'.
%%	A % character is extracted.

29.14 Hash support

[time.hash]

```
template<class Rep, class Period> struct hash<chrono::duration<Rep, Period>>;
```

¹ The specialization `hash<chrono::duration<Rep, Period>>` is enabled (22.10.19) if and only if `hash<Rep>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<class Clock, class Duration> struct hash<chrono::time_point<Clock, Duration>>;
```

² The specialization `hash<chrono::time_point<Clock, Duration>>` is enabled (22.10.19) if and only if `hash<Duration>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<chrono::day>;
template<> struct hash<chrono::month>;
template<> struct hash<chrono::year>;
template<> struct hash<chrono::weekday>;
template<> struct hash<chrono::weekday_indexed>;
template<> struct hash<chrono::weekday_last>;
template<> struct hash<chrono::month_day>;
template<> struct hash<chrono::month_day_last>;
template<> struct hash<chrono::month_weekday>;
template<> struct hash<chrono::month_weekday_last>;
template<> struct hash<chrono::year_month>;
template<> struct hash<chrono::year_month_day>;
template<> struct hash<chrono::year_month_day_last>;
template<> struct hash<chrono::year_month_weekday>;
template<> struct hash<chrono::year_month_weekday_last>;
```

- 3 The specializations are enabled (22.10.19).

[*Note 1:* All the `hash<Key>` specializations listed above meet the *Cpp17Cpp17Hash* requirements, even when called on objects `k` of type `Key` such that `k.ok()` is `false`. — *end note*]

```
template<class Duration, class TimeZonePtr>
struct hash<chrono::zoned_time<Duration, TimeZonePtr>>;
```

- 4 The specialization `hash<chrono::zoned_time<Duration, TimeZonePtr>>` is enabled (22.10.19) if and only if `hash<Duration>` is enabled and `hash<TimeZonePtr>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<chrono::leap_second>;
```

- 5 The specialization is enabled (22.10.19).

29.15 Header <ctime> synopsis

[`ctime.syn`]

```
#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {
    using size_t = see 17.2.4;
    using clock_t = see below;
    using time_t = see below;

    struct timespec;
    struct tm;

    clock_t clock();
    double difftime(time_t time1, time_t time0);
    time_t mktime(tm* timeptr);
    time_t time(time_t* timer);
    int timespec_get(timespec* ts, int base);
    char* asctime(const tm* timeptr);
    char* ctime(const time_t* timer);
    tm* gmtime(const time_t* timer);
    tm* localtime(const time_t* timer);
    size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
}
```

¹ The contents of the header <ctime> are the same as the C standard library header <time.h>²³⁸

² The functions `asctime`, `ctime`, `gmtime`, and `localtime` are not required to avoid data races (16.4.6.10).

SEE ALSO: ISO/IEC 9899:2018, 7.27

²³⁸) `strftime` supports the C conversion specifiers C, D, e, F, g, G, h, r, R, t, T, u, V, and z, and the modifiers E and O.

30 Localization library [localization]

30.1 General [localization.general]

- ¹ This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.
- ² The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in [Table 103](#).

Table 103 — Localization library summary [tab:localization.summary]

Subclause	Header
30.3 Locales	<locale>
30.4 Standard locale categories	
30.5 C library locales	<clocale>
30.6 Text encodings identification	<text_encoding>

30.2 Header <locale> synopsis [locale.syn]

```
namespace std {
    // 30.3.1, locale
    class locale;
    template<class Facet> const Facet& use_facet(const locale& loc);
    template<class Facet> bool has_facet(const locale& loc) noexcept;

    // 30.3.3, convenience interfaces
    template<class charT> bool isspace(charT c, const locale& loc);
    template<class charT> bool isprint(charT c, const locale& loc);
    template<class charT> bool iscntrl(charT c, const locale& loc);
    template<class charT> bool isupper(charT c, const locale& loc);
    template<class charT> bool islower(charT c, const locale& loc);
    template<class charT> bool isalpha(charT c, const locale& loc);
    template<class charT> bool isdigit(charT c, const locale& loc);
    template<class charT> bool ispunct(charT c, const locale& loc);
    template<class charT> bool isxdigit(charT c, const locale& loc);
    template<class charT> bool isalnum(charT c, const locale& loc);
    template<class charT> bool isgraph(charT c, const locale& loc);
    template<class charT> bool isblank(charT c, const locale& loc);
    template<class charT> charT toupper(charT c, const locale& loc);
    template<class charT> charT tolower(charT c, const locale& loc);

    // 30.4.2, ctype
    class ctype_base;
    template<class charT> class ctype;
    template<> class ctype<char>;           // specialization
    template<class charT> class ctype_byname;
    class codecvt_base;
    template<class internT, class externT, class stateT> class codecvt;
    template<class internT, class externT, class stateT> class codecvt_byname;

    // 30.4.3, numeric
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
        class num_get;
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
        class num_put;
```

```

template<class charT>
    class numpunct;
template<class charT>
    class numpunct_byname;

// 30.4.5, collation
template<class charT> class collate;
template<class charT> class collate_byname;

// 30.4.6, date and time
class time_base;
template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get;
template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get_byname;
template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put;
template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname;

// 30.4.7, money
class moneypunct_base;
template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class moneypunct_get;
template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class moneypunct_put;
template<class charT, bool Intl = false>
    class moneypunct;
template<class charT, bool Intl = false>
    class moneypunct_byname;

// 30.4.8, message retrieval
class messages_base;
template<class charT> class messages;
template<class charT> class messages_byname;
}

```

¹ The header <locale> defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.²³⁹

30.3 Locales

[locales]

30.3.1 Class locale

[locale]

30.3.1.1 General

[locale.general]

```

namespace std {
    class locale {
    public:
        // 30.3.1.2, types
        // 30.3.1.2.2, class locale::facet
        class facet;
        // 30.3.1.2.3, class locale::id
        class id;
        // 30.3.1.2.1, type locale::category
        using category = int;
        static const category // values assigned here are for exposition only
            none      = 0,
            collate   = 0x010, ctype     = 0x020,
            monetary  = 0x040, numeric   = 0x080,
            time      = 0x100, messages  = 0x200,
            all       = collate | ctype | monetary | numeric | time | messages;

```

²³⁹⁾ In this subclause, the type name tm is an incomplete type that is defined in <ctime> (29.15).

```

// 30.3.1.3, construct/copy/destroy
locale() noexcept;
locale(const locale& other) noexcept;
explicit locale(const char* std_name);
explicit locale(const string& std_name);
locale(const locale& other, const char* std_name, category);
locale(const locale& other, const string& std_name, category);
template<class Facet> locale(const locale& other, Facet* f);
locale(const locale& other, const locale& one, category);
~locale(); // not virtual
const locale& operator=(const locale& other) noexcept;

// 30.3.1.4, locale operations
template<class Facet> locale combine(const locale& other) const;
string name() const;
text_encoding encoding() const;

bool operator==(const locale& other) const;

template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
                 const basic_string<charT, traits, Allocator>& s2) const;

// 30.3.1.6, global locale objects
static locale global(const locale&);
static const locale& classic();
};

}

```

- ¹ Class `locale` implements a type-safe polymorphic set of facets, indexed by facet *type*. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.
- ² Access to the facets of a locale is via two function templates, `use_facet<>` and `has_facet<>`.
- ³ [Example 1: An iostream `operator<<` can be implemented as:²⁴⁰

```

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
    typename basic_ostream<charT, traits>::sentry cerberos(s);
    if (cerberos) {
        tm tmbuf; d.extract(tmbuf);
        bool failed =
            use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(s.getloc()).put(s, s.fill(), &tmbuf, 'x').failed();
        if (failed)
            s.setstate(s.badbit); // can throw
    }
    return s;
}

— end example]

```

- ⁴ In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets.
- ⁵ [Note 1: All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:

(5.1) — A member operator template

```
operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)
```

is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.

²⁴⁰ Note that in the call to `put`, the stream is implicitly converted to an `ostreambuf_iterator<charT, traits>`.

(5.2) — Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c, loc)`. (This eases upgrading existing extractors (31.7.5.3).)

— end note]

- 6 Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.
- 7 In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.
- 8 A `locale` constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "*".
- 9 Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.4.6.10).

30.3.1.2 Types

[`locale.types`]

30.3.1.2.1 Type `locale::category`

[`locale.category`]

```
using category = int;
```

- 1 Valid `category` values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is `true`, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

- 2 `locale` member functions expecting a `category` argument require one of the `category` values defined above, or the union of two or more such values. Such a `category` value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 104.

Table 104 — Locale category facets [tab:`locale.category.facets`]

Category	Includes facets
collate	<code>collate<char>, collate<wchar_t></code>
ctype	<code>ctype<char>, ctype<wchar_t></code> <code>codecvt<char, char, mbstate_t></code> <code>codecvt<char16_t, char8_t, mbstate_t></code> <code>codecvt<char32_t, char8_t, mbstate_t></code> <code>codecvt<wchar_t, char, mbstate_t></code>
monetary	<code>moneypunct<char>, moneypunct<wchar_t></code> <code>moneypunct<char, true>, moneypunct<wchar_t, true></code> <code>money_get<char>, money_get<wchar_t></code> <code>money_put<char>, money_put<wchar_t></code>
numeric	<code>numpunct<char>, numpunct<wchar_t></code> <code>num_get<char>, num_get<wchar_t></code> <code>num_put<char>, num_put<wchar_t></code>
time	<code>time_get<char>, time_get<wchar_t></code> <code>time_put<char>, time_put<wchar_t></code>
messages	<code>messages<char>, messages<wchar_t></code>

- 3 For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 104, `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.

- ⁴ An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in [Table 105](#).

Table 105 — Required specializations [tab:locale.spec]

Category	Includes facets
collate	<code>collate_byname<char>, collate_byname<wchar_t></code>
ctype	<code>ctype_byname<char>, ctype_byname<wchar_t></code> <code>codecvt_byname<char, char, mbstate_t></code> <code>codecvt_byname<char16_t, char8_t, mbstate_t></code> <code>codecvt_byname<char32_t, char8_t, mbstate_t></code> <code>codecvt_byname<wchar_t, char, mbstate_t></code>
monetary	<code>moneypunct_byname<char, International></code> <code>moneypunct_byname<wchar_t, International></code> <code>money_get<C, InputIterator></code> <code>money_put<C, OutputIterator></code>
numeric	<code>numpunct_byname<char>, numpunct_byname<wchar_t></code> <code>num_get<C, InputIterator>, num_put<C, OutputIterator></code>
time	<code>time_get<char, InputIterator></code> <code>time_get_byname<char, InputIterator></code> <code>time_get<wchar_t, InputIterator></code> <code>time_get_byname<wchar_t, InputIterator></code> <code>time_put<char, OutputIterator></code> <code>time_put_byname<char, OutputIterator></code> <code>time_put<wchar_t, OutputIterator></code> <code>time_put_byname<wchar_t, OutputIterator></code>
messages	<code>messages_byname<char>, messages_byname<wchar_t></code>

- ⁵ The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(1)` only for facet F of types `numpunct<charT>` and `ctype<charT>`, and for locale l the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.
- ⁶ In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the *Cpp17InputIterator* requirements or *Cpp17OutputIterator* requirements, respectively ([25.3](#)). A template parameter with name C represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a `bool` parameter.

30.3.1.2.2 Class `locale::facet`

[`locale.facet`]

```
namespace std {
    class locale::facet {
        protected:
            explicit facet(size_t refs = 0);
            virtual ~facet();
            facet(const facet&) = delete;
            void operator=(const facet&) = delete;
    };
}
```

¹ Class `facet` is the base class for locale feature sets. A class is a *facet* if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:²⁴¹

```
static ::std::locale::id id;
```

² Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit

²⁴¹) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.

or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.

- 3 The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.
- 4 Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are *explicit*, preventing their participation in implicit conversions.
- 5 For some standard facets a standard “`..._byname`” class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no “`..._byname`” version of a facet, the base class implements named locale semantics itself by reference to other facets.

30.3.1.2.3 Class `locale::id`

[`locale.id`]

```
namespace std {
    class locale::id {
    public:
        id();
        void operator=(const id&) = delete;
        id(const id&) = delete;
    };
}
```

- 1 The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.
- 2 [Note 1: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet's `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.9.3.2). —end note]

30.3.1.3 Constructors and destructor

[`locale.cons`]

```
locale() noexcept;
```

- 1 *Effects:* Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.
[Note 1: This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`. —end note]

```
explicit locale(const char* std_name);
```

- 2 *Effects:* Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

- 3 *Throws:* `runtime_error` if the argument is not valid, or is null.

- 4 *Remarks:* The set of valid string argument values is "C", "", and any implementation-defined values.

```
explicit locale(const string& std_name);
```

- 5 *Effects:* Equivalent to `locale(std_name.c_str())`.

```
locale(const locale& other, const char* std_name, category cats);
```

- 6 *Preconditions:* `cats` is a valid `category` value (30.3.1.2.1).

- 7 *Effects:* Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

- 8 *Throws:* `runtime_error` if the second argument is not valid, or is null.

- 9 *Remarks:* The locale has a name if and only if `other` has a name.

```

locale(const locale& other, const string& std_name, category cats);
10   Effects: Equivalent to locale(other, std_name.c_str(), cats).

template<class Facet> locale(const locale& other, Facet* f);
11   Effects: Constructs a locale incorporating all facets from the first argument except that of type Facet, and installs the second argument as the remaining facet. If f is null, the resulting object is a copy of other.
12   Remarks: If f is null, the resulting locale has the same name as other. Otherwise, the resulting locale has no name.

locale(const locale& other, const locale& one, category cats);
13   Preconditions: cats is a valid category value.
14   Effects: Constructs a locale incorporating all facets from the first argument except those that implement cats, which are instead incorporated from the second argument.
15   Remarks: If cats is equal to locale::none, the resulting locale has a name if and only if the first argument has a name. Otherwise, the resulting locale has a name if and only if the first two arguments both have names.

const locale& operator=(const locale& other) noexcept;
16   Effects: Creates a copy of other, replacing the current value.
17   Returns: *this.

```

30.3.1.4 Members

[**locale.members**]

```

template<class Facet> locale combine(const locale& other) const;
1   Effects: Constructs a locale incorporating all facets from *this except for that one facet of other that is identified by Facet.
2   Returns: The newly created locale.
3   Throws: runtime_error if has_facet<Facet>(other) is false.
4   Remarks: The resulting locale has no name.

string name() const;
5   Returns: The name of *this, if it has one; otherwise, the string "*".

text_encoding encoding() const;
6   Mandates: CHAR_BIT == 8 is true.
7   Returns: A text_encoding object representing the implementation-defined encoding scheme associated with the locale *this.

```

30.3.1.5 Operators

[**locale.operators**]

```

bool operator==(const locale& other) const;
1   Returns: true if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; false otherwise.

template<class charT, class traits, class Allocator>
  bool operator()(const basic_string<charT, traits, Allocator>& s1,
                  const basic_string<charT, traits, Allocator>& s2) const;
2   Effects: Compares two strings according to the collate<charT> facet.
3   Returns:
    use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
                                                s2.data(), s2.data() + s2.size()) < 0
4   Remarks: This member operator template (and therefore locale itself) meets the requirements for a comparator predicate template argument (Clause 27) applied to strings.

```

5 [Example 1: A vector of strings `v` can be collated according to collation rules in locale `loc` simply by (27.8.2, 24.3.11):

```
std::sort(v.begin(), v.end(), loc);
— end example]
```

30.3.1.6 Static members

[`locale.statics`]

```
static locale global(const locale& loc);
```

1 *Effects*: Sets the global locale to its argument. Causes future calls to the constructor `locale()` to return a copy of the argument. If the argument has a name, does

```
setlocale(LC_ALL, loc.name().c_str());
```

otherwise, the effect on the C locale, if any, is implementation-defined.

2 *Returns*: The previous value of `locale()`.

3 *Remarks*: No library function other than `locale::global()` affects the value returned by `locale()`.

[Note 1: See 30.5 for data race considerations when `setlocale` is invoked. — end note]

```
static const locale& classic();
```

4 The "C" locale.

5 *Returns*: A locale that implements the classic "C" locale semantics, equivalent to the value `locale("C")`.

6 *Remarks*: This locale, its facets, and their member functions, do not change with time.

30.3.2 locale globals

[`locale.global.templates`]

```
template<class Facet> const Facet& use_facet(const locale& loc);
```

1 *Mandates*: `Facet` is a facet class whose definition contains the public static member `id` as defined in 30.3.1.2.2.

2 *Returns*: A reference to the corresponding facet of `loc`, if present.

3 *Throws*: `bad_cast` if `has_facet<Facet>(loc)` is `false`.

4 *Remarks*: The reference returned remains valid at least as long as any copy of `loc` exists.

```
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

5 *Returns*: `true` if the facet requested is present in `loc`; otherwise `false`.

30.3.3 Convenience interfaces

[`locale.convenience`]

30.3.3.1 Character classification

[`classification`]

```
template<class charT> bool isspace (charT c, const locale& loc);
```

```
template<class charT> bool isprint (charT c, const locale& loc);
```

```
template<class charT> bool iscntrl (charT c, const locale& loc);
```

```
template<class charT> bool isupper (charT c, const locale& loc);
```

```
template<class charT> bool islower (charT c, const locale& loc);
```

```
template<class charT> bool isalpha (charT c, const locale& loc);
```

```
template<class charT> bool isdigit (charT c, const locale& loc);
```

```
template<class charT> bool ispunct (charT c, const locale& loc);
```

```
template<class charT> bool isxdigit(charT c, const locale& loc);
```

```
template<class charT> bool isalnum (charT c, const locale& loc);
```

```
template<class charT> bool isgraph (charT c, const locale& loc);
```

```
template<class charT> bool isblank (charT c, const locale& loc);
```

1 Each of these functions `isF` returns the result of the expression:

```
use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
```

where `F` is the `ctype_base::mask` value corresponding to that function (30.4.2).²⁴²

²⁴²) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>>::is`.

30.3.3.2 Character conversions

[conversions.character]

```
template<class charT> charT toupper(charT c, const locale& loc);
1   Returns: use_facet<ctype<charT>>(loc).toupper(c);

template<class charT> charT tolower(charT c, const locale& loc);
2   Returns: use_facet<ctype<charT>>(loc).tolower(c).
```

30.4 Standard locale categories

[locale.categories]

30.4.1 General

[locale.categories.general]

- 1 Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators << and >>, as members put() and get(), respectively. Each such member function takes an ios_base& argument whose members flags(), precision(), and width(), specify the format of the corresponding datum (31.5.2). Those functions which need to use other facets call its member getloc() to retrieve the locale imbued there. Formatting facets use the character argument fill to fill out the specified width where necessary.
- 2 The put() members make no provision for error reporting. (Any failures of the OutputIterator argument can be extracted from the returned iterator.) The get() members take an ios_base::iostate& argument whose value they ignore, but set to ios_base::failbit in case of a parse error.
- 3 Within subclause 30.4 it is unspecified whether one virtual function calls another virtual function.

30.4.2 The ctype category

[category.ctype]

30.4.2.1 General

[category.ctype.general]

```
namespace std {
    class ctype_base {
        public:
            using mask = see below;

            // numeric values are for exposition only.
            static const mask space = 1 << 0;
            static const mask print = 1 << 1;
            static const mask cntrl = 1 << 2;
            static const mask upper = 1 << 3;
            static const mask lower = 1 << 4;
            static const mask alpha = 1 << 5;
            static const mask digit = 1 << 6;
            static const mask punct = 1 << 7;
            static const mask xdigit = 1 << 8;
            static const mask blank = 1 << 9;
            static const mask alnum = alpha | digit;
            static const mask graph = alnum | punct;
    };
}
```

¹ The type mask is a bitmask type (16.3.3.3.3).

30.4.2.2 Class template ctype

[locale.ctype]

30.4.2.2.1 General

[locale.ctype.general]

```
namespace std {
    template<class charT>
    class ctype : public locale::facet, public ctype_base {
        public:
            using char_type = charT;

            explicit ctype(size_t refs = 0);

            bool is(mask m, charT c) const;
            const charT* is(const charT* low, const charT* high, mask* vec) const;
            const charT* scan_is(mask m, const charT* low, const charT* high) const;
            const charT* scan_not(mask m, const charT* low, const charT* high) const;
    };
}
```

```

    charT      toupper(charT c) const;
    const charT* toupper(charT* low, const charT* high) const;
    charT      tolower(charT c) const;
    const charT* tolower(charT* low, const charT* high) const;

    charT      widen(char c) const;
    const char* widen(const char* low, const char* high, charT* to) const;
    char      narrow(charT c, char dfault) const;
    const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

    static locale::id id;

protected:
    ~ctype();
    virtual bool      do_is(mask m, charT c) const;
    virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
    virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
    virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
    virtual charT      do_toupper(charT) const;
    virtual const charT* do_toupper(charT* low, const charT* high) const;
    virtual charT      do_tolower(charT) const;
    virtual const charT* do_tolower(charT* low, const charT* high) const;
    virtual charT      do_widen(char) const;
    virtual const char* do_widen(const char* low, const char* high, charT* dest) const;
    virtual char      do_narrow(charT, char dfault) const;
    virtual const charT* do_narrow(const charT* low, const charT* high,
                                  char dfault, char* dest) const;
};

}

```

- ¹ Class `ctype` encapsulates the C library `<cctype>` features. `istream` members are required to use `ctype<>` for character classing during input parsing.
- ² The specializations required in [Table 104 \(30.3.1.2.1\)](#), namely `ctype<char>` and `ctype<wchar_t>`, implement character classing appropriate to the implementation's native character set.

30.4.2.2.2 ctype members

[`locale.ctype.members`]

```

bool      is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;

1   Returns: do_is(m, c) or do_is(low, high, vec).

const charT* scan_is(mask m, const charT* low, const charT* high) const;
2   Returns: do_scan_is(m, low, high).

const charT* scan_not(mask m, const charT* low, const charT* high) const;
3   Returns: do_scan_not(m, low, high).

charT      toupper(charT) const;
const charT* toupper(charT* low, const charT* high) const;

4   Returns: do_toupper(c) or do_toupper(low, high).

charT      tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;

5   Returns: do_tolower(c) or do_tolower(low, high).

charT      widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;

6   Returns: do_widen(c) or do_widen(low, high, to).

char      narrow(charT c, char dfault) const;
const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

7   Returns: do_narrow(c, dfault) or do_narrow(low, high, dfault, to).

```

30.4.2.2.3 ctype virtual functions

[locale.ctype.virtuals]

```
bool      do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;
```

1 *Effects:* Classifies a character or sequence of characters. For each argument character, identifies a value M of type `ctype_base::mask`. The second form identifies a value M of type `ctype_base::mask` for each *p where (`low <= p && p < high`), and places it into `vec[p - low]`.

2 *Returns:* The first form returns the result of the expression (`M & m`) != 0; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```
const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
```

3 *Effects:* Locates a character in a buffer that conforms to a classification m.

4 *Returns:* The smallest pointer p in the range [low,high) such that `is(m, *p)` would return `true`; otherwise, returns `high`.

```
const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
```

5 *Effects:* Locates a character in a buffer that fails to conform to a classification m.

6 *Returns:* The smallest pointer p, if any, in the range [low,high) such that `is(m, *p)` would return `false`; otherwise, returns `high`.

```
charT      do_toupper(charT c) const;
```

```
const charT* do_toupper(charT* low, const charT* high) const;
```

7 *Effects:* Converts a character or characters to upper case. The second form replaces each character *p in the range [low,high) for which a corresponding upper-case character exists, with that character.

8 *Returns:* The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT      do_tolower(charT c) const;
```

```
const charT* do_tolower(charT* low, const charT* high) const;
```

9 *Effects:* Converts a character or characters to lower case. The second form replaces each character *p in the range [low,high) and for which a corresponding lower-case character exists, with that character.

10 *Returns:* The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT      do_widen(char c) const;
```

```
const char* do_widen(const char* low, const char* high, charT* dest) const;
```

11 *Effects:* Applies the simplest reasonable transformation from a `char` value or sequence of `char` values to the corresponding `charT` value or values.²⁴³ The only characters for which unique transformations are required are those in the basic character set (5.3).

For any named `ctype` category with a `ctype<charT>` facet `ctc` and valid `ctype_base::mask` value M, (`ctc.is(M, c) || !is(M, do_widen(c))`) is `true`.²⁴⁴

The second form transforms each character *p in the range [low,high), placing the result in `dest[p - low]`.

12 *Returns:* The first form returns the transformed value. The second form returns `high`.

```
char      do_narrow(charT c, char dfault) const;
```

```
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;
```

13 *Effects:* Applies the simplest reasonable transformation from a `charT` value or sequence of `charT` values to the corresponding `char` value or values.

For any character c in the basic character set (5.3) the transformation is such that

```
do_widen(do_narrow(c, 0)) == c
```

²⁴³) The parameter c of `do_widen` is intended to accept values derived from *character-literals* for conversion to the locale's encoding.

²⁴⁴) In other words, the transformed character is not a member of any character classification that c is not also a member of.

For any named `ctype` category with a `ctype<char>` facet `ctc` however, and `ctype_base::mask` value `M`,

```
(is(M, c) || !ctc.is(M, do_narrow(c, dfault)) )
```

is `true` (unless `do_narrow` returns `dfault`). In addition, for any digit character `c`, the expression `(do_narrow(c, dfault) - '0')` evaluates to the digit value of the character. The second form transforms each character `*p` in the range `[low,high]`, placing the result (or `dfault` if no simple transformation is readily available) in `dest[p - low]`.

¹⁴ *Returns:* The first form returns the transformed value; or `dfault` if no mapping is readily available. The second form returns `high`.

30.4.2.3 Class template `ctype_byname`

[`locale.ctypebyname`]

```
namespace std {
    template<class charT>
    class ctype_byname : public ctype<charT> {
        public:
            using mask = typename ctype<charT>::mask;
            explicit ctype_byname(const char*, size_t refs = 0);
            explicit ctype_byname(const string&, size_t refs = 0);

        protected:
            ~ctype_byname();
    };
}
```

30.4.2.4 `ctype<char>` specialization

[`facet.ctype.special`]

30.4.2.4.1 General

[`facet.ctype.special.general`]

```
namespace std {
    template<>
    class ctype<char> : public locale::facet, public ctype_base {
        public:
            using char_type = char;

            explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

            bool is(mask m, char c) const;
            const char* is(const char* low, const char* high, mask* vec) const;
            const char* scan_is(mask m, const char* low, const char* high) const;
            const char* scan_not(mask m, const char* low, const char* high) const;

            char toupper(char c) const;
            const char* toupper(char* low, const char* high) const;
            char tolower(char c) const;
            const char* tolower(char* low, const char* high) const;

            char widen(char c) const;
            const char* widen(const char* low, const char* high, char* to) const;
            char narrow(char c, char dfault) const;
            const char* narrow(const char* low, const char* high, char dfault, char* to) const;

            static locale::id id;
            static const size_t table_size = implementation-defined;

            const mask* table() const noexcept;
            static const mask* classic_table() noexcept;

        protected:
            ~ctype();
            virtual char do_toupper(char c) const;
            virtual const char* do_toupper(char* low, const char* high) const;
            virtual char do_tolower(char c) const;
            virtual const char* do_tolower(char* low, const char* high) const;
    };
}
```

```

        virtual char      do_widen(char c) const;
        virtual const char* do_widen(const char* low, const char* high, char* to) const;
        virtual char      do_narrow(char c, char dfault) const;
        virtual const char* do_narrow(const char* low, const char* high,
                                      char dfault, char* to) const;
    };
}

```

- ¹ A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.²⁴⁵ The implementation-defined value of member `table_size` is at least 256.

30.4.2.4.2 Destructor

[facet.ctype.char.dtor]

`~ctype();`

- ¹ *Effects:* If the constructor's first argument was nonzero, and its second argument was `true`, does `delete [] table()`.

30.4.2.4.3 Members

[facet.ctype.char.members]

- ¹ In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table() [v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

`explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);`

- ² *Preconditions:* Either `tbl == nullptr` is `true` or `[tbl, tbl+table_size)` is a valid range.

- ³ *Effects:* Passes its `refs` argument to its base class constructor.

`bool is(mask m, char c) const;`
`const char* is(const char* low, const char* high, mask* vec) const;`

- ⁴ *Effects:* The second form, for all `*p` in the range `[low,high)`, assigns into `vec[p - low]` the value `table() [(unsigned char)*p]`.

- ⁵ *Returns:* The first form returns `table() [(unsigned char)c] & m`; the second form returns `high`.

`const char* scan_is(mask m, const char* low, const char* high) const;`

- ⁶ *Returns:* The smallest `p` in the range `[low,high)` such that

`table() [(unsigned char) *p] & m`

is `true`.

`const char* scan_not(mask m, const char* low, const char* high) const;`

- ⁷ *Returns:* The smallest `p` in the range `[low,high)` such that

`table() [(unsigned char) *p] & m`

is `false`.

`char toupper(char c) const;`
`const char* toupper(char* low, const char* high) const;`

- ⁸ *Returns:* `do_toupper(c)` or `do_toupper(low, high)`, respectively.

`char tolower(char c) const;`
`const char* tolower(char* low, const char* high) const;`

- ⁹ *Returns:* `do_tolower(c)` or `do_tolower(low, high)`, respectively.

`char widen(char c) const;`
`const char* widen(const char* low, const char* high, char* to) const;`

- ¹⁰ *Returns:* `do_widen(c)` or `do_widen(low, high, to)`, respectively.

²⁴⁵ Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.

```

char      narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;
11     Returns: do_narrow(c, dfault) or do_narrow(low, high, dfault, to), respectively.

const mask* table() const noexcept;
12     Returns: The first constructor argument, if it was nonzero, otherwise classic_table().

```

30.4.2.4.4 Static members

[facet ctype char statics]

```
static const mask* classic_table() noexcept;
```

¹ Returns: A pointer to the initial element of an array of size table_size which represents the classifications of characters in the "C" locale.

30.4.2.4.5 Virtual functions

[facet ctype char virtuals]

```

char      do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char      do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;

virtual char      do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char      do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high,
                           char dfault, char* to) const;

```

¹ These functions are described identically as those members of the same name in the ctype class template (30.4.2.2).

30.4.2.5 Class template codecvt

[locale.codecvt]

30.4.2.5.1 General

[locale.codecvt.general]

```

namespace std {
    class codecvt_base {
    public:
        enum result { ok, partial, error, noconv };
    };

    template<class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
    public:
        using intern_type = internT;
        using extern_type = externT;
        using state_type = stateT;

        explicit codecvt(size_t refs = 0);

        result out(
            stateT& state,
            const internT* from, const internT* from_end, const internT*& from_next,
            externT* to,         externT* to_end,         externT*& to_next) const;

        result unshift(
            stateT& state,
            externT* to,         externT* to_end,         externT*& to_next) const;

        result in(
            stateT& state,
            const externT* from, const externT* from_end, const externT*& from_next,
            internT* to,         internT* to_end,         internT*& to_next) const;

        int encoding() const noexcept;
        bool always_noconv() const noexcept;
        int length(stateT&, const externT* from, const externT* end, size_t max) const;
        int max_length() const noexcept;
    };
}

```

```

    static locale::id id;

protected:
    ~codecvt();
    virtual result do_out(
        stateT& state,
        const internT* from, const internT* from_end, const internT*& from_next,
        externT* to,           externT* to_end,           externT*& to_next) const;
    virtual result do_in(
        stateT& state,
        const externT* from, const externT* from_end, const externT*& from_next,
        internT* to,           internT* to_end,           internT*& to_next) const;
    virtual result do_unshift(
        stateT& state,
        externT* to,           externT* to_end,           externT*& to_next) const;

    virtual int do_encoding() const noexcept;
    virtual bool do_always_noconv() const noexcept;
    virtual int do_length(stateT&, const externT* from, const externT* end, size_t max) const;
    virtual int do_max_length() const noexcept;
};

}

```

- ¹ The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.
- ² The `stateT` argument selects the pair of character encodings being mapped between.
- ³ The specializations required in [Table 104 \(30.3.1.2.1\)](#) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

30.4.2.5.2 Members

[`locale.codecvt.members`]

```

result out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

1   Returns: do_out(state, from, from_end, from_next, to, to_end, to_next).

result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

2   Returns: do_unshift(state, to, to_end, to_next).

result in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;

3   Returns: do_in(state, from, from_end, from_next, to, to_end, to_next).

int encoding() const noexcept;

4   Returns: do_encoding().

bool always_noconv() const noexcept;

5   Returns: do_always_noconv().

```

```

int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
6   Returns: do_length(state, from, from_end, max).

int max_length() const noexcept;
7   Returns: do_max_length().

```

30.4.2.5.3 Virtual functions

[locale.codecvt.virtuals]

```

result do_out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

result do_in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;

```

1 *Preconditions:* (`from <= from_end && to <= to_end`) is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

2 *Effects:* Translates characters in the source range [`from, from_end`), placing the results in sequential positions starting at destination `to`. Converts no more than (`from_end - from`) source elements, and stores no more than (`to_end - to`) destination elements.

3 Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If returns `noconv`, `internT` and `externT` are the same type and the converted sequence is identical to the input sequence [`from, from_next`). `to_next` is set equal to `to`, the value of `state` is unchanged, and there are no changes to the values in [`to, to_end`).

4 A `codecvt` facet that is used by `basic_filebuf` (31.10) shall have the property that if

`do_out(state, from, from_end, from_next, to, to_end, to_next)`

would return `ok`, where `from != from_end`, then

`do_out(state, from, from + 1, from_next, to, to_end, to_next)`

would also return `ok`, and that if

`do_in(state, from, from_end, from_next, to, to_end, to_next)`

would return `ok`, where `to != to_end`, then

`do_in(state, from, from_end, from_next, to, to + 1, to_next)`

would also return `ok`.²⁴⁶

[Note 1: As a result of operations on `state`, it can return `ok` or `partial` and set `from_next == from` and `to_next != to`. — end note]

5 *Returns:* An enumeration value, as summarized in Table 106.

Table 106 — `do_in/do_out` result values [tab:locale.codecvt.inout]

Value	Meaning
<code>ok</code>	completed the conversion
<code>partial</code>	not all source characters converted
<code>error</code>	encountered a character in [<code>from, from_end</code>) that cannot be converted
<code>noconv</code>	<code>internT</code> and <code>externT</code> are the same type, and input sequence is identical to converted sequence

²⁴⁶) Informally, this means that `basic_filebuf` assumes that the mappings from internal to external characters is 1 to N: that a `codecvt` facet that is used by `basic_filebuf` can translate characters one internal character at a time.

A return value of `partial`, if (`from_next == from_end`), indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

6 *Remarks:* Its operations on `state` are unspecified.

[*Note 2:* This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets. — *end note*]

```
result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

7 *Preconditions:* (`to <= to_end`) is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

8 *Effects:* Places characters starting at `to` that should be appended to terminate a sequence when the current `stateT` is given by `state`.²⁴⁷ Stores no more than (`to_end - to`) destination elements, and leaves the `to_next` pointer pointing one beyond the last element successfully stored.

9 *Returns:* An enumeration value, as summarized in [Table 107](#).

Table 107 — `do_unshift` result values [tab:locale.codecvt.unshift]

Value	Meaning
<code>ok</code>	completed the sequence
<code>partial</code>	space for more than <code>to_end - to</code> destination elements was needed to terminate a sequence given the value of <code>state</code>
<code>error</code>	an unspecified error has occurred
<code>noconv</code>	no termination is needed for this <code>state_type</code>

```
int do_encoding() const noexcept;
```

10 *Returns:* `-1` if the encoding of the `externT` sequence is state-dependent; else the constant number of `externT` characters needed to produce an internal character; or `0` if this number is not a constant.²⁴⁸

```
bool do_always_noconv() const noexcept;
```

11 *Returns:* `true` if `do_in()` and `do_out()` return `noconv` for all valid argument values. `codecvt<char, char, mbstate_t>` returns `true`.

```
int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

12 *Preconditions:* (`from <= from_end`) is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

13 *Effects:* The effect on the `state` argument is as if it called `do_in(state, from, from_end, from, to, to+max, to)` for `to` pointing to a buffer of at least `max` elements.

14 *Returns:* (`from_next-from`) where `from_next` is the largest value in the range [`from, from_end`] such that the sequence of values in the range [`from, from_next`] represents `max` or fewer valid complete characters of type `internT`. The specialization `codecvt<char, char, mbstate_t>`, returns the lesser of `max` and (`from_end-from`).

```
int do_max_length() const noexcept;
```

15 *Returns:* The maximum value that `do_length(state, from, from_end, 1)` can return for any valid range [`from, from_end`] and `stateT` value `state`. The specialization `codecvt<char, char, mbstate_t>::do_max_length()` returns `1`.

30.4.2.6 Class template `codecvt_byname`

[`locale.codecvtbyname`]

²⁴⁷⁾ Typically these will be characters to return the state to `stateT()`.

²⁴⁸⁾ If `encoding()` yields `-1`, then more than `max_length()` `externT` elements can be consumed when producing a single `internT` character, and additional `externT` elements can appear at the end of a sequence after those that yield the final `internT` character.

```

namespace std {
    template<class internT, class externT, class stateT>
    class codecvt_byname : public codecvt<internT, externT, stateT> {
        public:
            explicit codecvt_byname(const char*, size_t refs = 0);
            explicit codecvt_byname(const string&, size_t refs = 0);

        protected:
            ~codecvt_byname();
        };
}

```

30.4.3 The numeric category

[category.numeric]

30.4.3.1 General

[category.numeric.general]

- ¹ The classes `num_get`<> and `num_put`<> handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.²⁴⁹
- 2 All specifications of member functions for `num_put` and `num_get` in the subclauses of 30.4.3 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (30.4), and to its imbued locale for the `numpunct`<> facet to identify all numeric punctuation preferences, and also for the `ctype`<> facet to perform character classification.
- 3 Extractor and inserter members of the standard iostreams use `num_get`<> and `num_put`<> member functions for formatting and parsing numeric values (31.7.5.3.1, 31.7.6.3.1).

30.4.3.2 Class template `num_get`

[locale.num.get]

30.4.3.2.1 General

[locale.num.get.general]

```

namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;

            explicit num_get(size_t refs = 0);

            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, bool& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned short& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned int& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, float& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, void*& v) const;
}

```

²⁴⁹ Parsing "-1" correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.

```

        static locale::id id;

protected:
    ~num_get();
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, bool& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, long long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, unsigned short& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, unsigned int& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, unsigned long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, unsigned long long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, float& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, double& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, long double& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                            ios_base::iostate& err, void*& v) const;
};

}

```

¹ The facet num_get is used to parse numeric values from an input sequence such as an istream.

30.4.3.2.2 Members

[facet.num.get.members]

```

iter_type get(iter_type in, iter_type end, ios_base& str,
            ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
            ios_base::iostate& err, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
            ios_base::iostate& err, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
            ios_base::iostate& err, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
            ios_base::iostate& err, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
            ios_base::iostate& err, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
            ios_base::iostate& err, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
            ios_base::iostate& err, float& val) const;

            ios_base::iostate& err, void*& val) const;

```

¹ Returns: do_get(in, end, str, err, val).

30.4.3.2.3 Virtual functions

[facet.num.get.virtuals]

```

iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned short& val) const;

```

```

iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, void*& val) const;

```

1 *Effects:* Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT>>(loc)`, and `use_facet<numpunct<charT>>(loc)`, where `loc` is `str.getloc()`.

2 The details of this operation occur in three stages

- (2.1) — Stage 1: Determine a conversion specifier
- (2.2) — Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.
- (2.3) — Stage 3: Store results

3 The details of the stages are presented below.

Stage 1: The function initializes local variables via

```

fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);

```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in [Table 108](#). The table is ordered. That is, the first line whose condition is true applies.

Table 108 — Integer conversions [tab:facet.num.get.int]

State	stdio equivalent
basefield == oct	%o
basefield == hex	%X
basefield == 0	%i
signed integral type	%d
unsigned integral type	%u

For conversions to a floating-point type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in [Table 109](#).

Table 109 — Length modifier [tab:facet.num.get.length]

Type	Length modifier
short	h
unsigned short	h
long	l
unsigned long	l
long long	ll
unsigned long long	ll
double	l
long double	L

Stage 2: If `in == end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

```
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
    c = '.';
bool discard =
    ct == use_facet<numpunct<charT>>(loc).thousands_sep()
    && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
```

where the values `src` and `atoms` are defined as if by:

```
static const char src[] = "0123456789abcdefpxABCDEFpx+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of `loc`.

If `discard` is `true`, then if `'.'` has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if `'.'` has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a check is made to determine if `c` is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then `in` is advanced by `++in` and processing returns to the beginning of stage 2.

[*Example 1:* Given an input sequence of "0x1a.bp+07p",

- (3.1) — if the conversion specifier returned by Stage 1 is `%d`, "0" is accumulated;
- (3.2) — if the conversion specifier returned by Stage 1 is `%i`, "0x1a" are accumulated;
- (3.3) — if the conversion specifier returned by Stage 1 is `%g`, "0x1a.bp+07" are accumulated.

In all cases, the remainder is left in the input. — *end example*]

Stage 3: The sequence of `chars` accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header `<cstdlib>`:

- (3.4) — For a signed integer value, the function `strtoll`.
- (3.5) — For an unsigned integer value, the function `strtoull`.
- (3.6) — For a `float` value, the function `strtof`.
- (3.7) — For a `double` value, the function `strtod`.
- (3.8) — For a `long double` value, the function `strtold`.

The numeric value to be stored can be one of:

- (3.9) — zero, if the conversion function does not convert the entire field.
- (3.10) — the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in `val`.
- (3.11) — the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in `val`.
- (3.12) — the converted value, otherwise.

The resultant numeric value is stored in `val`. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to `err`.

⁴ Digit grouping is checked. That is, the positions of discarded separators are examined for consistency with `use_facet<numpunct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to `err`.

⁵ In any case, if stage 2 processing was terminated by the test for `in == end` then `err |= ios_base::eofbit` is performed.

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, bool& val) const;
```

⁶ *Effects:* If `(str.flags()&ios_base::boolalpha) == 0` then input proceeds as it would for a `long` except that if a value is being stored into `val`, the value is determined according to the following: If the value to be stored is 0 then `false` is stored. If the value is 1 then `true` is stored. Otherwise `true` is stored and `ios_base::failbit` is assigned to `err`.

7 Otherwise target sequences are determined “as if” by calling the members `falseename()` and `truename()` of the facet obtained by `use_facet<numpunct<charT>>(str.getloc())`. Successive characters in the range `[in, end)` (see 24.2.4) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator `in` is compared to `end` only when necessary to obtain a character. If a target sequence is uniquely matched, `val` is set to the corresponding value. Otherwise `false` is stored and `ios_base::failbit` is assigned to `err`.

8 The `in` iterator is always left pointing one position beyond the last character successfully matched. If `val` is set, then `err` is set to `str.goodbit`; or to `str.eofbit` if, when seeking another character to match, it is found that `(in == end)`. If `val` is not set, then `err` is set to `str.failbit`; or to `(str.failbit|str.eofbit)` if the reason for the failure was that `(in == end)`.

[Example 2: For targets `true: "a"` and `false: "abb"`, the input sequence `"a"` yields `val == true` and `err == str.eofbit`; the input sequence `"abc"` yields `err = str.failbit`, with `in` ending at the '`c`' element. For targets `true: "1"` and `false: "0"`, the input sequence `"1"` yields `val == true` and `err == str.goodbit`. For empty targets (""), any input sequence yields `err == str.failbit`. — end example]

9 Returns: `in`.

30.4.3.3 Class template num_put

[locale.nm.put]

30.4.3.3.1 General

[locale.nm.put.general]

```
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit num_put(size_t refs = 0);

            iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

            static locale::id id;

        protected:
            ~num_put();
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
    };
}
```

1 The facet `num_put` is used to format numeric values to a character sequence such as an ostream.

30.4.3.3.2 Members

[facet.num.put.members]

```
iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
```

```
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;
1   Returns: do_put(out, str, fill, val).
```

30.4.3.3.3 Virtual functions

[facet.num.put.virtuals]

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;
```

1 *Effects:* Writes characters to the sequence `out`, formatting `val` as desired. In the following description, `loc` names a local variable initialized as

```
locale loc = str.getloc();
```

2 The details of this operation occur in several stages:

(2.1) — Stage 1: Determine a printf conversion specifier `spec` and determine the characters that would be printed by `printf` (31.13) given this conversion specifier for

```
printf(spec, val)
```

assuming that the current locale is the "C" locale.

(2.2) — Stage 2: Adjust the representation by converting each `char` determined by stage 1 to a `charT` using a conversion and values returned by members of `use_facet<num_punct<charT>>(loc)`.

(2.3) — Stage 3: Determine where padding is required.

(2.4) — Stage 4: Insert the sequence into the `out`.

3 Detailed descriptions of each stage follow.

4 *Returns:* `out`.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 110.

Table 110 — Integer conversions [tab:facet.num.put.int]

State	stdio equivalent
<code>basefield == ios_base::oct</code>	<code>%o</code>
<code>(basefield == ios_base::hex) && !uppercase</code>	<code>%x</code>
<code>(basefield == ios_base::hex)</code>	<code>%X</code>
for a <code>signed</code> integral type	<code>%d</code>
for an <code>unsigned</code> integral type	<code>%u</code>

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 111.

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 112.

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 113.

Table 111 — Floating-point conversions [tab:facet.num.put.fp]

State	stdio equivalent
floatfield == ios_base::fixed	%f
floatfield == ios_base::scientific && !uppercase	%e
floatfield == ios_base::scientific	%E
floatfield == (ios_base::fixed ios_base::scientific) && !uppercase	%a
floatfield == (ios_base::fixed ios_base::scientific)	%A
!uppercase	%g
otherwise	%G

Table 112 — Length modifier [tab:facet.num.put.length]

Type	Length modifier
long	l
long long	ll
unsigned long	l
unsigned long long	ll
long double	L
otherwise	none

Table 113 — Numeric conversions [tab:facet.num.put.conv]

Type(s)	State	stdio equivalent
an integral type	showpos	+
	showbase	#
a floating-point type	showpos	+
	showpoint	#

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

Stage 2: Any character `c` other than a decimal point(.) is converted to a `charT` via

```
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet<numpunct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in [30.4.4.1.3](#). Decimal point characters(.) are replaced by `punct.decimal_point()`.

Stage 3: A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding²⁵⁰ is determined according to [Table 114](#).

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough `fill` characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

Stage 4: The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

²⁵⁰) The conversion specification `#o` generates a leading 0 which is *not* a padding character.

Table 114 — Fill padding [tab:facet.num.put.fill]

State	Location
<code>adjustfield == ios_base::left</code>	pad after
<code>adjustfield == ios_base::right</code>	pad before
<code>adjustfield == internal</code> and a sign occurs in the representation	pad after the sign
<code>adjustfield == internal</code> and representation after stage 1 began with 0x or 0X	pad after x or X
<i>otherwise</i>	pad before

`iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;`
 5 *Returns:* If (`str.flags() & ios_base::boolalpha`) == 0 returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```
string_type s =
  val ? use_facet<numpunct<charT>>(loc).truename()
    : use_facet<numpunct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

30.4.4 The numeric punctuation facet

[facet.numpunct]

30.4.4.1 Class template numpunct

[locale.numpunct]

30.4.4.1.1 General

[locale.numpunct.general]

```
namespace std {
  template<class charT>
  class numpunct : public locale::facet {
  public:
    using char_type = charT;
    using string_type = basic_string<charT>

    explicit numpunct(size_t refs = 0);

    char_type decimal_point() const;
    char_type thousands_sep() const;
    string grouping() const;
    string_type truename() const;
    string_type falsename() const;

    static locale::id id;
  protected:
    ~numpunct(); // virtual
    virtual char_type do_decimal_point() const;
    virtual char_type do_thousands_sep() const;
    virtual string do_grouping() const;
    virtual string_type do_truename() const; // for bool
    virtual string_type do_falsename() const; // for bool
  };
}
```

¹ `numpunct<>` specifies numeric punctuation. The specializations required in [Table 104 \(30.3.1.2.1\)](#), namely `numpunct<wchar_t>` and `numpunct<char>`, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to `widen`.

² The syntax for number formats is as follows, where *digit* represents the radix set specified by the `fmtflags` argument value, and *thousands-sep* and *decimal-point* are the results of corresponding `numpunct<charT>` members. Integer values have the format:

intval:
sign_{opt} units

```

sign:
+
-
units:
  digits
  digits thousands-sep units
digits:
  digit digitsopt

```

and floating-point values have:

```

floatval:
  signopt units fractionalopt exponentopt
  signopt decimal-point digits exponentopt

fractional:
  decimal-point digitsopt

exponent:
  e signopt digits

e:
  e
  E

```

where the number of digits between *thousands-seps* is as specified by `do_grouping()`. For parsing, if the *digits* portion contains no thousands-separators, no grouping constraint is applied.

30.4.4.1.2 Members

[facet.numpunct.members]

```

char_type decimal_point() const;
1   Returns: do_decimal_point().

char_type thousands_sep() const;
2   Returns: do_thousands_sep().

string grouping() const;
3   Returns: do_grouping().

string_type truename() const;
string_type falsename() const;
4   Returns: do_truename() or do_falsename(), respectively.

```

30.4.4.1.3 Virtual functions

[facet.numpunct.virtuals]

```

char_type do_decimal_point() const;
1   Returns: A character for use as the decimal radix separator. The required specializations return '.' or
      L'.'.

char_type do_thousands_sep() const;
2   Returns: A character for use as the digit group separator. The required specializations return ',' or
      L','.

string do_grouping() const;
3   Returns: A string vec used as a vector of integer values, in which each element vec[i] represents
      the number of digits251 in the group at position i, starting with position 0 as the rightmost group. If
      vec.size() <= i, the number is the same as group (i - 1); if (i < 0 || vec[i] <= 0 || vec[i]
      == CHAR_MAX), the size of the digit group is unlimited.

4   The required specializations return the empty string, indicating no grouping.

```

²⁵¹) Thus, the string "\003" specifies groups of 3 digits each, and "3" probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of "3".

```
string_type do_truename() const;
string_type do_falsename() const;
```

- 5 *Returns:* A string representing the name of the boolean value `true` or `false`, respectively.
 6 In the base class implementation these names are "true" and "false", or L"true" and L"false".

30.4.4.2 Class template `numpunct_byname`

[`locale.numpunctbyname`]

```
namespace std {
    template<class charT>
    class numpunct_byname : public numpunct<charT> {
        // this class is specialized for char and wchar_t.
    public:
        using char_type = charT;
        using string_type = basic_string<charT>

        explicit numpunct_byname(const char*, size_t refs = 0);
        explicit numpunct_byname(const string&, size_t refs = 0);

    protected:
        ~numpunct_byname();
    };
}
```

30.4.5 The collate category

[`category.collate`]

30.4.5.1 Class template `collate`

[`locale.collate`]

30.4.5.1.1 General

[`locale.collate.general`]

```
namespace std {
    template<class charT>
    class collate : public locale::facet {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>

        explicit collate(size_t refs = 0);

        int compare(const charT* low1, const charT* high1,
                    const charT* low2, const charT* high2) const;
        string_type transform(const charT* low, const charT* high) const;
        long hash(const charT* low, const charT* high) const;

        static locale::id id;

    protected:
        ~collate();
        virtual int do_compare(const charT* low1, const charT* high1,
                              const charT* low2, const charT* high2) const;
        virtual string_type do_transform(const charT* low, const charT* high) const;
        virtual long do_hash (const charT* low, const charT* high) const;
    };
}
```

- ¹ The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms ([Clause 27](#)) and containers operating on strings. The specializations required in [Table 104 \(30.3.1.2.1\)](#), namely `collate<char>` and `collate<wchar_t>`, apply lexicographical ordering ([27.8.11](#)).

- ² Each function compares a string of characters *p in the range [low,high].

30.4.5.1.2 Members

[`locale.collate.members`]

```

int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;
1   Returns: do_compare(low1, high1, low2, high2).

string_type transform(const charT* low, const charT* high) const;
2   Returns: do_transform(low, high).

long hash(const charT* low, const charT* high) const;
3   Returns: do_hash(low, high).

```

30.4.5.1.3 Virtual functions

[locale.collate.virtuals]

```

int do_compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;
1   Returns: 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations required in Table 104 \(30.3.1.2.1\), namely collate<char> and collate<wchar_t>, implement a lexicographical comparison (27.8.11).

string_type do_transform(const charT* low, const charT* high) const;
2   Returns: A basic_string<charT> value that, compared lexicographically with the result of calling transform() on another string, yields the same result as calling do_compare() on the same two strings.252

long do_hash(const charT* low, const charT* high) const;
3   Returns: An integer value equal to the result of calling hash() on any other string for which do_compare() returns 0 (equal) when passed the two strings.

4   Recommended practice: The probability that the result equals that for another string which does not compare equal should be very small, approaching (1.0/numeric_limits<unsigned long>::max()).

```

30.4.5.2 Class template `collate_byname`

[locale.collatebyname]

```

namespace std {
    template<class charT>
    class collate_byname : public collate<charT> {
public:
    using string_type = basic_string<charT>;

    explicit collate_byname(const char*, size_t refs = 0);
    explicit collate_byname(const string&, size_t refs = 0);

protected:
    ~collate_byname();
};

}

```

30.4.6 The time category

[category.time]

30.4.6.1 General

[category.time.general]

¹ Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclauses of [30.4.6](#) only apply to the specializations required in Tables 104 and 105 ([30.3.1.2.1](#)). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in [30.4](#), and the `ctype<>` facet, to determine formatting details.

30.4.6.2 Class template `time_get`

[locale.time.get]

30.4.6.2.1 General

[locale.time.get.general]

```

namespace std {
    class time_base {
public:
    enum dateorder { no_order, dmy, mdy, ymd, ydm };
}

```

²⁵² This function is useful when one string is being compared to many other strings.

```

};

template<class charT, class InputIterator = istreambuf_iterator<charT>>
class time_get : public locale::facet, public time_base {
public:
    using char_type = charT;
    using iter_type = InputIterator;

    explicit time_get(size_t refs = 0);

    dateorder date_order() const { return do_date_order(); }
    iter_type get_time(iter_type s, iter_type end, ios_base& f,
                       ios_base::iostate& err, tm* t) const;
    iter_type get_date(iter_type s, iter_type end, ios_base& f,
                       ios_base::iostate& err, tm* t) const;
    iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
    iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                           ios_base::iostate& err, tm* t) const;
    iter_type get_year(iter_type s, iter_type end, ios_base& f,
                      ios_base::iostate& err, tm* t) const;
    iter_type get(iter_type s, iter_type end, ios_base& f,
                  ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
    iter_type get(iter_type s, iter_type end, ios_base& f,
                  ios_base::iostate& err, tm* t, const char_type* fmt,
                  const char_type* fmtend) const;

    static locale::id id;

protected:
    ~time_get();
    virtual dateorder do_date_order() const;
    virtual iter_type do_get_time(iter_type s, iter_type end, ios_base&,
                                  ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_date(iter_type s, iter_type end, ios_base&,
                                  ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base&,
                                    ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base&,
                                       ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_year(iter_type s, iter_type end, ios_base&,
                                 ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
                            ios_base::iostate& err, tm* t, char format, char modifier) const;
};

}

```

¹ time_get is used to parse a character sequence, extracting components of a time or date into a tm object. Each get member parses a format as produced by a corresponding format specifier to time_put<>::put. If the sequence being parsed matches the correct format, the corresponding members of the tm argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.²⁵³

² If the end iterator is reached during parsing by any of the get() member functions, the member sets ios_base::eofbit in err.

30.4.6.2.2 Members

[locale.time.get.members]

```
dateorder date_order() const;
1   Returns: do_date_order().
```

²⁵³) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.

```

iter_type get_time(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
2   Returns: do_get_time(s, end, str, err, t).

iter_type get_date(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
3   Returns: do_get_date(s, end, str, err, t).

iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
                       ios_base::iostate& err, tm* t) const;
4   Returns: do_get_weekday(s, end, str, err, t) or do_get_monthname(s, end, str, err, t).

iter_type get_year(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
5   Returns: do_get_year(s, end, str, err, t).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
              tm* t, char format, char modifier = 0) const;
6   Returns: do_get(s, end, f, err, t, format, modifier).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
              tm* t, const char_type* fmt, const char_type* fmtend) const;
7   Preconditions: [fmt,fmtend) is a valid range.

8   Effects: The function starts by evaluating err = ios_base::goodbit. It then enters a loop, reading zero or more characters from s at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:
(8.1) — The expression fmt == fmtend evaluates to true.
(8.2) — The expression err == ios_base::goodbit evaluates to false.
(8.3) — The expression s == end evaluates to true, in which case the function evaluates err = ios_base::eofbit | ios_base::failbit.
(8.4) — The next element of fmt is equal to '%', optionally followed by a modifier character, format, together forming a conversion specification valid for the POSIX function strftime. If the number of elements in the range [fmt,fmtend) is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates err = ios_base::failbit. Otherwise, the function evaluates s = do_get(s, end, f, err, t, format, modifier), where the value of modifier is '\0' when the optional modifier is absent from the conversion specification. If err == ios_base::goodbit holds after the evaluation of the expression, the function increments fmt to point just past the end of the conversion specification and continues looping.
(8.5) — The expression isspace(*fmt, f.getloc()) evaluates to true, in which case the function first increments fmt until fmt == fmtend || !isspace(*fmt, f.getloc()) evaluates to true, then advances s until s == end || !isspace(*s, f.getloc()) is true, and finally resumes looping.
(8.6) — The next character read from s matches the element pointed to by fmt in a case-insensitive comparison, in which case the function evaluates ++fmt, ++s and continues looping. Otherwise, the function evaluates err = ios_base::failbit.
9   [Note 1: The function uses the ctype<charT> facet installed in f's locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. —end note]
10  Returns: s.

```

30.4.6.2.3 Virtual functions

[`locale.time.get.virtuals`]

```
dateorder do_date_order() const;
```

- 1 *Returns:* An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.²⁵⁴ Returns `no_order` if the date format specified by 'x' contains other variable components (e.g., Julian day, week number, week day).

```
iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

- 2 *Effects:* Reads characters starting at `s` until it has extracted those `tm` members, and remaining format characters, used by `time_put<>::put` to produce the format specified by "%H:%M:%S", or until it encounters an error or end of sequence.

- 3 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

```
iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

- 4 *Effects:* Reads characters starting at `s` until it has extracted those `tm` members and remaining format characters used by `time_put<>::put` to produce one of the following formats, or until it encounters an error. The format depends on the value returned by `date_order()` as shown in Table 115.

Table 115 — do_get_date effects [tab:locale.time.get.dogetdate]

date_order()	Format
<code>no_order</code>	"%m%d%y"
<code>dmy</code>	"%d%m%y"
<code>mdy</code>	"%m%d%y"
<code>ymd</code>	"%y%m%d"
<code>ydm</code>	"%y%d%m"

- 5 An implementation may also accept additional implementation-defined formats.

- 6 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

```
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
                        ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
                           ios_base::iostate& err, tm* t) const;
```

- 7 *Effects:* Reads characters starting at `s` until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate `tm` member accordingly.

- 8 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid name.

```
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

- 9 *Effects:* Reads characters starting at `s` until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the `t->tm_year` member accordingly.

- 10 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```
iter_type do_get(iter_type s, iter_type end, ios_base& f,
                 ios_base::iostate& err, tm* t, char format, char modifier) const;
```

- 11 *Preconditions:* `t` points to an object.

- 12 *Effects:* The function starts by evaluating `err = ios_base::goodbit`. It then reads characters starting at `s` until it encounters an error, or until it has extracted and assigned those `tm` members, and any

²⁵⁴) This function is intended as a convenience only, for common formats, and can return `no_order` in valid locales.

remaining format characters, corresponding to a conversion specification appropriate for the POSIX function `strptime`, formed by concatenating '`%`', the `modifier` character, when non-NUL, and the `format` character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to `true` after reading a character the function evaluates `err |= ios_base::eofbit`.

13 For complex conversion specifications such as `%c`, `%x`, or `%X`, or conversion specifications that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `tm` members from the input sequence `[s, end)`, it evaluates `err |= ios_base::eofbit`. In such cases the values of those `tm` members are unspecified and may be outside their valid range.

14 *Returns:* An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given `format` and `modifier`.

15 *Remarks:* It is unspecified whether multiple calls to `do_get()` with the address of the same `tm` object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

30.4.6.3 Class template `time_get_byname`

[`locale.time.getbyname`]

```
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get_byname : public time_get<charT, InputIterator> {
public:
    using dateorder = time_base::dateorder;
    using iter_type = InputIterator;

    explicit time_get_byname(const char*, size_t refs = 0);
    explicit time_get_byname(const string&, size_t refs = 0);

protected:
    ~time_get_byname();
};

}
```

30.4.6.4 Class template `time_put`

[`locale.time.put`]

```
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put : public locale::facet {
public:
    using char_type = charT;
    using iter_type = OutputIterator;

    explicit time_put(size_t refs = 0);

    // the following is implemented in terms of other member functions.
    iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                  const charT* pattern, const charT* pat_end) const;
    iter_type put(iter_type s, ios_base& f, char_type fill,
                  const tm* tmb, char format, char modifier = 0) const;

    static locale::id id;

protected:
    ~time_put();
    virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                            char format, char modifier) const;
};

}
```

30.4.6.4.1 Members

[`locale.time.put.members`]

```
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              const charT* pattern, const charT* pat_end) const;
```

```
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
             char format, char modifier = 0) const;
```

- 1 *Effects:* The first form steps through the sequence from `pattern` to `pat_end`, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to `s` immediately, and each format sequence, as it is identified, results in a call to `do_put`; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character `c` to a `char` value as if by `ct.narrow(c, 0)`, where `ct` is a reference to `ctype<charT>` obtained from `str.getloc()`. The first character of each sequence is equal to `'%`, followed by an optional modifier character `mod`²⁵⁵ and a format specifier character `spec` as defined for the function `strftime`. If no modifier character is present, `mod` is zero. For each valid format sequence identified, calls `do_put(s, str, fill, t, spec, mod)`.
- 2 The second form calls `do_put(s, str, fill, t, format, modifier)`.
- 3 [Note 1: The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. —end note]
- 4 *Returns:* An iterator pointing immediately after the last character produced.

30.4.6.4.2 Virtual functions

[`locale.time.put.virtuals`]

```
iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
                 char format, char modifier) const;
```

- 1 *Effects:* Formats the contents of the parameter `t` into characters placed on the output sequence `s`. Formatting is controlled by the parameters `format` and `modifier`, interpreted identically as the format specifiers in the string argument to the standard library function `strftime()`, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.
- [Note 1: Interpretation of the `modifier` argument is implementation-defined. —end note]
- 2 *Returns:* An iterator pointing immediately after the last character produced.
- [Note 2: The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. —end note]
- 3 *Recommended practice:* Interpretation of the `modifier` should follow POSIX conventions. Implementations should refer to other standards such as POSIX for a specification of the character sequences produced for those specifiers described as depending on the C locale.

30.4.6.5 Class template `time_put_byname`

[`locale.time.putbyname`]

```
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname : public time_put<charT, OutputIterator> {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit time_put_byname(const char*, size_t refs = 0);
            explicit time_put_byname(const string&, size_t refs = 0);

        protected:
            ~time_put_byname();
        };
}
```

30.4.7 The monetary category

[`category.monetary`]

30.4.7.1 General

[`category.monetary.general`]

- 1 These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.
- 2 All specifications of member functions for `money_put` and `money_get` in the subclauses of 30.4.7 only apply to the specializations required in Tables 104 and 105 (30.3.1.2.1). Their members use their `ios_base&`,

²⁵⁵) Although the C programming language defines no modifiers, most vendors do.

`ios_base::iostate&`, and `fill` arguments as described in 30.4, and the `moneypunct<charT>` and `ctype<charT>` facets, to determine formatting details.

30.4.7.2 Class template `money_get`

[`locale.money.get`]

```
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;
            using string_type = basic_string<charT>;
            explicit money_get(size_t refs = 0);

            iter_type get(iter_type s, iter_type end, bool intl,
                          ios_base& f, ios_base::iostate& err,
                          long double& units) const;
            iter_type get(iter_type s, iter_type end, bool intl,
                          ios_base& f, ios_base::iostate& err,
                          string_type& digits) const;

            static locale::id id;
        protected:
            ~money_get();
            virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                                      ios_base::iostate& err, long double& units) const;
            virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                                      ios_base::iostate& err, string_type& digits) const;
    };
}
```

30.4.7.2.1 Members

[`locale.money.get.members`]

```
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, string_type& quant) const;
```

¹ *Returns:* `do_get(s, end, intl, f, err, quant)`.

30.4.7.2.2 Virtual functions

[`locale.money.get.virtuals`]

```
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                  ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                  ios_base::iostate& err, string_type& digits) const;
```

¹ *Effects:* Reads characters from `s` to parse and construct a monetary value according to the format specified by a `moneypunct<charT, Int1>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. If a valid sequence is recognized, does not change `err`; otherwise, sets `err` to `(err|str.failbit)`, or `(err|str.failbit|str.eofbit)` if no more characters are available, and does not change `units` or `digits`. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in `units` or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where `c` is `'-'` or in the range from `'0'` through `'9'` (inclusive)) stored in `digits`.

[*Example 1:* The sequence `$1,056.23` in a common United States locale would yield, for `units`, `105623`, or, for `digits`, `"105623"`. — *end example*]

If `mp.grouping()` indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

- 2 Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no whitespace is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one whitespace character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, whitespace is allowed but not required. If `(str.flags() & str.showbase)` is `false`, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.
- 3 If the first character (if any) in the string `pos` returned by `mp.positive_sign()` or the string `neg` returned by `mp.negative_sign()` is recognized in the position indicated by `sign` in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components.
- [*Example 2: If showbase is off, then for a neg value of "()" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if neg is "-", the "L" in "-100 L" is not consumed. —end example*]
- If `pos` or `neg` is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of `pos` or `neg`, and the result is given the corresponding sign. If the first character of `pos` is equal to the first character of `neg`, or if both strings are empty, the result is given a positive sign.
- 4 Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by²⁵⁶

```
for (int i = 0; i < n; ++i)
    buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

- 5 *Returns:* An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

30.4.7.3 Class template `money_put`

[`locale.money.put`]

```
namespace std {
template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
class money_put : public locale::facet {
public:
    using char_type = charT;
    using iter_type = OutputIterator;
    using string_type = basic_string<charT>;

    explicit money_put(size_t refs = 0);

    iter_type put(iter_type s, bool intl, ios_base& f,
                  char_type fill, long double units) const;
    iter_type put(iter_type s, bool intl, ios_base& f,
                  char_type fill, const string_type& digits) const;

    static locale::id id;

protected:
    ~money_put();
    virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                            long double units) const;
    virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                            const string_type& digits) const;
```

²⁵⁶) The semantics here are different from `ct.narrow`.

```
    };
}
```

30.4.7.3.1 Members

[locale.money.put.members]

```
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

1 >Returns: do_put(s, intl, f, loc, quant).

30.4.7.3.2 Virtual functions

[locale.money.put.virtuals]

```
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, const string_type& digits) const;
```

1 Effects: Writes characters to s according to the format specified by a `moneypunct<charT, Intl>` facet reference mp and the character mapping specified by a `ctype<charT>` facet reference ct obtained from the locale returned by str.getloc(), and str.flags(). The argument units is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%.0Lf", units), buf2)
```

for character buffers buf1 and buf2. If the first character in digits or buf2 is equal to ct.widen('‐'), then the pattern used for formatting is the result of mp.neg_format(); otherwise the pattern is the result of mp.pos_format(). Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in digits or buf2. In digits, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to ct) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls str.width(0).

2 >Returns: An iterator pointing immediately after the last character produced.

3 Remarks: The currency symbol is generated if and only if (str.flags() & str.showbase) is nonzero. If the number of characters generated for the specified format is less than the value returned by str.width() on entry to the function, then copies of fill are inserted as necessary to pad to the specified width. For the value af equal to (str.flags() & str.adjustfield), if (af == str.internal) is true, the fill characters are placed where none or space appears in the formatting pattern; otherwise if (af == str.left) is true, they are placed after the other characters; otherwise, they are placed before the other characters.

[Note 1: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using num_get<>::get. —end note]

30.4.7.4 Class template moneypunct

[locale.moneypunct]

30.4.7.4.1 General

[locale.moneypunct.general]

```
namespace std {
    class money_base {
        public:
            enum part { none, space, symbol, sign, value };
            struct pattern { char field[4]; };
    };

    template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
        public:
            using char_type = charT;
            using string_type = basic_string<charT>

            explicit moneypunct(size_t refs = 0);

            charT      decimal_point() const;
            charT      thousands_sep() const;
            string     grouping()      const;
            string_type curr_symbol() const;
            string_type positive_sign() const;
    };
}
```

```

        string_type negative_sign() const;
        int         frac_digits()   const;
        pattern    pos_format()    const;
        pattern    neg_format()    const;

        static locale::id id;
        static const bool intl = International;

protected:
    ~moneypunct();
    virtual charT      do_decimal_point() const;
    virtual charT      do_thousands_sep() const;
    virtual string     do_grouping()      const;
    virtual string_type do_curr_symbol() const;
    virtual string_type do_positive_sign() const;
    virtual string_type do_negative_sign() const;
    virtual int         do_frac_digits() const;
    virtual pattern    do_pos_format()   const;
    virtual pattern    do_neg_format()   const;
};

}

```

- ¹ The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the i^{th} component of the format²⁵⁷. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.
- ² Where `none` or `space` appears, whitespace is permitted in the format, except where `none` appears at the end, in which case no whitespace is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.
- ³ The format of the numeric monetary value is a decimal number:

```

value:
  units fractionalopt
  decimal-point digits

fractional:
  decimal-point digitsopt

```

if `frac_digits()` returns a positive value, or

```

value:
  units

```

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

```

units:
  digits
  digits thousands-sep units

digits:
  adigit digitsopt

```

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range '0' through '9' (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. Whitespace characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

²⁵⁷) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

- ⁴ The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `numpunct<>::do_grouping()`.

30.4.7.4.2 Members

[`locale.moneypunct.members`]

```
charT      decimal_point() const;
charT      thousands_sep() const;
string     grouping() const;
string_type curr_symbol() const;
string_type positive_sign() const;
string_type negative_sign() const;
int        frac_digits() const;
pattern    pos_format() const;
pattern    neg_format() const;
```

- ¹ Each of these functions F returns the result of calling the corresponding virtual member function `do_` F `()`.

30.4.7.4.3 Virtual functions

[`locale.moneypunct.virtuals`]

```
charT do_decimal_point() const;
```

- ¹ *Returns:* The radix separator to use in case `do_frac_digits()` is greater than zero.²⁵⁸

```
charT do_thousands_sep() const;
```

- ² *Returns:* The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.²⁵⁹

```
string do_grouping() const;
```

- ³ *Returns:* A pattern defined identically as, but not necessarily equal to, the result of `numpunct<charT>::do_grouping()`.²⁶⁰

```
string_type do_curr_symbol() const;
```

- ⁴ *Returns:* A string to use as the currency identifier symbol.

[*Note 1:* For specializations where the second template parameter is `true`, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space. — *end note*]

```
string_type do_positive_sign() const;
string_type do_negative_sign() const;
```

- ⁵ *Returns:* `do_positive_sign()` returns the string to use to indicate a positive monetary value;²⁶¹ `do_negative_sign()` returns the string to use to indicate a negative value.

```
int do_frac_digits() const;
```

- ⁶ *Returns:* The number of digits after the decimal radix separator, if any.²⁶²

```
pattern do_pos_format() const;
pattern do_neg_format() const;
```

- ⁷ *Returns:* The specializations required in [Table 105 \(30.3.1.2.1\)](#), namely

(7.1) — `moneypunct<char>`,

(7.2) — `moneypunct<wchar_t>`,

(7.3) — `moneypunct<char, true>`, and

(7.4) — `moneypunct<wchar_t, true>`,

return an object of type `pattern` initialized to { `symbol`, `sign`, `none`, `value` }.²⁶³

²⁵⁸) In common U.S. locales this is ‘.’.

²⁵⁹) In common U.S. locales this is ‘,’.

²⁶⁰) To specify grouping by 3s, the value is “\003” *not* “3”.

²⁶¹) This is usually the empty string.

²⁶²) In common U.S. locales, this is 2.

²⁶³) Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, “USD ”.

30.4.7.5 Class template `moneypunct_byname` [locale.moneypunctbyname]

```
namespace std {
    template<class charT, bool Intl = false>
    class moneypunct_byname : public moneypunct<charT, Intl> {
        public:
            using pattern      = money_base::pattern;
            using string_type = basic_string<charT>

            explicit moneypunct_byname(const char*, size_t refs = 0);
            explicit moneypunct_byname(const string&, size_t refs = 0);

        protected:
            ~moneypunct_byname();
    };
}
```

30.4.8 The message retrieval category

[category.messages]

30.4.8.1 General

[category.messages.general]

- 1 Class `messages<charT>` implements retrieval of strings from message catalogs.

30.4.8.2 Class template `messages` [locale.messages]

30.4.8.2.1 General

[locale.messages.general]

```
namespace std {
    class messages_base {
        public:
            using catalog = unspecified signed integer type;
    };

    template<class charT>
    class messages : public locale::facet, public messages_base {
        public:
            using char_type   = charT;
            using string_type = basic_string<charT>

            explicit messages(size_t refs = 0);

            catalog open(const string& fn, const locale&) const;
            string_type get(catalog c, int set, int msgid,
                            const string_type& dfault) const;
            void close(catalog c) const;

            static locale::id id;

        protected:
            ~messages();
            virtual catalog do_open(const string&, const locale&) const;
            virtual string_type do_get(catalog, int set, int msgid,
                                       const string_type& dfault) const;
            virtual void do_close(catalog) const;
    };
}
```

- 1 Values of type `messages_base::catalog` usable as arguments to members `get` and `close` can be obtained only by calling member `open`.

30.4.8.2.2 Members

[locale.messages.members]

`catalog open(const string& name, const locale& loc) const;`

- 1 *Returns:* `do_open(name, loc)`.

`string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;`

- 2 *Returns:* `do_get(cat, set, msgid, dfault)`.

```
void close(catalog cat) const;
3   Effects: Calls do_close(cat).
```

30.4.8.2.3 Virtual functions

[locale.messages.virtuals]

```
catalog do_open(const string& name, const locale& loc) const;
```

1 Returns: A value that may be passed to get() to retrieve a message from the message catalog identified by the string `name` according to an implementation-defined mapping. The result can be used until it is passed to `close()`.

2 Returns a value less than 0 if no such catalog can be opened.

3 Remarks: The locale argument `loc` is used for character set code conversion when retrieving messages, if needed.

```
string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
```

4 Preconditions: `cat` is a catalog obtained from `open()` and not yet closed.

5 Returns: A message identified by arguments `set`, `msgid`, and `dfault`, according to an implementation-defined mapping. If no such message can be found, returns `dfault`.

```
void do_close(catalog cat) const;
```

6 Preconditions: `cat` is a catalog obtained from `open()` and not yet closed.

7 Effects: Releases unspecified resources associated with `cat`.

8 Remarks: The limit on such resources, if any, is implementation-defined.

30.4.8.3 Class template messages_byname

[locale.messagesbyname]

```
namespace std {
    template<class charT>
    class messages_byname : public messages<charT> {
        public:
            using catalog      = messages_base::catalog;
            using string_type = basic_string<charT>;
            explicit messages_byname(const char*, size_t refs = 0);
            explicit messages_byname(const string&, size_t refs = 0);

        protected:
            ~messages_byname();
    };
}
```

30.5 C library locales

[c.locales]

30.5.1 Header <clocale> synopsis

[clocale.syn]

```
namespace std {
    struct lconv;

    char* setlocale(int category, const char* locale);
    lconv* localeconv();
}

#define NULL see 17.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below
```

¹ The contents and meaning of the header <clocale> are the same as the C standard library header <locale.h>.

30.5.2 Data races

[clocale.data.races]

- ¹ Calls to the function `setlocale` may introduce a data race (16.4.6.10) with other calls to `setlocale` or with calls to the functions listed in Table 116.

SEE ALSO: ISO/IEC 9899:2018, 7.11

Table 116 — Potential `setlocale` data races [tab:setlocale.data.races]

30.6 Text encodings identification

[text.encoding]

30.6.1 Header <text_encoding> synopsis

[text.encoding.syn]

```
namespace std {
    struct text_encoding;

    // 30.6.2.7, hash support
    template<class T> struct hash;
    template<> struct hash<text_encoding>;
}
```

30.6.2 Class text_encoding

[text.encoding.class]

30.6.2.1 Overview

[text.encoding.overview]

- ¹ The class `text_encoding` describes an interface for accessing the IANA Character Sets registry.

```
namespace std {
    struct text_encoding {
        static constexpr size_t max_name_length = 63;

        // 30.6.2.6, enumeration text_encoding::id
        enum class id : int_least32_t {
            see below
        };
        using enum id;

        constexpr text_encoding() = default;
        constexpr explicit text_encoding(string_view enc) noexcept;
        constexpr text_encoding(id i) noexcept;

        constexpr id mib() const noexcept;
        constexpr const char* name() const noexcept;

        struct aliases_view;
        constexpr aliases_view aliases() const noexcept;

        friend constexpr bool operator==(const text_encoding& encoding,
                                         const text_encoding& other) noexcept;
        friend constexpr bool operator==(const text_encoding& encoding, id i) noexcept;

        static consteval text_encoding literal() noexcept;
        static text_encoding environment();
        template<id i> static bool environment_is();
    };
}
```

```

private:
    id mib_ = id::unknown;                                // exposition only
    char name_[max_name_length + 1] = {0};                // exposition only
    static constexpr bool comp-name(string_view a, string_view b); // exposition only
};

}

```

- 2 Class `text_encoding` is a trivially copyable type (6.8.1).

30.6.2.2 General

[`text.encoding.general`]

- 1 A *registered character encoding* is a character encoding scheme in the IANA Character Sets registry.

[*Note 1*: The IANA Character Sets registry uses the term “character sets” to refer to character encodings. — *end note*]

The primary name of a registered character encoding is the name of that encoding specified in the IANA Character Sets registry.

- 2 The set of known registered character encodings contains every registered character encoding specified in the IANA Character Sets registry except for the following:

(2.1) — NATS-DANO (33)

(2.2) — NATS-DANO-ADD (34)

- 3 Each known registered character encoding is identified by an enumerator in `text_encoding::id`, and has a set of zero or more *aliases*.

- 4 The set of aliases of a known registered character encoding is an implementation-defined superset of the aliases specified in the IANA Character Sets registry. No two aliases or primary names of distinct registered character encodings are equivalent when compared by `text_encoding::comp-name`.

- 5 How a `text_encoding` object is determined to be representative of a character encoding scheme implemented in the translation or execution environment is implementation-defined.

- 6 An object `e` of type `text_encoding` such that `e.mib() == text_encoding::id::unknown` is `false` and `e.mib() == text_encoding::id::other` is `false` maintains the following invariants:

(6.1) — `e.name() == nullptr` is `false`, and

(6.2) — `e.mib() == text_encoding(e.name()).mib()` is `true`.

- 7 *Recommended practice*:

(7.1) — Implementations should not consider registered encodings to be interchangeable.

[*Example 1*: Shift_JIS and Windows-31J denote different encodings. — *end example*]

(7.2) — Implementations should not use the name of a registered encoding to describe another similar yet different non-registered encoding unless there is a precedent on that implementation.

[*Example 2*: Big5 — *end example*]

30.6.2.3 Members

[`text.encoding.members`]

```
constexpr explicit text_encoding(string_view enc) noexcept;
```

- 1 *Preconditions*:

(1.1) — `enc` represents a string in the ordinary literal encoding consisting only of elements of the basic character set (5.3).

(1.2) — `enc.size() <= max_name_length` is `true`.

(1.3) — `enc.contains('\0')` is `false`.

- 2 *Postconditions*:

(2.1) — If there exists a primary name or alias `a` of a known registered character encoding such that `comp-name(a, enc)` is `true`, `mib_` has the value of the enumerator of `id` associated with that registered character encoding. Otherwise, `mib_ == id::other` is `true`.

(2.2) — `enc.compare(name_) == 0` is `true`.

```

constexpr text_encoding(id i) noexcept;
3   Preconditions: i has the value of one of the enumerators of id.
4   Postconditions:
(4.1)   — mib_ == i is true.
(4.2)   — If (mib_ == id::unknown || mib_ == id::other) is true, strlen(name_) == 0 is true. Otherwise, ranges::contains(alises(), string_view(name_)) is true.

constexpr id mib() const noexcept;
5   Returns: mib_.

constexpr const char* name() const noexcept;
6   Returns: name_ if (name_[0] != '\0') is true, and nullptr otherwise.
7   Remarks: If name() == nullptr is false, name() is an NTBS and accessing elements of name_ outside of the range name() + [0, strlen(name()) + 1) is undefined behavior.

constexpr aliases_view alises() const noexcept;
Let r denote an instance of aliases_view. If *this represents a known registered character encoding, then:
(7.1)   — r.front() is the primary name of the registered character encoding,
(7.2)   — r contains the aliases of the registered character encoding, and
(7.3)   — r does not contain duplicate values when compared with strcmp.

Otherwise, r is an empty range.
8   Each element in r is a non-null, non-empty NTBS encoded in the literal character encoding and comprising only characters from the basic character set.

9   Returns: r.

10  [Note 1: The order of aliases in r is unspecified. — end note]

static consteval text_encoding literal() noexcept;
11  Mandates: CHAR_BIT == 8 is true.
12  Returns: A text_encoding object representing the ordinary character literal encoding (5.3).

static text_encoding environment();
13  Mandates: CHAR_BIT == 8 is true.
14  Returns: A text_encoding object representing the implementation-defined character encoding scheme of the environment. On a POSIX implementation, this is the encoding scheme associated with the POSIX locale denoted by the empty string "".
15  [Note 2: This function is not affected by calls to setlocale. — end note]
16  Recommended practice: Implementations should return a value that is not affected by calls to the POSIX function setenv and other functions which can modify the environment (17.13).

template<id i>
static bool environment_is();
17  Mandates: CHAR_BIT == 8 is true.
18  Returns: environment() == i.

static constexpr bool comp-name(string_view a, string_view b);
19  Returns: true if the two strings a and b encoded in the ordinary literal encoding are equal, ignoring, from left-to-right,
(19.1)   — all elements that are not digits or letters (16.3.3.3.4.1),
(19.2)   — character case, and

```

(19.3) — any sequence of one or more 0 characters not immediately preceded by a numeric prefix, where a numeric prefix is a sequence consisting of a digit in the range [1, 9] optionally followed by one or more elements which are not digits or letters,

and `false` otherwise.

[*Note 3*: This comparison is identical to the “Charset Alias Matching” algorithm described in the Unicode Technical Standard 22. — *end note*]

[*Example 1*:

```
static_assert(comp-name("UTF-8", "utf8") == true);
static_assert(comp-name("u.t.f-008", "utf8") == true);
static_assert(comp-name("ut8", "utf8") == false);
static_assert(comp-name("utf-80", "utf8") == false);
— end example]
```

30.6.2.4 Comparison functions

[text.encoding.cmp]

```
friend constexpr bool operator==(const text_encoding& a, const text_encoding& b) noexcept;
```

1 *Returns*: If `a.mib_ == id::other && b.mib_ == id::other` is `true`, then `comp-name(a.name_, b.name_)`. Otherwise, `a.mib_ == b.mib_`.

```
friend constexpr bool operator==(const text_encoding& encoding, id i) noexcept;
```

2 *Returns*: `encoding.mib_ == i`.

3 *Remarks*: This operator induces an equivalence relation on its arguments if and only if `i != id::other` is `true`.

30.6.2.5 Class `text_encoding::aliases_view`

[text.encoding.aliases]

```
struct text_encoding::aliases_view : ranges::view_interface<text_encoding::aliases_view> {
    constexpr implementation-defined begin() const;
    constexpr implementation-defined end() const;
};

1   text_encoding::aliases_view models copyable, ranges::view, ranges::random_access_range,
    and ranges::borrowed_range.

2   Both ranges::range_value_t<text_encoding::aliases_view> and ranges::range_reference_t<text_encoding::aliases_view> denote const char*.
```

30.6.2.6 Enumeration `text_encoding::id`

[text.encoding.id]

```
namespace std {
    enum class text_encoding::id : int_least32_t {
        other = 1,
        unknown = 2,
        ASCII = 3,
        ISOLatin1 = 4,
        ISOLatin2 = 5,
        ISOLatin3 = 6,
        ISOLatin4 = 7,

};

}

```

[*Note 1*: The `text_encoding::id` enumeration contains an enumerator for each known registered character encoding. For each encoding, the corresponding enumerator is derived from the alias beginning with “`cs`”, as follows

- `csUnicode` is mapped to `text_encoding::id::UCS2`,
 - `csIBBM904` is mapped to `text_encoding::id::IBM904`, and
 - the “`cs`” prefix is removed from other names.
- *end note*]

30.6.2.7 Hash support

[`text.encoding.hash`]

```
template<> struct hash<text_encoding>;
```

¹ The specialization is enabled ([22.10.19](#)).

31 Input/output library [input.output]

31.1 General

[input.output.general]

- ¹ This Clause describes components that C++ programs may use to perform input/output operations.
- ² The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in [Table 117](#).

Table 117 — Input/output library summary [tab:iostreams.summary]

Subclause	Header
31.2 Requirements	
31.3 Forward declarations	<code><iostreamfwd></code>
31.4 Standard iostream objects	<code><iostream></code>
31.5 Iostreams base classes	<code><iost></code>
31.6 Stream buffers	<code><streambuf></code>
31.7 Formatting and manipulators	<code><iostream>, <ostream>, <iomanip>, <print></code>
31.8 String streams	<code><sstream></code>
31.9 Span-based streams	<code><spanstream></code>
31.10 File streams	<code><fstream></code>
31.11 Synchronized output streams	<code><syncstream></code>
31.12 File systems	<code><filesystem></code>
31.13 C library files	<code><cstdio>, <cinttypes></code>

31.2 Iostreams requirements

[iostreams.requirements]

31.2.1 Imbue limitations

[iostream.limits.imbue]

- ¹ No function described in [Clause 31](#) except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in [Clause 31](#) or as an overriding virtual function of any class declared in [Clause 31](#) calls `imbue`, the behavior is undefined.

31.2.2 Types

[stream.types]

```
using streamoff = implementation-defined;
```

- ¹ The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.²⁶⁴

```
using streamsize = implementation-defined;
```

- ² The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.²⁶⁵

31.2.3 Positioning type limitations

[iostreams.limits.pos]

- ¹ The classes of [Clause 31](#) with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.
- ² [Note 1: For each of the specializations of `char_traits` defined in [23.2.4](#), `state_type` denotes `mbstate_t`, `pos_type` denotes `fpos<mbstate_t>`, and `off_type` denotes `streamoff`. —end note]
- ³ In the classes of [Clause 31](#), a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated.

²⁶⁴⁾ Typically `long long`.

²⁶⁵⁾ Most places where `streamsize` is used would use `size_t` in ISO C, or `ssize_t` in POSIX.

31.2.4 Thread safety

[**iostreams.threadsafety**]

- ¹ Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.9.2) unless otherwise specified (31.4).

[*Note 1*: Data races result in undefined behavior (6.9.2). — *end note*]

- ² If one thread makes a library call *a* that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call *b* such that this does not result in a data race, then *a*'s write synchronizes with *b*'s read.

31.3 Forward declarations

[**iostream.forward**]

31.3.1 Header <iosfwd> synopsis

[**iosfwd.syn**]

```
namespace std {
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;

```

```

    using u8streampos = fpos<char_traits<char8_t>::state_type>;
    using u16streampos = fpos<char_traits<char16_t>::state_type>;
    using u32streampos = fpos<char_traits<char32_t>::state_type>;
}

```

- ¹ Default template arguments are described as appearing both in `<iostream>` and in the synopsis of other headers but it is well-formed to include both `<iostream>` and one or more of the other headers.²⁶⁶

31.3.2 Overview

[`iostream.forward.overview`]

- ¹ The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.
 - ² The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`.
 - ³ The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_isstream` and `basic_ifstream`.
 - ⁴ The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, and `basic_osyncstream`.
 - ⁵ The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.
 - ⁶ [Note 1: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (23.2). — end note]
 - ⁷ Other *typedef-names* define instances of class templates specialized for `char` or `wchar_t` types.
 - ⁸ Specializations of the class template `fpos` are used for specifying file position information.
- [Example 1: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. — end example]
- ⁹ [Note 2: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. — end note]

31.4 Standard iostream objects

[`iostream.objects`]

31.4.1 Header `<iostream>` synopsis

[`iostream.syn`]

```

#include <iostream>           // see 31.5.1
#include <streambuf>          // see 31.6.1
#include <iostream>            // see 31.7.1
#include <ostream>             // see 31.7.2

namespace std {
    extern istream cin;
    extern ostream cout;
    extern ostream cerr;
    extern ostream clog;

    extern wistream wcin;
    extern wostream wcout;
    extern wostream wcerr;
    extern wostream wclog;
}

```

31.4.2 Overview

[`iostream.objects.overview`]

- ¹ In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (31.13.1).
- ² The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects.

²⁶⁶) It is the implementation's responsibility to implement headers so that including `<iostream>` and other headers does not violate the rules about multiple occurrences of default arguments.

³ The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.9.3.1) begins execution. The objects are not destroyed during program execution.²⁶⁷

⁴ *Recommended practice:* If it is possible for them to do so, implementations should initialize the objects earlier than required.

⁵ The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration. Each C++ library module (16.4.2.4) in a hosted implementation shall behave as if it contains an interface unit that defines an unexported `ios_base::Init` variable with ordered initialization (6.9.3.3).

[*Note 1:* As a result, the definition of that variable is appearance-ordered before any declaration following the point of importation of a C++ library module. Whether such a definition exists is unobservable by a program that does not reference any of the standard iostream objects. — *end note*]

⁶ Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on FILEs, as specified in the C standard library.

⁷ Concurrent access to a synchronized (31.5.2.5) standard iostream object's formatted and unformatted input (31.7.5.2) and output (31.7.6.2) functions or a standard C stream by multiple threads does not result in a data race (6.9.2).

[*Note 2:* Unsynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters. — *end note*]

SEE ALSO: ISO/IEC 9899:2018, 7.21.2

31.4.3 Narrow stream objects

[narrow.stream.objects]

`istream cin;`

¹ The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

² After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream cout;`

³ The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`ostream cerr;`

⁴ The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

⁵ After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream clog;`

⁶ The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

31.4.4 Wide stream objects

[wide.stream.objects]

`wistream wcin;`

¹ The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

² After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wcout;`

³ The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

²⁶⁷⁾ Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

```
wostream wcerr;
4   The object wcerr controls output to a stream buffer associated with the object stderr, declared in
<cstdio> (31.13.1).
5   After the object wcerr is initialized, wcerr.flags() & unitbuf is nonzero and wcerr.tie() returns
&wcout. Its state is otherwise the same as required for basic_ios<wchar_t>::init (31.5.4.2).

wostream wclog;
6   The object wclog controls output to a stream buffer associated with the object stderr, declared in
<cstdio> (31.13.1).
```

31.5 Iostreams base classes

[**iostreams.base**]

31.5.1 Header <iostream> synopsis

[**ios.syn**]

```
#include <iostream> // see 31.3.1

namespace std {
    using streamoff = implementation-defined;
    using streamsize = implementation-defined;
    template<class stateT> class fpos;

    class ios_base;
    template<class charT, class traits = char_traits<charT>>
        class basic_ios;

    // 31.5.5, manipulators
    ios_base& boolalpha (ios_base& str);
    ios_base& noboolalpha(ios_base& str);

    ios_base& showbase (ios_base& str);
    ios_base& noshowbase (ios_base& str);

    ios_base& showpoint (ios_base& str);
    ios_base& noshowpoint(ios_base& str);

    ios_base& showpos (ios_base& str);
    ios_base& noshowpos (ios_base& str);

    ios_base& skipws (ios_base& str);
    ios_base& noskipws (ios_base& str);

            using seekdir = T4;
            static constexpr seekdir beg = unspecified;
            static constexpr seekdir cur = unspecified;
            static constexpr seekdir end = unspecified;

            class Init;
```

```

// 31.5.2.3, fmtflags state
fmtflags flags() const;
fmtflags flags(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl, fmtflags mask);
void unsetf(fmtflags mask);

streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

// 31.5.2.4, locales
locale imbue(const locale& loc);
locale getloc() const;

// 31.5.2.6, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

// destructor
virtual ~ios_base();

// 31.5.2.7, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;

static bool sync_with_stdio(bool sync = true);

protected:
    ios_base();

private:
    static int index;           // exposition only
    long* iarray;              // exposition only
    void** parray;             // exposition only
};

}

```

¹ `ios_base` defines several member types:

- (1.1) — a type `failure`, defined as either a class derived from `system_error` or a synonym for a class derived from `system_error`;
- (1.2) — a class `Init`;
- (1.3) — three bitmask types, `fmtflags`, `iostate`, and `openmode`;
- (1.4) — an enumerated type, `seekdir`.

² It maintains several kinds of data:

- (2.1) — state information that reflects the integrity of the stream buffer;
- (2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;
- (2.3) — additional information that is stored by the program for its private use.

³ [Note 1: For the sake of exposition, the maintained data is presented here as:

- (3.1) — `static int index`, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

- (3.2) — `long* iarray`, points to the first element of an arbitrary-length `long` array maintained for the private use of the program;
 - (3.3) — `void** parray`, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.
- *end note*

31.5.2.2 Types

[ios.types]

31.5.2.2.1 Class `ios_base::failure`

```
namespace std {
    class ios_base::failure : public system_error {
    public:
        explicit failure(const string& msg, const error_code& ec = io_errc::stream);
        explicit failure(const char* msg, const error_code& ec = io_errc::stream);
    };
}
```

- 1 An implementation is permitted to define `ios_base::failure` as a synonym for a class with equivalent functionality to class `ios_base::failure` shown in this subclause.

[*Note 1*: When `ios_base::failure` is a synonym for another type, that type is required to provide a nested type `failure` to emulate the injected-class-name. — *end note*]

The class `failure` defines the base class for the types of all objects thrown as exceptions, by functions in the `iostreams` library, to report errors detected during stream buffer operations.

- 2 When throwing `ios_base::failure` exceptions, implementations should provide values of `ec` that identify the specific reason for the failure.

[*Note 2*: Errors arising from the operating system would typically be reported as `system_category()` errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as `error_code(io_errc::stream, iostream_category())`. — *end note*]

```
explicit failure(const string& msg, const error_code& ec = io_errc::stream);
```

- 3 *Effects*: Constructs the base class with `msg` and `ec`.

```
explicit failure(const char* msg, const error_code& ec = io_errc::stream);
```

- 4 *Effects*: Constructs the base class with `msg` and `ec`.

31.5.2.2.2 Type `ios_base::fmtflags`

[ios.fmtflags]

```
using fmtflags = T1;
```

- 1 The type `fmtflags` is a bitmask type (16.3.3.3). Setting its elements has the effects indicated in Table 118.
- 2 Type `fmtflags` also defines the constants indicated in Table 119.

31.5.2.2.3 Type `ios_base::iostate`

[ios.iostate]

```
using iostate = T2;
```

- 1 The type `iostate` is a bitmask type (16.3.3.3) that contains the elements indicated in Table 120.
- 2 Type `iostate` also defines the constant:

- (2.1) — `goodbit`, the value zero.

31.5.2.2.4 Type `ios_base::openmode`

[ios.openmode]

```
using openmode = T3;
```

- 1 The type `openmode` is a bitmask type (16.3.3.3). It contains the elements indicated in Table 121.

31.5.2.2.5 Type `ios_base::seekdir`

[ios.seekdir]

```
using seekdir = T4;
```

- 1 The type `seekdir` is an enumerated type (16.3.3.3.2) that contains the elements indicated in Table 122.

Table 118 — `fmtflags` effects [tab:ios(fmtflags)]

Element	Effect(s) if set
<code>boolalpha</code>	insert and extract <code>bool</code> type in alphabetic format
<code>dec</code>	converts integer input or generates integer output in decimal base
<code>fixed</code>	generate floating-point output in fixed-point notation
<code>hex</code>	converts integer input or generates integer output in hexadecimal base
<code>internal</code>	adds fill characters at a designated internal point in certain generated output, or identical to <code>right</code> if no such point is designated
<code>left</code>	adds fill characters on the right (final positions) of certain generated output
<code>oct</code>	converts integer input or generates integer output in octal base
<code>right</code>	adds fill characters on the left (initial positions) of certain generated output
<code>scientific</code>	generates floating-point output in scientific notation
<code>showbase</code>	generates a prefix indicating the numeric base of generated integer output
<code>showpoint</code>	generates a decimal-point character unconditionally in generated floating-point output
<code>showpos</code>	generates a + sign in non-negative generated numeric output
<code>skipws</code>	skips leading whitespace before certain input operations
<code>unitbuf</code>	flushes output after each output operation
<code>uppercase</code>	replaces certain lowercase letters with their uppercase equivalents in generated output

Table 119 — `fmtflags` constants [tab:ios(fmtflags.const)]

Constant	Allowable values
<code>adjustfield</code>	<code>left</code> <code>right</code> <code>internal</code>
<code>basefield</code>	<code>dec</code> <code>oct</code> <code>hex</code>
<code>floatfield</code>	<code>scientific</code> <code>fixed</code>

Table 120 — `iostate` effects [tab:ios.iostate]

Element	Effect(s) if set
<code>badbit</code>	indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);
<code>eofbit</code>	indicates that an input operation reached the end of an input sequence;
<code>failbit</code>	indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.

Table 121 — `openmode` effects [tab:ios.openmode]

Element	Effect(s) if set
<code>app</code>	seek to end before each write
<code>ate</code>	open and seek to end immediately after opening
<code>binary</code>	perform input and output in binary mode (as opposed to text mode)
<code>in</code>	open for input
<code>noreplace</code>	open in exclusive mode
<code>out</code>	open for output
<code>trunc</code>	truncate an existing stream when opening

Table 122 — seekdir effects [tab:ios.seekdir]

Element	Meaning
<code>beg</code>	request a seek (for subsequent input or output) relative to the beginning of the stream
<code>cur</code>	request a seek relative to the current position within the sequence
<code>end</code>	request a seek relative to the current end of the sequence

31.5.2.2.6 Class `ios_base::Init`[`ios.init`]

```
namespace std {
    class ios_base::Init {
        public:
            Init();
            Init(const Init&) = default;
            ~Init();
            Init& operator=(const Init&) = default;

        private:
            static int init_cnt;           // exposition only
    };
}
```

¹ The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (31.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (31.13.1).

² For the sake of exposition, the maintained data is presented here as:

(2.1) — `static int init_cnt`, counts the number of constructor and destructor calls for class `Init`, initialized to zero.

`Init();`

³ *Effects*: Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

`~Init();`

⁴ *Effects*: If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

31.5.2.3 State functions[`fmtflags.state`]

`fmtflags flags() const;`

¹ *Returns*: The format control information for both input and output.

`fmtflags flags(fmtflags fmtfl);`

² *Postconditions*: `fmtfl == flags()`.

³ *Returns*: The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl);`

⁴ *Effects*: Sets `fmtfl` in `flags()`.

⁵ *Returns*: The previous value of `flags()`.

`fmtflags setf(fmtflags fmtfl, fmtflags mask);`

⁶ *Effects*: Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

⁷ *Returns*: The previous value of `flags()`.

`void unsetf(fmtflags mask);`

⁸ *Effects*: Clears `mask` in `flags()`.

```

    streamsize precision() const;
9      Returns: The precision to generate on certain output conversions.

    streamsize precision(streamsize prec);
10     Postconditions: prec == precision().
11     Returns: The previous value of precision().

    streamsize width() const;
12     Returns: The minimum field width (number of characters) to generate on certain output conversions.

    streamsize width(streamsize wide);
13     Postconditions: wide == width().
14     Returns: The previous value of width().

```

31.5.2.4 Functions

[ios.base.locales]

```
locale imbue(const locale& loc);
```

1 Effects: Calls each registered callback pair (`fn, idx`) (31.5.2.7) as `(*fn)(imbue_event, *this, idx)` at such a time that a call to `ios_base::getloc()` from within `fn` returns the new locale value `loc`.

2 Postconditions: `loc == getloc()`.

3 Returns: The previous value of `getloc()`.

```
locale getloc() const;
```

4 Returns: If no locale has been imbued, a copy of the global C++ locale, `locale()`, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

31.5.2.5 Static members

[ios.members.static]

```
static bool sync_with_stdio(bool sync = true);
```

1 Effects: If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a `false` argument, it allows the standard streams to operate independently of the standard C streams.

2 Returns: `true` if the previous state of the standard iostream objects (31.4) was synchronized and otherwise returns `false`. The first time it is called, the function returns `true`.

3 Remarks: When a standard iostream object `str` is *synchronized* with a standard stdio stream `f`, the effect of inserting a character `c` by

```
    fputc(f, c);
```

is the same as the effect of

```
    str.rdbuf()->sputc(c);
```

for any sequences of characters; the effect of extracting a character `c` by

```
    c = fgetc(f);
```

is the same as the effect of

```
    c = str.rdbuf()->sbumpc();
```

for any sequences of characters; and the effect of pushing back a character `c` by

```
    ungetc(c, f);
```

is the same as the effect of

```
    str.rdbuf()->sputbackc(c);
```

for any sequence of characters.²⁶⁸

268) This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.

31.5.2.6 Storage functions

[ios.base.storage]

```
static int xalloc();
```

1 *Returns:* index ++.

2 *Remarks:* Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

```
long& iword(int idx);
```

3 *Preconditions:* idx is a value obtained by a call to xalloc.

4 *Effects:* If iarray is a null pointer, allocates an array of long of unspecified size and stores a pointer to its first element in iarray. The function then extends the array pointed at by iarray as necessary to include the element iarray[idx]. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operation on the object.²⁶⁹ However, the value of the storage referred to is retained, so that until the next call to copyfmt, calling iword with the same index yields another reference to the same value. If the function fails²⁷⁰ and *this is a base class subobject of a basic_ios<> object or subobject, the effect is equivalent to calling basic_ios<>::setstate(badbit) on the derived object (which may throw failure).

5 *Returns:* On success iarray[idx]. On failure, a valid long& initialized to 0.

```
void*& pword(int idx);
```

6 *Preconditions:* idx is a value obtained by a call to xalloc.

7 *Effects:* If parray is a null pointer, allocates an array of pointers to void of unspecified size and stores a pointer to its first element in parray. The function then extends the array pointed at by parray as necessary to include the element parray[idx]. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operation on the object. However, the value of the storage referred to is retained, so that until the next call to copyfmt, calling pword with the same index yields another reference to the same value. If the function fails²⁷¹ and *this is a base class subobject of a basic_ios<> object or subobject, the effect is equivalent to calling basic_ios<>::setstate(badbit) on the derived object (which may throw failure).

8 *Returns:* On success parray[idx]. On failure a valid void*& initialized to 0.

9 *Remarks:* After a subsequent call to pword(int) for the same object, the earlier return value may no longer be valid.

31.5.2.7 Callbacks

[ios.base.callback]

```
void register_callback(event_callback fn, int idx);
```

1 *Preconditions:* The function fn does not throw exceptions.

2 *Effects:* Registers the pair (fn, idx) such that during calls to imbe() (31.5.2.4), copyfmt(), or ~ios_base() (31.5.2.8), the function fn is called with argument idx. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

3 *Remarks:* Identical pairs are not merged. A function registered twice will be called twice.

31.5.2.8 Constructors and destructor

[ios.base.cons]

```
ios_base();
```

1 *Effects:* Each ios_base member has an indeterminate value after construction. The object's members shall be initialized by calling basic_ios::init before the object's first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~ios_base();
```

2 *Effects:* Calls each registered callback pair (fn, idx) (31.5.2.7) as (*fn)(erase_event, *this, idx) at such time that any ios_base member function called from within fn has well-defined results. Then, any memory obtained is deallocated.

²⁶⁹) An implementation is free to implement both the integer array pointed at by iarray and the pointer array pointed at by parray as sparse data structures, possibly with a one-element cache for each.

²⁷⁰) For example, because it cannot allocate space.

²⁷¹) For example, because it cannot allocate space.

31.5.3 Class template `fpos`

[`fpos`]

```
namespace std {
    template<class stateT> class fpos {
        public:
            // 31.5.3.1, members
            stateT state() const;
            void state(stateT);

        private:
            stateT st;           // exposition only
        };
}
```

31.5.3.1 Members

[`fpos.members`]

```
void state(stateT s);
```

¹ *Effects:* Assigns `s` to `st`.

```
stateT state() const;
```

² *Returns:* Current value of `st`.

31.5.3.2 Requirements

[`fpos.operations`]

- ¹ An `fpos` type specifies file position information. It holds a state object whose type is equal to the template parameter `stateT`. Type `stateT` shall meet the *Cpp17DefaultConstructible* (Table 30), *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17Destructible* (Table 35) requirements. If `is_trivially_copy_constructible_v<stateT>` is true, then `fpos<stateT>` has a trivial copy constructor. If `is_trivially_copy_assignable_v<stateT>` is true, then `fpos<stateT>` has a trivial copy assignment operator. If `is_trivially_destructible_v<stateT>` is true, then `fpos<stateT>` has a trivial destructor. All specializations of `fpos` meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, *Cpp17Destructible*, and *Cpp17EqualityComparable* (Table 28) requirements. In addition, the expressions shown in Table 123 are valid and have the indicated semantics. In that table,

- (1.1) — `P` refers to a specialization of `fpos`,
- (1.2) — `p` and `q` refer to values of type `P` or `const P`,
- (1.3) — `p1` and `q1` refer to modifiable lvalues of type `P`,
- (1.4) — `O` refers to type `streamoff`, and
- (1.5) — `o` and `o2` refer to values of type `streamoff` or `const streamoff`.

Table 123 — Position type requirements [tab:`fpos.operations`]

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
<code>P(o)</code>	<code>P</code>	converts from <code>offset</code>	<i>Effects:</i> Value-initializes the state object.
<code>P p(o);</code> <code>P p = o;</code>			<i>Effects:</i> Value-initializes the state object. <i>Postconditions:</i> <code>p == P(o)</code> is true.
<code>P()</code>	<code>P</code>	<code>P(O)</code>	
<code>P p;</code>		<code>P p(O);</code>	
<code>O(p)</code>	<code>streamoff</code>	converts to <code>offset</code>	<code>P(O(p)) == p</code>
<code>p == q</code>	<code>bool</code>		<i>Remarks:</i> For any two values <code>o</code> and <code>o2</code> , if <code>p</code> is obtained from <code>o</code> converted to <code>P</code> or from a copy of such <code>P</code> value and if <code>q</code> is obtained from <code>o2</code> converted to <code>P</code> or from a copy of such <code>P</code> value, then <code>p == q</code> is true only if <code>o == o2</code> is true.

Table 123 — Position type requirements (continued)

Expression	Return type	Operational semantics	Assertion/note pre-/post-condition
$p \neq q$	bool	$!(p == q)$	
$p + o$	P	+ offset	Remarks: With $q_1 = p + o$; then: $q_1 - o == p$
$p_1 += o$	P&	$+=$ offset	Remarks: With $q_1 = p_1$; before the $+=$, then: $p_1 - o == q_1$
$p - o$	P	- offset	Remarks: With $q_1 = p - o$; then: $q_1 + o == p$
$p_1 -= o$	P&	$=-$ offset	Remarks: With $q_1 = p_1$; before the $=-$, then: $p_1 + o == q_1$
$o + p$	convertible to P	$p + o$	$P(o + p) == p + o$
$p - q$	streamoff	distance	$p == q + (p - q)$

- ² Stream operations that return a value of type `traits::pos_type` return P(0(-1)) as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

31.5.4 Class template `basic_ios`

[ios]

31.5.4.1 Overview

[ios.overview]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ios : public ios_base {
public:
    using char_type    = charT;
    using int_type     = typename traits::int_type;
    using pos_type     = typename traits::pos_type;
    using off_type     = typename traits::off_type;
    using traits_type  = traits;

    // 31.5.4.4, flags functions
    explicit operator bool() const;
    bool operator!() const;
    iostate rdstate() const;
    void clear(iostate state = goodbit);
    void setstate(iostate state);
    bool good() const;
    bool eof() const;
    bool fail() const;
    bool bad() const;

    iostate exceptions() const;
    void exceptions(iostate except);

    // 31.5.4.2, constructor/destructor
    explicit basic_ios(basic_streambuf<charT, traits>* sb);
    virtual ~basic_ios();

    // 31.5.4.3, members
    basic_ostream<charT, traits>* tie() const;
    basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);

    basic_streambuf<charT, traits>* rdbuf() const;
    basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

    basic_ios& copyfmt(const basic_ios& rhs);

    char_type fill() const;
    char_type fill(char_type ch);
}

```

```

locale imbue(const locale& loc);

char      narrow(char_type c, char dfault) const;
char_type widen(char c) const;

basic_ios(const basic_ios&) = delete;
basic_ios& operator=(const basic_ios&) = delete;

protected:
    basic_ios();
    void init(basic_streambuf<charT, traits>* sb);
    void move(basic_ios& rhs);
    void move(basic_ios&& rhs);
    void swap(basic_ios& rhs) noexcept;
    void set_rdbuf(basic_streambuf<charT, traits>* sb);
};

}

```

31.5.4.2 Constructors

[basic.ios.cons]

```
explicit basic_ios(basic_streambuf<charT, traits>* sb);
```

- 1 *Effects:* Assigns initial values to its member objects by calling `init(sb)`.

```
basic_ios();
```

- 2 *Effects:* Leaves its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~basic_ios();
```

- 3 *Remarks:* The destructor does not destroy `rdbuf()`.

```
void init(basic_streambuf<charT, traits>* sb);
```

- 4 *Postconditions:* The postconditions of this function are indicated in [Table 124](#).

Table 124 — `basic_ios::init()` effects [tab:basic.ios.cons]

Element	Value
<code>rdbuf()</code>	<code>sb</code>
<code>tie()</code>	<code>0</code>
<code>rdstate()</code>	<code>goodbit</code> if <code>sb</code> is not a null pointer, otherwise <code>badbit</code> .
<code>exceptions()</code>	<code>goodbit</code>
<code>flags()</code>	<code>skipws dec</code>
<code>width()</code>	<code>0</code>
<code>precision()</code>	<code>6</code>
<code>fill()</code>	<code>widen(' ')</code>
<code>getloc()</code>	a copy of the value returned by <code>locale()</code>
<code>iarray</code>	a null pointer
<code>parray</code>	a null pointer

31.5.4.3 Member functions

[basic.ios.members]

```
basic_ostream<charT, traits>* tie() const;
```

- 1 *Returns:* An output sequence that is *tied* to (synchronized with) the sequence controlled by the stream buffer.

```
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

- 2 *Preconditions:* If `tiestr` is not null, `tiestr` is not reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

```

3      Postconditions: tiestr == tie().
4      Returns: The previous value of tie().
5
6      basic_streambuf<charT, traits>* rdbuf() const;
7      Returns: A pointer to the streambuf associated with the stream.
8
9      basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
10     Effects: Calls clear().
11     Postconditions: sb == rdbuf().
12     Returns: The previous value of rdbuf().
13
14     locale imbue(const locale& loc);
15     Effects: Calls ios_base::imbue(loc) (31.5.2.4) and if rdbuf() != 0 then rdbuf()>pubimbue(loc) (31.6.3.3.1).
16     Returns: The prior value of ios_base::imbue().
17
18     char narrow(char_type c, char dfault) const;
19     Returns: use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)
20
21     char_type widen(char c) const;
22     Returns: use_facet<ctype<char_type>>(getloc()).widen(c)
23
24     char_type fill() const;
25     Returns: The character used to pad (fill) an output conversion to the specified field width.
26
27     char_type fill(char_type fillch);
28     Postconditions: traits::eq(fillch, fill()).
29     Returns: The previous value of fill().
30
31     basic_ios& copyfmt(const basic_ios& rhs);
32     Effects: If (this == addressof(rhs)) is true does nothing. Otherwise assigns to the member objects of *this the corresponding member objects of rhs as follows:
33
34     — calls each registered callback pair (fn, idx) as (*fn)(erase_event, *this, idx);
35     — then, assigns to the member objects of *this the corresponding member objects of rhs, except that
36
37     — rdstate(), rdbuf(), and exceptions() are left unchanged;
38     — the contents of arrays pointed at by pword and iword are copied, not the pointers themselves;272 and
39     — if any newly stored pointer values in *this point at objects stored outside the object rhs and those objects are destroyed when rhs is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
40     — then, calls each callback pair that was copied from rhs as (*fn)(copyfmt_event, *this, idx);
41     — then, calls exceptions(rhs.exceptions()).
42
43     [Note 1: The second pass through the callback pairs permits a copied pword value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. —end note]
44
45     Postconditions: The postconditions of this function are indicated in Table 125.
46     Returns: *this.
47
48     void move(basic_ios& rhs);

```

²⁷²) This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.

Table 125 — basic_ios::copyfmt() effects [tab:basic.ios.copyfmt]

Element	Value
rdbuf()	<i>unchanged</i>
tie()	<code>rhs.tie()</code>
rdstate()	<i>unchanged</i>
exceptions()	<code>rhs.exceptions()</code>
flags()	<code>rhs.flags()</code>
width()	<code>rhs.width()</code>
precision()	<code>rhs.precision()</code>
fill()	<code>rhs.fill()</code>
getloc()	<code>rhs.getloc()</code>

```

void move(basic_ios&& rhs);
20   Postconditions: *this has the state that rhs had before the function call, except that rdbuf() returns nullptr. rhs is in a valid but unspecified state, except that rhs.rdbuf() returns the same value as it returned before the function call, and rhs.tie() returns nullptr.
void swap(basic_ios& rhs) noexcept;
21   Effects: The states of *this and rhs are exchanged, except that rdbuf() returns the same value as it returned before the function call, and rhs.rdbuf() returns the same value as it returned before the function call.
void set_rdbuf(basic_streambuf<charT, traits>* sb);
22   Preconditions: sb != nullptr is true.
23   Effects: Associates the basic_streambuf object pointed to by sb with this stream without calling clear().
24   Postconditions: rdbuf() == sb is true.
25   Throws: Nothing.

```

31.5.4.4 Flags functions

[iostate.flags]

```

explicit operator bool() const;
1     Returns: !fail().
bool operator!() const;
2     Returns: fail().
iostate rdstate() const;
3     Returns: The error state of the stream buffer.
void clear(iostate state = goodbit);
4     Effects: If ((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0, returns. Otherwise, the function throws an object of class ios_base::failure (31.5.2.2.1), constructed with implementation-defined argument values.
5     Postconditions: If rdbuf() != 0 then state == rdstate(); otherwise rdstate() == (state | ios_base::badbit).
void setstate(iostate state);
6     Effects: Calls clear(rdstate() | state) (which may throw ios_base::failure (31.5.2.2.1)).
bool good() const;
7     Returns: rdstate() == 0

```

```

    bool eof() const;
8     Returns: true if eofbit is set in rdstate().
    bool fail() const;
9     Returns: true if failbit or badbit is set in rdstate().273
    bool bad() const;
10    Returns: true if badbit is set in rdstate().
    iostate exceptions() const;
11    Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.
    void exceptions(iostate except);
12    Effects: Calls clear(rdstate()).
13    Postconditions: except == exceptions().

```

31.5.5 ios_base manipulators

[std.ios.manip]

31.5.5.1 fmtflags manipulators

[fmtflags.manip]

- 1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```
ios_base& boolalpha(ios_base& str);
```

- 2 Effects: Calls str.setf(ios_base::boolalpha).

3 Returns: str.

```
ios_base& noboolalpha(ios_base& str);
```

- 4 Effects: Calls str.unsetf(ios_base::boolalpha).

5 Returns: str.

```
ios_base& showbase(ios_base& str);
```

- 6 Effects: Calls str.setf(ios_base::showbase).

7 Returns: str.

```
ios_base& noshowbase(ios_base& str);
```

- 8 Effects: Calls str.unsetf(ios_base::showbase).

9 Returns: str.

```
ios_base& showpoint(ios_base& str);
```

- 10 Effects: Calls str.setf(ios_base::showpoint).

11 Returns: str.

```
ios_base& noshowpoint(ios_base& str);
```

- 12 Effects: Calls str.unsetf(ios_base::showpoint).

13 Returns: str.

```
ios_base& showpos(ios_base& str);
```

- 14 Effects: Calls str.setf(ios_base::showpos).

15 Returns: str.

```
ios_base& noshowpos(ios_base& str);
```

- 16 Effects: Calls str.unsetf(ios_base::showpos).

17 Returns: str.

²⁷³) Checking badbit also for fail() is historical practice.

```

ios_base& skipws(ios_base& str);
18   Effects: Calls str.setf(ios_base::skipws).
19   Returns: str.

ios_base& noskipws(ios_base& str);
20   Effects: Calls str.unsetf(ios_base::skipws).
21   Returns: str.

ios_base& uppercase(ios_base& str);
22   Effects: Calls str.setf(ios_base::uppercase).
23   Returns: str.

ios_base& nouppercase(ios_base& str);
24   Effects: Calls str.unsetf(ios_base::uppercase).
25   Returns: str.

ios_base& unitbuf(ios_base& str);
26   Effects: Calls str.setf(ios_base::unitbuf).
27   Returns: str.

ios_base& nounitbuf(ios_base& str);
28   Effects: Calls str.unsetf(ios_base::unitbuf).
29   Returns: str.

```

31.5.5.2 adjustfield manipulators

[adjustfield.manip]

- 1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```

ios_base& internal(ios_base& str);
2   Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).
3   Returns: str.

ios_base& left(ios_base& str);
4   Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).
5   Returns: str.

ios_base& right(ios_base& str);
6   Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).
7   Returns: str.

```

31.5.5.3 basefield manipulators

[basefield.manip]

- 1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```

ios_base& dec(ios_base& str);
2   Effects: Calls str.setf(ios_base::dec, ios_base::basefield).
3   Returns: str.274

ios_base& hex(ios_base& str);
4   Effects: Calls str.setf(ios_base::hex, ios_base::basefield).
5   Returns: str.

```

²⁷⁴⁾ The function signature `dec(ios_base&)` can be called by the function signature `basic_ostream& stream::operator<<(ios_base& (*)(ios_base&))` to permit expressions of the form `cout << dec` to change the format flags stored in `cout`.

```
ios_base& oct(ios_base& str);
6   Effects: Calls str.setf(ios_base::oct, ios_base::basefield).
7   Returns: str.
```

31.5.5.4 floatfield manipulators

[floatfield.manip]

- ¹ Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```
ios_base& fixed(ios_base& str);
2   Effects: Calls str.setf(ios_base::fixed, ios_base::floatfield).
3   Returns: str.
```

```
ios_base& scientific(ios_base& str);
4   Effects: Calls str.setf(ios_base::scientific, ios_base::floatfield).
5   Returns: str.
```

```
ios_base& hexfloat(ios_base& str);
6   Effects: Calls str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield).
7   Returns: str.
```

- ⁸ [Note 1: `ios_base::hex` cannot be used to specify a hexadecimal floating-point format, because it is not part of `ios_base::floatfield` (Table 119). — end note]

```
ios_base& defaultfloat(ios_base& str);
9   Effects: Calls str.unsetf(ios_base::floatfield).
10  Returns: str.
```

31.5.6 Error reporting

[error.reporting]

```
error_code make_error_code(io_errc e) noexcept;
1   Returns: error_code(static_cast<int>(e), iostream_category()).
```

```
error_condition make_error_condition(io_errc e) noexcept;
2   Returns: error_condition(static_cast<int>(e), iostream_category()).
```

```
const error_category& iostream_category() noexcept;
3   Returns: A reference to an object of a type derived from class error_category.
```

- ⁴ The object's `default_error_condition` and `equivalent` virtual functions shall behave as specified for the class `error_category`. The object's `name` virtual function shall return a pointer to the string "iostream".

31.6 Stream buffers

[stream.buffers]

31.6.1 Header <streambuf> synopsis

[streambuf.syn]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_streambuf;
    using streambuf = basic_streambuf<char>;
    using wstreambuf = basic_streambuf<wchar_t>;
}
```

- ¹ The header `<streambuf>` defines types that control input from and output to *character* sequences.

31.6.2 Stream buffer requirements

[streambuf.reqts]

- ¹ Stream buffers can impose various constraints on the sequences they control. Some constraints are:
- (1.1) — The controlled input sequence can be not readable.
 - (1.2) — The controlled output sequence can be not writable.
 - (1.3) — The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.

- (1.4) — The controlled sequences can support operations *directly* to or from associated sequences.
- (1.5) — The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.
- 2 Each sequence is characterized by three pointers which, if non-null, all point into the same `charT` array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:
- (2.1) — the *beginning pointer*, or lowest element address in the array (called `xbeg` here);
 - (2.2) — the *next pointer*, or next element address that is a current candidate for reading or writing (called `xnext` here);
 - (2.3) — the *end pointer*, or first element address beyond the end of the array (called `xend` here).
- 3 The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:
- (3.1) — If `xnext` is not a null pointer, then `xbeg` and `xend` shall also be non-null pointers into the same `charT` array, as described above; otherwise, `xbeg` and `xend` shall also be null.
 - (3.2) — If `xnext` is not a null pointer and `xnext < xend` for an output sequence, then a *write position* is available. In this case, `*xnext` shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
 - (3.3) — If `xnext` is not a null pointer and `xbeg < xnext` for an input sequence, then a *putback position* is available. In this case, `xnext[-1]` shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.
 - (3.4) — If `xnext` is not a null pointer and `xnext < xend` for an input sequence, then a *read position* is available. In this case, `*xnext` shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

31.6.3 Class template `basic_streambuf`

[`streambuf`]

31.6.3.1 General

[`streambuf.general`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf {
        public:
            using char_type    = charT;
            using int_type     = typename traits::int_type;
            using pos_type     = typename traits::pos_type;
            using off_type     = typename traits::off_type;
            using traits_type  = traits;

            virtual ~basic_streambuf();

            // 31.6.3.1, locales
            locale pubimbue(const locale& loc);
            locale getloc() const;

            // 31.6.3.2, buffer and positioning
            basic_streambuf* pubsetbuf(char_type* s, streamsize n);
            pos_type pubseekoff(off_type off, ios_base::seekdir way,
                                ios_base::openmode which
                                = ios_base::in | ios_base::out);
            pos_type pubseekpos(pos_type sp,
                                ios_base::openmode which
                                = ios_base::in | ios_base::out);
            int      pubsync();
    };
}
```

```

// get and put areas
// 31.6.3.3.3, get area
streamsize in_avail();
int_type snextc();
int_type sbumpc();
int_type sgetc();
streamsize sgetn(char_type* s, streamsize n);

// 31.6.3.3.4, putback
int_type sputbackc(char_type c);
int_type sungetc();

// 31.6.3.3.5, put area
int_type sputc(char_type c);
streamsize sputn(const char_type* s, streamsize n);

protected:
    basic_streambuf();
    basic_streambuf(const basic_streambuf& rhs);
    basic_streambuf& operator=(const basic_streambuf& rhs);

    void swap(basic_streambuf& rhs);

// 31.6.3.4.2, get area access
char_type* eback() const;
char_type* gptr() const;
char_type* egptr() const;
void gbump(int n);
void setg(char_type* gbeg, char_type* gnext, char_type* gend);

// 31.6.3.4.3, put area access
char_type* pbase() const;
char_type* pptr() const;
char_type* eptr() const;
void pbump(int n);
void setp(char_type* pbeg, char_type* pend);

// 31.6.3.5, virtual functions
// 31.6.3.5.1, locales
virtual void imbue(const locale& loc);

// 31.6.3.5.2, buffer management and positioning
virtual basic_streambuf* setbuf(char_type* s, streamsize n);
virtual pos_type seekoff(off_type off, ios_base::seekdir way,
                        ios_base::openmode which
                        = ios_base::in | ios_base::out);
virtual pos_type seekpos(pos_type sp,
                        ios_base::openmode which
                        = ios_base::in | ios_base::out);
virtual int sync();

// 31.6.3.5.3, get area
virtual streamsize showmany();
virtual streamsize xsgetn(char_type* s, streamsize n);
virtual int_type underflow();
virtual int_type uflow();

// 31.6.3.5.4, putback
virtual int_type pbackfail(int_type c = traits::eof());

// 31.6.3.5.5, put area
virtual streamsize xsputn(const char_type* s, streamsize n);
virtual int_type overflow(int_type c = traits::eof());

```

```
    };
}
```

1 The class template `basic_streambuf` serves as a base class for deriving various *stream buffers* whose objects each control two *character sequences*:

- (1.1) — a character *input sequence*;
- (1.2) — a character *output sequence*.

31.6.3.2 Constructors

[`streambuf.cons`]

```
basic_streambuf();
```

1 *Effects:* Initializes.²⁷⁵

- (1.1) — all pointer member objects to null pointers,
- (1.2) — the `getloc()` member to a copy of the global locale, `locale()`, at the time of construction.

2 *Remarks:* Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

```
basic_streambuf(const basic_streambuf& rhs);
```

3 *Postconditions:*

- (3.1) — `eback() == rhs.eback()`
- (3.2) — `gptr() == rhs.gptr()`
- (3.3) — `egptr() == rhs.egptr()`
- (3.4) — `pbase() == rhs.pbase()`
- (3.5) — `pptr() == rhs.pptr()`
- (3.6) — `eptr() == rhs.eptr()`
- (3.7) — `getloc() == rhs.getloc()`

```
~basic_streambuf();
```

4 *Effects:* None.

31.6.3.3 Public member functions

[`streambuf.members`]

31.6.3.3.1 Locales

[`streambuf.locales`]

```
locale pubimbue(const locale& loc);
```

1 *Effects:* Calls `imbue(loc)`.

2 *Postconditions:* `loc == getloc()`.

3 *Returns:* Previous value of `getloc()`.

```
locale getloc() const;
```

4 *Returns:* If `pubimbue()` has ever been called, then the last value of `loc` supplied, otherwise the current global locale, `locale()`, in effect at the time of construction. If called after `pubimbue()` has been called but before `pubimbue` has returned (i.e., from within the call of `imbue()`) then it returns the previous value.

31.6.3.3.2 Buffer management and positioning

[`streambuf.buffer`]

```
basic_streambuf* pubsetbuf(char_type* s, streamsize n);
```

1 *Returns:* `setbuf(s, n)`.

```
pos_type pubseekoff(off_type off, ios_base::seekdir way,
                    ios_base::openmode which
                    = ios_base::in | ios_base::out);
```

2 *Returns:* `seekoff(off, way, which)`.

²⁷⁵⁾ The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class can be constructed.

```

pos_type pubseekpos(pos_type sp,
    ios_base::openmode which
        = ios_base::in | ios_base::out);

3     Returns: seekpos(sp, which).

int pubsync();
4     Returns: sync().

```

31.6.3.3.3 Get area [streambuf.pub.get]

```

streamsize in_avail();

1     Returns: If a read position is available, returns egptr() - gptr(). Otherwise returns showmany(c)
            (31.6.3.5.3).

int_type snextc();
2     Effects: Calls sumpc().
3     Returns: If that function returns traits::eof(), returns traits::eof(). Otherwise, returns sgetc().

int_type sumpc();
4     Effects: If the input sequence read position is not available, returns uflow(). Otherwise, returns
            traits::to_int_type(*gptr()) and increments the next pointer for the input sequence.

int_type sgetc();
5     Returns: If the input sequence read position is not available, returns underflow(). Otherwise, returns
            traits::to_int_type(*gptr()).

streamsize sgetn(char_type* s, streamsize n);

6     Returns: xsgetn(s, n).

```

31.6.3.3.4 Putback [streambuf.pub.pback]

```

int_type sputbackc(char_type c);

1     Effects: If the input sequence putback position is not available, or if traits::eq(c, gptr()[-1]) is
            false, returns pbackfail(traits::to_int_type(c)). Otherwise, decrements the next pointer for
            the input sequence and returns traits::to_int_type(*gptr()).

int_type sungetc();
2     Effects: If the input sequence putback position is not available, returns pbackfail(). Otherwise,
            decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

```

31.6.3.3.5 Put area [streambuf.pub.put]

```

int_type sputc(char_type c);

1     Effects: If the output sequence write position is not available, returns overflow(traits::to_int_
            type(c)). Otherwise, stores c at the next pointer for the output sequence, increments the pointer, and
            returns traits::to_int_type(c).

streamsize sputn(const char_type* s, streamsize n);

2     Returns: xsputn(s, n).

```

31.6.3.4 Protected member functions [streambuf.protected]

31.6.3.4.1 Assignment [streambuf.assign]

```

basic_streambuf& operator=(const basic_streambuf& rhs);

1     Postconditions:
(1.1)      — eback() == rhs.eback()
(1.2)      — gptr() == rhs.gptr()
(1.3)      — egptr() == rhs.egptr()

```

(1.4) — `pbase()` == `rhs.pbase()`
 (1.5) — `pptr()` == `rhs.pptr()`
 (1.6) — `epptr()` == `rhs.epptr()`
 (1.7) — `getloc()` == `rhs.getloc()`

2 *Returns:* `*this`.

`void swap(basic_streambuf& rhs);`

3 *Effects:* Swaps the data members of `rhs` and `*this`.

31.6.3.4.2 Get area access

[`streambuf.get.area`]

`char_type* eback() const;`

1 *Returns:* The beginning pointer for the input sequence.

`char_type* gptr() const;`

2 *Returns:* The next pointer for the input sequence.

`char_type* egptr() const;`

3 *Returns:* The end pointer for the input sequence.

`void gbump(int n);`

4 *Effects:* Adds `n` to the next pointer for the input sequence.

`void setg(char_type* gbeg, char_type* gnex, char_type* gend);`

5 *Postconditions:* `gbeg` == `eback()`, `gnex` == `gptr()`, and `gend` == `egptr()` are all true.

31.6.3.4.3 Put area access

[`streambuf.put.area`]

`char_type* pbase() const;`

1 *Returns:* The beginning pointer for the output sequence.

`char_type* pptr() const;`

2 *Returns:* The next pointer for the output sequence.

`char_type* epptr() const;`

3 *Returns:* The end pointer for the output sequence.

`void pbump(int n);`

4 *Effects:* Adds `n` to the next pointer for the output sequence.

`void setp(char_type* pbeg, char_type* pend);`

5 *Postconditions:* `pbeg` == `pbase()`, `pbeg` == `pptr()`, and `pend` == `epptr()` are all true.

31.6.3.5 Virtual functions

[`streambuf.virtuals`]

31.6.3.5.1 Locales

[`streambuf.virt.locales`]

`void imbue(const locale&);`

1 *Effects:* Change any translations based on locale.

2 *Remarks:* Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from `streambuf` can safely cache results of calls to locale functions and to members of facets so obtained.

3 *Default behavior:* Does nothing.

31.6.3.5.2 Buffer management and positioning

[`streambuf.virt.buffer`]

`basic_streambuf* setbuf(char_type* s, streamsize n);`

1 *Effects:* Influences stream buffering in a way that is defined separately for each class derived from `basic_streambuf` in this Clause ([31.8.2.5](#), [31.10.3.5](#)).

2 *Default behavior:* Does nothing. Returns `this`.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                  ios_base::openmode which
                  = ios_base::in | ios_base::out);
```

3 *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2.5, 31.10.3.5).

4 *Default behavior:* Returns `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                  ios_base::openmode which
                  = ios_base::in | ios_base::out);
```

5 *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2, 31.10.3).

6 *Default behavior:* Returns `pos_type(off_type(-1))`.

```
int sync();
```

7 *Effects:* Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

8 *Returns:* `-1` on failure. What constitutes failure is determined by each derived class (31.10.3.5).

9 *Default behavior:* Returns zero.

31.6.3.5.3 Get area

[`streambuf.virt.get`]

```
streamsize showmany();276
```

1 *Returns:* An estimate of the number of characters available in the sequence, or `-1`. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmany()` returns `-1`, then calls to `underflow()` or `uflow()` will fail.²⁷⁷

2 *Default behavior:* Returns zero.

3 *Remarks:* Uses `traits::eof()`.

```
streamsize xsgetn(char_type* s, streamsize n);
```

4 *Effects:* Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `sbumpc()`. Assigning stops when either `n` characters have been assigned or a call to `sbumpc()` would return `traits::eof()`.

5 *Returns:* The number of characters assigned.²⁷⁸

6 *Remarks:* Uses `traits::eof()`.

```
int_type underflow();
```

7 The *pending sequence* of characters is defined as the concatenation of

- (7.1) — the empty sequence if `gptr()` is null, otherwise the characters in `[gptr(), egptr())`, followed by
- (7.2) — some (possibly empty) sequence of characters read from the input sequence.

8 The *result character* is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

9 The *backup sequence* is the empty sequence if `eback()` is null, otherwise the characters in `[eback(), gptr())`.

²⁷⁶) The morphemes of `showmany` are “es-how-many-see”, not “show-manic”.

²⁷⁷) `underflow` or `uflow` can fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately”.

²⁷⁸) Classes derived from `basic_streambuf` can provide more efficient ways to implement `xsgetn()` and `xspoutn()` by overriding these definitions from the base class.

10 *Effects:* The function sets up the `gptr()` and `egptr()` such that if the pending sequence is non-empty, then `egptr()` is non-null and the characters in `[gptr(), egptr()]` are the characters in the pending sequence, otherwise either `gptr()` is null or `gptr() == egptr()`.

11 If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either

(11.1) — the backup sequence contains at least `gptr() - eback()` characters, in which case the characters in `[eback(), gptr()]` agree with the last `gptr() - eback()` characters of the backup sequence, or

(11.2) — the characters in `[gptr() - n, gptr()]` agree with the backup sequence (where `n` is the length of the backup sequence).

12 *Returns:* `traits::to_int_type(c)`, where `c` is the first *character* of the *pending sequence*, without moving the input sequence position past it. If the pending sequence is null then the function returns `traits::eof()` to indicate failure.

13 *Default behavior:* Returns `traits::eof()`.

14 *Remarks:* The public members of `basic_streambuf` call this virtual function only if `gptr()` is null or `gptr() >= egptr()`.

```
int_type uflow();
```

15 *Preconditions:* The constraints are the same as for `underflow()`, except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.

16 *Default behavior:* Calls `underflow()`. If `underflow()` returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns the value of `traits::to_int_type(*gptr())` and increments the value of the next pointer for the input sequence.

17 *Returns:* `traits::eof()` to indicate failure.

31.6.3.5.4 Putback

[streambuf.virt.pback]

```
int_type pbackfail(int_type c = traits::eof());
```

1 The *pending sequence* is defined as for `underflow()`, with the modifications that

(1.1) — If `traits::eq_int_type(c, traits::eof())` returns `true`, then the input sequence is backed up one character before the pending sequence is determined.

(1.2) — If `traits::eq_int_type(c, traits::eof())` returns `false`, then `c` is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

2 *Postconditions:* On return, the constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

3 *Returns:* `traits::eof()` to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. `pbackfail()` is called only when put back has really failed.

4 Returns some value other than `traits::eof()` to indicate success.

5 *Default behavior:* Returns `traits::eof()`.

6 *Remarks:* The public functions of `basic_streambuf` call this virtual function only when `gptr()` is null, `gptr() == eback()`, or `traits::eq(traits::to_char_type(c), gptr()[-1])` returns `false`. Other calls shall also satisfy that constraint.

31.6.3.5.5 Put area

[streambuf.virt.put]

```
streamsize xsputn(const char_type* s, streamsize n);
```

1 *Effects:* Writes up to `n` characters to the output sequence as if by repeated calls to `sputc(c)`. The characters written are obtained from successive elements of the array whose first element is designated by `s`. Writing stops when either `n` characters have been written or a call to `sputc(c)` would return `traits::eof()`. It is unspecified whether the function calls `overflow()` when `pptr() == epptp()` becomes `true` or whether it achieves the same effects by other means.

2 *Returns:* The number of characters written.

```
int_type overflow(int_type c = traits::eof());
```

3 *Effects:* Consumes some initial subsequence of the characters of the *pending sequence*. The pending sequence is defined as the concatenation of

(3.1) — the empty sequence if `pbase()` is null, otherwise the `pptr() - pbase()` characters beginning at `pbase()`, followed by

(3.2) — the empty sequence if `traits::eq_int_type(c, traits::eof())` returns `true`, otherwise the sequence consisting of `c`.

4 *Preconditions:* Every overriding definition of this virtual function obeys the following constraints:

(4.1) — The effect of consuming a character on the associated output sequence is specified.²⁷⁹

(4.2) — Let `r` be the number of characters in the pending sequence not consumed. If `r` is nonzero then `pbase()` and `pptr()` are set so that: `pptr() - pbase() == r` and the `r` characters starting at `pbase()` are the associated output stream. In case `r` is zero (all characters of the pending sequence have been consumed) then either `pbase()` is set to `nullptr`, or `pbase()` and `pptr()` are both set to the same non-null value.

(4.3) — The function may fail if either appending some character to the associated output stream fails or if it is unable to establish `pbase()` and `pptr()` according to the above rules.

5 *Returns:* `traits::eof()` or throws an exception if the function fails.

Otherwise, returns some value other than `traits::eof()` to indicate success.²⁸⁰

6 *Default behavior:* Returns `traits::eof()`.

7 *Remarks:* The member functions `sputc()` and `sputn()` call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

31.7 Formatting and manipulators

[[iostream.format](#)]

31.7.1 Header <iostream> synopsis

[[istream.syn](#)]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_istream;

    using istream = basic_istream<char>;
    using wistream = basic_istream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_iostream;

    using iostream = basic_iostream<char>;
    using wiostream = basic_iostream<wchar_t>;

    template<class charT, class traits>
        basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

    template<class Istream, class T>

31.7.5 Input streams

[input.streams]

31.7.5.1 General

[input.streams.general]

- 1 The header <iostream> defines two class templates and a function template that control input from a stream buffer, along with a function template that extracts from stream rvalues.

31.7.5.2 Class template basic_istream

[istream]

31.7.5.2.1 General

[istream.general]

- 1 When a function is specified with a type placeholder of *extended-floating-point-type*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2) in lieu of *extended-floating-point-type*.

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream : virtual public basic_ios<charT, traits> {
        public:
            // types (inherited from basic_ios (31.5.4))
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.7.5.2.2, constructor/destructor
            explicit basic_istream(basic_streambuf<charT, traits*>* sb);
            virtual ~basic_istream();

            // 31.7.5.2.4, prefix/suffix
            class sentry;

            // 31.7.5.3, formatted input
            basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
            basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
            basic_istream& operator>>(ios_base& (*pf)(ios_base&));

            basic_istream& operator>>(bool& n);
            basic_istream& operator>>(short& n);
            basic_istream& operator>>(unsigned short& n);
            basic_istream& operator>>(int& n);
            basic_istream& operator>>(unsigned int& n);
            basic_istream& operator>>(long& n);
            basic_istream& operator>>(unsigned long& n);
            basic_istream& operator>>(long long& n);
            basic_istream& operator>>(unsigned long long& n);
            basic_istream& operator>>(float& f);
            basic_istream& operator>>(double& f);
            basic_istream& operator>>(long double& f);
            basic_istream& operator>>(extended-floating-point-type& f);

            basic_istream& operator>>(void*& p);
            basic_istream& operator>>(basic_streambuf<char_type, traits*>* sb);
}

```

```

// 31.7.5.4, unformatted input
streamsize gcount() const;
int_type get();
basic_istream& get(char_type& c);
basic_istream& get(char_type* s, streamsize n);
basic_istream& get(char_type* s, streamsize n, char_type delim);
basic_istream& get(basic_streambuf<char_type, traits>& sb);
basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);

basic_istream& getline(char_type* s, streamsize n);
basic_istream& getline(char_type* s, streamsize n, char_type delim);

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
int_type peek();
basic_istream& read    (char_type* s, streamsize n);
streamsize  readsome(char_type* s, streamsize n);

basic_istream& putback(char_type c);
basic_istream& unget();
int sync();

pos_type tellg();
basic_istream& seekg(pos_type);
basic_istream& seekg(off_type, ios_base::seekdir);

protected:
// 31.7.5.2.2, copy/move constructor
basic_istream(const basic_istream&) = delete;
basic_istream(basic_istream&& rhs);

// 31.7.5.2.3, assignment and swap
basic_istream& operator=(const basic_istream&) = delete;
basic_istream& operator=(basic_istream&& rhs);
void swap(basic_istream& rhs);
};

// 31.7.5.3.3, character extraction templates
template<class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);

template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char&);

template<class traits>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char&);

template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT(&)[N]);

template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char(&)[N]);

template<class traits, size_t N>
basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char(&)[N]);
}

```

- ² The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.
- ³ Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions*. Both groups of input functions are described as if they obtain (or *extract*) input *characters* by calling `rdbuf()->sbumpc()` or `rdbuf()->sgetc()`. They may use other public members of `istream`.

31.7.5.2.2 Constructors

[`istream.cons`]

```
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

- ¹ *Effects:* Initializes the base class subobject with `basic_ios::init(sb)` (31.5.4.2).

2 *Postconditions:* `gcount() == 0.`

basic_istream(basic_istream&& rhs);

3 *Effects:* Default constructs the base class, copies the `gcount()` from `rhs`, calls `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and sets the `gcount()` for `rhs` to 0.

`virtual ~basic_istream();`

4 *Remarks:* Does not perform any operations of `rdbuf()`.

31.7.5.2.3 Assignment and swap

[istream.assign]

`basic_istream& operator=(basic_istream&& rhs);`

1 *Effects:* Equivalent to `swap(rhs)`.

2 *Returns:* `*this`.

`void swap(basic_istream& rhs);`

3 *Effects:* Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.

31.7.5.2.4 Class `basic_istream::sentry`

[istream.sentry]

```
namespace std {
    template<class charT, class traits>
    class basic_istream<charT, traits>::sentry {
        bool ok_; // exposition only

    public:
        explicit sentry(basic_istream& is, bool noskipws = false);
        ~sentry();
        explicit operator bool() const { return ok_; }
        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

1 The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

`explicit sentry(basic_istream& is, bool noskipws = false);`

2 *Effects:* If `is.good()` is `false`, calls `is.setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()` to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before the `sentry` object is destroyed, the call to `flush` may be eliminated entirely.²⁸¹ If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sbufpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

3 *Remarks:* The constructor

`explicit sentry(basic_istream& is, bool noskipws = false)`

uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

4 To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
    // c is a whitespace character.
```

²⁸¹) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

- 5 If, after any preparation is completed, `is.good()` is `true`, `ok_ != false` otherwise, `ok_ == false`.
 During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).²⁸²

```
~sentry();
```

- 6 *Effects:* None.

```
explicit operator bool() const;
```

- 7 *Returns:* `ok_`.

31.7.5.3 Formatted input functions

[istream.formatted]

31.7.5.3.1 Common requirements

[istream.formatted.reqmts]

- 1 Each formatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false` when converted to a value of type `bool`, the function returns without attempting to obtain any input. If `rdbuf()->sbumpc()` or `rdbuf()->sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

31.7.5.3.2 Arithmetic extractors

[istream.formatted.arithmetic]

```
basic_istream& operator>>(unsigned short& val);
basic_istream& operator>>(unsigned int& val);
basic_istream& operator>>(long& val);
basic_istream& operator>>(unsigned long& val);
basic_istream& operator>>(long long& val);
basic_istream& operator>>(unsigned long long& val);
basic_istream& operator>>(float& val);
basic_istream& operator>>(double& val);
basic_istream& operator>>(long double& val);
basic_istream& operator>>(bool& val);
basic_istream& operator>>(void*& val);
```

- 1 As in the case of the inserters, these extractors depend on the locale's `num_get<>` (30.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 31.7.5.3.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment, where `state` represents the input function's local error state:

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
use_facet<numget>(loc).get(*this, 0, *this, state, val);
```

In the above fragment, `loc` stands for the private member of the `basic_ios` class.

[Note 1: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. —end note]

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```
basic_istream& operator>>(short& val);
```

- 2 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
```

282) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

```

    if (lval < numeric_limits<short>::min()) {
        state |= ios_base::failbit;
        val = numeric_limits<short>::min();
    } else if (numeric_limits<short>::max() < lval) {
        state |= ios_base::failbit;
        val = numeric_limits<short>::max();
    } else
        val = static_cast<short>(lval);

basic_istream& operator>>(int& val);

```

- 3 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```

using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
if (lval < numeric_limits<int>::min()) {
    state |= ios_base::failbit;
    val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
    state |= ios_base::failbit;
    val = numeric_limits<int>::max();
} else
    val = static_cast<int>(lval);

basic_istream& operator>>(extended-floating-point-type& val);

```

- 4 If the floating-point conversion rank of *extended-floating-point-type* is not less than or equal to that of `long double`, then an invocation of the operator function is conditionally supported with implementation-defined semantics.

- 5 Otherwise, let FP be a standard floating-point type:

- (5.1) — if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of `float`, then FP is `float`,
- (5.2) — otherwise, if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of `double`, then FP is `double`,
- (5.3) — otherwise, FP is `long double`.

- 6 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```

using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
FP fval;
use_facet<numget>(loc).get(*this, 0, *this, state, fval);
if (fval < -numeric_limits<extended-floating-point-type>::max()) {
    state |= ios_base::failbit;
    val = -numeric_limits<extended-floating-point-type>::max();
} else if (numeric_limits<extended-floating-point-type>::max() < fval) {
    state |= ios_base::failbit;
    val = numeric_limits<extended-floating-point-type>::max();
} else {
    val = static_cast<extended-floating-point-type>(fval);
}

```

[*Note 2*: When the extended floating-point type has a floating-point conversion rank that is not equal to the rank of any standard floating-point type, then double rounding during the conversion can result in inaccurate results. `from_chars` can be used in situations where maximum accuracy is important. — *end note*]

31.7.5.3.3 basic_istream::operator>>

[**istream.extractors**]

```
basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
```

- 1 *Effects*: None. This extractor does not behave as a formatted input function (as described in [31.7.5.3.1](#)).

- 2 *Returns*: `pf(*this)`.²⁸³

²⁸³) See, for example, the function signature `ws(basic_istream&)` ([31.7.5.5](#)).

```
basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

3 *Effects:* Calls `pf(*this)`. This extractor does not behave as a formatted input function (as described in [31.7.5.3.1](#)).

4 *Returns:* `*this`.

```
basic_istream& operator>>(ios_base& (*pf)(ios_base&));
```

5 *Effects:* Calls `pf(*this)`.²⁸⁴ This extractor does not behave as a formatted input function (as described in [31.7.5.3.1](#)).

6 *Returns:* `*this`.

```
template<class charT, class traits, size_t N>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);
template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);
template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);
```

7 *Effects:* Behaves like a formatted input member (as described in [31.7.5.3.1](#)) of `in`. After a `sentry` object is constructed, `operator>>` extracts characters and stores them into `s`. If `width()` is greater than zero, `n` is `min(size_t(width()), N)`. Otherwise `n` is `N`. `n` is the maximum number of characters stored.

8 Characters are extracted and stored until any of the following occurs:

(8.1) — `n-1` characters are stored;

(8.2) — end of file occurs on the input sequence;

(8.3) — letting `ct` be `use_facet<ctype<charT>>(in.getloc())`, `ct.is(ct.space, c)` is `true`.

9 `operator>>` then stores a null byte (`charT()`) in the next position, which may be the first position if no characters were extracted. `operator>>` then calls `width(0)`.

10 If the function extracted no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

11 *Returns:* `in`.

```
template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);
template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);
template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);
```

12 *Effects:* Behaves like a formatted input member (as described in [31.7.5.3.1](#)) of `in`. A character is extracted from `in`, if one is available, and stored in `c`. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

13 *Returns:* `in`.

```
basic_istream& operator>>(basic_streambuf<charT, traits>* sb);
```

14 *Effects:* Behaves as an unformatted input function ([31.7.5.4](#)). If `sb` is null, calls `setstate(failbit)`, which may throw `ios_base::failure` ([31.5.4.4](#)). After a `sentry` object is constructed, extracts characters from `*this` and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

(14.1) — end-of-file occurs on the input sequence;

(14.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);

(14.3) — an exception occurs (in which case the exception is caught).

15 If the function inserts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

16 *Returns:* `*this`.

²⁸⁴⁾ See, for example, the function signature `dec(ios_base&)` ([31.5.5.3](#)).

31.7.5.4 Unformatted input functions

[istream.unformatted]

- ¹ Each unformatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the default argument `noskipws` (second) argument `true`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false`, when converted to a value of type `bool`, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using `charT()`) in the first location of the array. If `rdbuf() ->sbumpc()` or `rdbuf() ->sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. If no exception has been thrown it stores the number of characters extracted in a member object. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any event the `sentry` object is destroyed before leaving the unformatted input function.

`streamsize gcount() const;`

- ² *Effects:* None. This member function does not behave as an unformatted input function (as described above).
- ³ *Returns:* The number of characters extracted by the last unformatted input member function called for the object. If the number cannot be represented, returns `numeric_limits<streamsize>::max()`.

`int_type get();`

- ⁴ *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character `c`, if one is available. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.
- ⁵ *Returns:* `c` if available, otherwise `traits::eof()`.

`basic_istream& get(char_type& c);`

- ⁶ *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character, if one is available, and assigns it to `c`.²⁸⁵ Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.
- ⁷ *Returns:* `*this`.

`basic_istream& get(char_type* s, streamsize n, char_type delim);`

- ⁸ *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.²⁸⁶ Characters are extracted and stored until any of the following occurs:
- (8.1) — `n` is less than one or `n - 1` characters are stored;
 - (8.2) — end-of-file occurs on the input sequence;
 - (8.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted).
- ⁹ If the function stores no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called. In any case, if `n` is greater than zero it then stores a null character into the next successive location of the array.
- ¹⁰ *Returns:* `*this`.

`basic_istream& get(char_type* s, streamsize n);`

- ¹¹ *Effects:* Calls `get(s, n, widen('\n'))`.
- ¹² *Returns:* Value returned by the call.

²⁸⁵ Note that this function is not overloaded on types `signed char` and `unsigned char`.²⁸⁶ Note that this function is not overloaded on types `signed char` and `unsigned char`.

```
basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);
```

13 *Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, extracts characters and inserts them in the output sequence controlled by **sb**. Characters are extracted and inserted until any of the following occurs:

- (13.1) — end-of-file occurs on the input sequence;
- (13.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (13.3) — **traits::eq(c, delim)** for the next available input character **c** (in which case **c** is not extracted);
- (13.4) — an exception occurs (in which case, the exception is caught but not rethrown).

14 If the function inserts no characters, **ios_base::failbit** is set in the input function's local error state before **setstate** is called.

15 *Returns:* ***this**.

```
basic_istream& get(basic_streambuf<char_type, traits>& sb);
```

16 *Effects:* Calls **get(sb, widen('\n'))**.

17 *Returns:* Value returned by the call.

```
basic_istream& getline(char_type* s, streamsize n, char_type delim);
```

18 *Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, extracts characters and stores them into successive locations of an array whose first element is designated by **s**.²⁸⁷ Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence;
2. **traits::eq(c, delim)** for the next available input character **c** (in which case the input character is extracted but not stored);²⁸⁸
3. **n** is less than one or **n - 1** characters are stored (in which case the function calls **setstate(failbit)**).

19 These conditions are tested in the order shown.²⁸⁹

20 If the function extracts no characters, **ios_base::failbit** is set in the input function's local error state before **setstate** is called.²⁹⁰

21 In any case, if **n** is greater than zero, it then stores a null character (using **charT()**) into the next successive location of the array.

22 *Returns:* ***this**.

23 [Example 1:

```
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;

    char buffer[line_buffer_size];
    int line_number = 0;
    while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line";      // cin.fail() is false
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
            count--;
            // Don't include newline in count
    }
}
```

²⁸⁷ Note that this function is not overloaded on types **signed char** and **unsigned char**.

²⁸⁸ Since the final input character is “extracted”, it is counted in the **gcount()**, even though it is not stored.

²⁸⁹ This allows an input line which exactly fills the buffer, without setting **failbit**. This is different behavior than the historical AT&T implementation.

²⁹⁰ This implies an empty input line will not cause **failbit** to be set.

```

        cout << "Line " << ++line_number;
    }
    cout << "(" << count << " chars): " << buffer << endl;
}
}

— end example]

basic_istream& getline(char_type* s, streamsize n);
24   Returns: getline(s, n, widen('\n'))

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
25   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:
(25.1) — n != numeric_limits<streamsize>::max() (17.3.5) and n characters have been extracted so far
(25.2) — end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit), which may throw ios_base::failure (31.5.4.4));
(25.3) — traits::eq_int_type(traits::to_int_type(c), delim) for the next available input character c (in which case c is extracted).

[Note 1: The last condition will never occur if traits::eq_int_type(delim, traits::eof()). — end note]

26   Returns: *this.

int_type peek();
27   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, reads but does not extract the current input character.

28   Returns: traits::eof() if good() is false. Otherwise, returns rdbuf()->sgetc().

basic_istream& read(char_type* s, streamsize n);
29   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s.291 Characters are extracted and stored until either of the following occurs:
(29.1) — n characters are stored;
(29.2) — end-of-file occurs on the input sequence (in which case the function calls setstate(failbit | eofbit), which may throw ios_base::failure (31.5.4.4)).

30   Returns: *this.

streamsize readsome(char_type* s, streamsize n);
31   Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. If rdbuf()->in_avail() == -1, calls setstate(eofbit) (which may throw ios_base::failure (31.5.4.4)), and extracts no characters;
(31.1) — If rdbuf()->in_avail() == 0, extracts no characters
(31.2) — If rdbuf()->in_avail() > 0, extracts min(rdbuf()->in_avail(), n).

32   Returns: The number of characters extracted.

basic_istream& putback(char_type c);
33   Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sputbackc(c). If

```

²⁹¹ Note that this function is not overloaded on types **signed char** and **unsigned char**.

`rdbuf()` is null, or if `sputbackc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

[Note 2: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

34 >Returns: `*this`.

```
basic_istream& unget();
```

35 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()>sungetc()`. If `rdbuf()` is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

[Note 3: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

36 >Returns: `*this`.

```
int sync();
```

37 *Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `rdbuf()` is a null pointer, returns `-1`. Otherwise, calls `rdbuf()>pubsync()` and, if that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)), and returns `-1`. Otherwise, returns zero.

```
pos_type tellg();
```

38 *Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

39 >Returns: After constructing a `sentry` object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()>pubseekoff(0, cur, in)`.

```
basic_istream& seekg(pos_type pos);
```

40 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf()>pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

41 >Returns: `*this`.

```
basic_istream& seekg(off_type off, ios_base::seekdir dir);
```

42 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf()>pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

43 >Returns: `*this`.

31.7.5.5 Standard `basic_istream` manipulators

[**istream.manip**]

¹ Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);
```

² *Effects:* Behaves as an unformatted input function (31.7.5.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a `sentry` object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the

same criterion as used by `sentry::sentry` (31.7.5.2.4). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

3 *Returns:* `is`.

31.7.5.6 Rvalue stream extraction

[`istream.rvalue`]

```
template<class Istream, class T>
Istream&& operator>>(Istream&& is, T&& x);
```

1 *Constraints:* The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand (7.2.3) and `Istream` is publicly and unambiguously derived from `ios_base`.

2 *Effects:* Equivalent to:

```
is >> std::forward<T>(x);
return std::move(is);
```

31.7.5.7 Class template `basic_iostream`

[`iostreamclass`]

31.7.5.7.1 General

[`iostreamclass.general`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_iostream
        : public basic_istream<charT, traits>,
          public basic_ostream<charT, traits> {
    public:
        using char_type     = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type   = traits;

        // 31.7.5.7.2, constructor
        explicit basic_iostream(basic_streambuf<charT, traits>* sb);

        // 31.7.5.7.3, destructor
        virtual ~basic_iostream();

    protected:
        // 31.7.5.7.2, constructor
        basic_iostream(const basic_iostream&) = delete;
        basic_iostream(basic_iostream&& rhs);

        // 31.7.5.7.4, assignment and swap
        basic_iostream& operator=(const basic_iostream&) = delete;
        basic_iostream& operator=(basic_iostream&& rhs);
        void swap(basic_iostream& rhs);
    };
}
```

1 The class template `basic_iostream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

31.7.5.7.2 Constructors

[`iostream.cons`]

```
explicit basic_iostream(basic_streambuf<charT, traits>* sb);
```

1 *Effects:* Initializes the base class subobjects with `basic_istream<charT, traits>(sb)` (31.7.5.2) and `basic_ostream<charT, traits>(sb)` (31.7.6.2).

2 *Postconditions:* `rdbuf() == sb` and `gcount() == 0`.

```
basic_iostream(basic_iostream&& rhs);
```

3 *Effects:* Move constructs from the rvalue `rhs` by constructing the `basic_istream` base class with `std::move(rhs)`.

31.7.5.7.3 Destructor[**iostream.dest**]

```
virtual ~basic_iostream();
```

1 *Remarks:* Does not perform any operations on `rdbuf()`.

31.7.5.7.4 Assignment and swap[**iostream.assign**]

```
basic_iostream& operator=(basic_iostream&& rhs);
```

1 *Effects:* Equivalent to `swap(rhs)`.

```
void swap(basic_iostream& rhs);
```

2 *Effects:* Calls `basic_istream<charT, traits>::swap(rhs)`.

31.7.6 Output streams[**output.streams**]**31.7.6.1 General**[**output.streams.general**]

- 1 The header `<iostream>` defines a class template and several function templates that control output to a stream buffer, along with a function template that inserts into stream rvalues.

31.7.6.2 Class template basic_ostream[**ostream**]**31.7.6.2.1 General**[**ostream.general**]

- 1 When a function has a parameter type *extended-floating-point-type*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2).

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream : virtual public basic_ios<charT, traits> {
        public:
            // types (inherited from basic_ios (31.5.4))
            using char_type     = charT;
            using int_type      = typename traits::int_type;
            using pos_type      = typename traits::pos_type;
            using off_type      = typename traits::off_type;
            using traits_type   = traits;

            // 31.7.6.2.2, constructor/destructor
            explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
            virtual ~basic_ostream();

            // 31.7.6.2.4, prefix/suffix
            class sentry;

            // 31.7.6.3, formatted output
            basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
            basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
            basic_ostream& operator<<(ios_base& (*pf)(ios_base&));

            basic_ostream& operator<<(bool n);
            basic_ostream& operator<<(short n);
            basic_ostream& operator<<(unsigned short n);
            basic_ostream& operator<<(int n);
            basic_ostream& operator<<(unsigned int n);
            basic_ostream& operator<<(long n);
            basic_ostream& operator<<(unsigned long n);
            basic_ostream& operator<<(long long n);
            basic_ostream& operator<<(unsigned long long n);
            basic_ostream& operator<<(float f);
            basic_ostream& operator<<(double f);
            basic_ostream& operator<<(long double f);
            basic_ostream& operator<<(extended-floating-point-type f);
```

```

basic_ostream& operator<<(const void* p);
basic_ostream& operator<<(const volatile void* p);
basic_ostream& operator<<(nullptr_t);
basic_ostream& operator<<(basic_streambuf<char_type, traits>* sb);

// 31.7.6.4, unformatted output
basic_ostream& put(char_type c);
basic_ostream& write(const char_type* s, streamsize n);

basic_ostream& flush();

// 31.7.6.2.5, seeks
pos_type tellp();
basic_ostream& seekp(pos_type);
basic_ostream& seekp(off_type, ios_base::seekdir);

```

- 2 The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.
- 3 Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or *insert*) output *characters* by actions equivalent to calling `rdbuf()>sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xspoutn()`, and `sync()`.
- 4 If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.
- 5 [Note 1: The deleted overloads of `operator<<` prevent formatting characters as integers and strings as pointers.
— end note]

31.7.6.2.2 Constructors

[[ostream.cons](#)]

```
explicit basic_ostream(basic_streambuf<charT, traits>* sb);
```

- 1 *Effects:* Initializes the base class subobject with `basic_ios<charT, traits>::init(sb)` ([31.5.4.2](#)).
- 2 *Postconditions:* `rdbuf() == sb`.

```
basic_ostream(basic_ostream&& rhs);
```

- 3 *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class and calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class.

```
virtual ~basic_ostream();
```

- 4 *Remarks:* Does not perform any operations on `rdbuf()`.

31.7.6.2.3 Assignment and swap

[[ostream.assign](#)]

```
basic_ostream& operator=(basic_ostream&& rhs);
```

- 1 *Effects:* Equivalent to `swap(rhs)`.
- 2 *Returns:* `*this`.

```
void swap(basic_ostream& rhs);
3   Effects: Calls basic_ios<charT, traits>::swap(rhs).
```

31.7.6.2.4 Class basic_ostream::sentry

[ostream.sentry]

```
namespace std {
    template<class charT, class traits>
    class basic_ostream<charT, traits>::sentry {
        bool ok_;           // exposition only

    public:
        explicit sentry(basic_ostream& os);
        ~sentry();
        explicit operator bool() const { return ok_; }

        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

- ¹ The class **sentry** defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_ostream& os);
```

- ² If `os.good()` is nonzero, prepares for formatted or unformatted output. If `os.tie()` is not a null pointer, calls `os.tie()->flush()`.²⁹²
- ³ If, after any preparation is completed, `os.good()` is true, `ok_ == true` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).²⁹³

```
~sentry();
```

- ⁴ If `(os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good() is true`, calls `os.rdbuf()->pubsync()`. If that function returns -1, sets `badbit` in `os.rdstate()` without propagating an exception.

```
explicit operator bool() const;
```

- ⁵ Effects: Returns `ok_`.

31.7.6.2.5 Seek members

[ostream.seeks]

- ¹ Each seek member function begins execution by constructing an object of class **sentry**. It returns by destroying the **sentry** object.

```
pos_type tellp();
```

- ² Returns: If `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, out)`.

```
basic_ostream& seekp(pos_type pos);
```

- ³ Effects: If `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

- ⁴ Returns: `*this`.

```
basic_ostream& seekp(off_type off, ios_base::seekdir dir);
```

- ⁵ Effects: If `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

- ⁶ Returns: `*this`.

²⁹²) The call `os.tie()->flush()` does not necessarily occur if the function can determine that no synchronization is necessary.

²⁹³) The **sentry** constructor and destructor can also perform additional implementation-dependent operations.

31.7.6.3 Formatted output functions

[`ostream.formatted`]

31.7.6.3.1 Common requirements

[`ostream.formatted.reqmts`]

- 1 Each formatted output function begins execution by constructing an object of class `sentry`. If that object returns `true` when converted to a value of type `bool`, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does `setstate(ios_base::failbit)`, which can throw an exception. If an exception is thrown during output, then `ios_base::badbit` is set²⁹⁴ in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. Whether or not an exception is thrown, the `sentry` object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is `*this`.
- 2 The descriptions of the individual formatted output functions describe how they perform output and do not mention the `sentry` object.
- 3 If a formatted output function of a stream `os` determines padding, it does so as follows. Given a `charT` character sequence `seq` where `charT` is the character type of the stream, if the length of `seq` is less than `os.width()`, then enough copies of `os.fill()` are added to this sequence as necessary to pad to a width of `os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is `true`, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

31.7.6.3.2 Arithmetic inserters

[`ostream.inserters.arithmetic`]

```
basic_ostream& operator<<(bool val);
basic_ostream& operator<<(short val);
basic_ostream& operator<<(unsigned short val);
basic_ostream& operator<<(int val);
basic_ostream& operator<<(unsigned int val);
basic_ostream& operator<<(long val);
basic_ostream& operator<<(unsigned long val);
basic_ostream& operator<<(long long val);
basic_ostream& operator<<(unsigned long long val);
basic_ostream& operator<<(float val);
basic_ostream& operator<<(double val);
basic_ostream& operator<<(long double val);
basic_ostream& operator<<(const void* val);
```

- 1 *Effects:* The classes `num_get`<> and `num_put`<> handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued `locale` value to perform numeric formatting. When `val` is of type `bool`, `long`, `unsigned long`, `long long`, `unsigned long long`, `double`, `long double`, or `const void*`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
        ? static_cast<long>(static_cast<unsigned short>(val))
        : static_cast<long>(val)).failed();
```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
        ? static_cast<long>(static_cast<unsigned int>(val))
        : static_cast<long>(val)).failed();
```

²⁹⁴) This is done without causing an `ios_base::failure` to be thrown.

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<unsigned long>(val)).failed();
```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<double>(val)).failed();
```

- 2 The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<>`. It bypasses `ostreams` and uses `streambufs` directly. Class `locale` relies on these types as its interface to `streams`, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

- 3 *Returns:* `*this`.

```
basic_ostream& operator<<(const volatile void* p);
4 Effects: Equivalent to: return operator<<(const_cast<const void*>(p));
basic_ostream& operator<<(extended-floating-point-type val);
```

- 5 *Effects:* If the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<double>(val)).failed();
```

Otherwise, if the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `long double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
        static_cast<long double>(val)).failed();
```

Otherwise, an invocation of the operator function is conditionally supported with implementation-defined semantics.

If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

- 6 *Returns:* `*this`.

31.7.6.3.3 basic_ostream::operator<<

[`ostream.inserters`]

```
basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
```

- 1 *Effects:* None. Does not behave as a formatted output function (as described in [31.7.6.3.1](#)).

- 2 *Returns:* `pf(*this)`.²⁹⁵

```
basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

- 3 *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in [31.7.6.3.1](#)).

- 4 *Returns:* `*this`.²⁹⁶

²⁹⁵) See, for example, the function signature `endl(basic_ostream&)` ([31.7.6.5](#)).

²⁹⁶) See, for example, the function signature `dec(ios_base&)` ([31.5.5.3](#)).

```
basic_ostream& operator<<(ios_base& (*pf)(ios_base&));
```

5 *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in [31.7.6.3.1](#)).

6 *Returns:* `*this`.

```
basic_ostream& operator<<(basic_streambuf<charT, traits>* sb);
```

7 *Effects:* Behaves as an unformatted output function ([31.7.6.4](#)). After the `sentry` object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

8 Gets characters from `sb` and inserts them in `*this`. Characters are read from `sb` and inserted until any of the following occurs:

(8.1) — end-of-file occurs on the input sequence;

(8.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);

(8.3) — an exception occurs while getting a character from `sb`.

9 If the function inserts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` ([31.5.4.4](#))). If an exception was thrown while extracting a character, the function sets `failbit` in the error state, and if `failbit` is set in `exceptions()` the caught exception is rethrown.

10 *Returns:* `*this`.

```
basic_ostream& operator<<(nullptr_t);
```

11 *Effects:* Equivalent to:

```
    return *this << s;
```

where `s` is an implementation-defined NTCTS ([3.34](#)).

31.7.6.3.4 Character inserter function templates[`ostream.inserters.character`]

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
// specialization
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
// signed and unsigned
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, unsigned char c);
```

1 *Effects:* Behaves as a formatted output function ([31.7.6.3.1](#)) of `out`. Constructs a character sequence `seq`. If `c` has type `char` and the character type of the stream is not `char`, then `seq` consists of `out.widen(c)`; otherwise `seq` consists of `c`. Determines padding for `seq` as described in [31.7.6.3.1](#). Inserts `seq` into `out`. Calls `os.width(0)`.

2 *Returns:* `out`.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out,
                                                const unsigned char* s);
```

3 *Preconditions:* `s` is not a null pointer.

⁴ *Effects:* Behaves like a formatted inserter (as described in 31.7.6.3.1) of `out`. Creates a character sequence `seq` of `n` characters starting at `s`, each widened using `out.widen()` (31.5.4.3), where `n` is the number that would be computed as if by:

- (4.1) — `traits::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const charT*`, and also for the overload where the first argument is of type `basic_ostream<char, traits>&` and the second is of type `const char*`,
- (4.2) — `char_traits<char>::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const char*`,
- (4.3) — `traits::length(reinterpret_cast<const char*>(s))` for the other two overloads.

Determines padding for `seq` as described in 31.7.6.3.1. Inserts `seq` into `out`. Calls `width(0)`.

⁵ *Returns:* `out`.

31.7.6.3.5 Print

[`ostream.formatted.print`]

```
template<class... Args>
void print(ostream& os, format_string<Args...> fmt, Args&&... args);
```

¹ *Effects:* If the ordinary literal encoding (5.3) is UTF-8, equivalent to:

```
vprint_unicode(os, fmt.str, make_format_args(std::forward<Args>(args)...));
```

Otherwise, equivalent to:

```
vprint_nonunicode(os, fmt.str, make_format_args(std::forward<Args>(args)...));
```

```
template<class... Args>
void println(ostream& os, format_string<Args...> fmt, Args&&... args);
```

² *Effects:* Equivalent to:

```
print(os, "{}\n", format(fmt, std::forward<Args>(args)...));
```

```
void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
```

³ *Effects:* Behaves as a formatted output function (31.7.6.3.1) of `os`, except that:

- (3.1) — failure to generate output is reported as specified below, and
- (3.2) — any exception thrown by the call to `vformat` is propagated without regard to the value of `os.exceptions()` and without turning on `ios_base::badbit` in the error state of `os`.

After constructing a `sentry` object, the function initializes an automatic variable via

```
string out = vformat(os.getloc(), fmt, args);
```

If the function is `vprint_unicode` and `os` is a stream that refers to a terminal capable of displaying Unicode which is determined in an implementation-defined manner, writes `out` to the terminal using the native Unicode API; if `out` contains invalid code units, the behavior is undefined and implementations are encouraged to diagnose it. If the native Unicode API is used, the function flushes `os` before writing `out`. Otherwise (if `os` is not such a stream or the function is `vprint_nonunicode`), inserts the character sequence `[out.begin(), out.end()]` into `os`. If writing to the terminal or inserting into `os` fails, calls `os.setstate(ios_base::badbit)` (which may throw `ios_base::failure`).

⁴ *Recommended practice:* For `vprint_unicode`, if invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

31.7.6.4 Unformatted output functions

[`ostream.unformatted`]

- ¹ Each unformatted output function begins execution by constructing an object of class `sentry`. If that object returns `true`, while converting to a value of type `bool`, the function endeavors to generate the requested output. If an exception is thrown during output, then `ios_base::badbit` is set²⁹⁷ in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. In any case, the unformatted output function ends by destroying the `sentry` object, then, if no exception was thrown, returning the value specified for the unformatted output function.

²⁹⁷) This is done without causing an `ios_base::failure` to be thrown.

```
basic_ostream& put(char_type c);
```

2 *Effects:* Behaves as an unformatted output function (as described above). After constructing a **sentry** object, inserts the character **c**, if possible.²⁹⁸

3 Otherwise, calls **setstate(badbit)** (which may throw **ios_base::failure** (31.5.4.4)).

4 *Returns:* ***this**.

```
basic_ostream& write(const char_type* s, streamsize n);
```

5 *Effects:* Behaves as an unformatted output function (as described above). After constructing a **sentry** object, obtains characters to insert from successive locations of an array whose first element is designated by **s**.²⁹⁹ Characters are inserted until either of the following occurs:

(5.1) — **n** characters are inserted;

(5.2) — inserting in the output sequence fails (in which case the function calls **setstate(badbit)**, which may throw **ios_base::failure** (31.5.4.4)).

6 *Returns:* ***this**.

```
basic_ostream& flush();
```

7 *Effects:* Behaves as an unformatted output function (as described above). If **rdbuf()** is not a null pointer, constructs a **sentry** object. If that object returns **true** when converted to a value of type **bool** the function calls **rdbuf()>pubsync()**. If that function returns **-1** calls **setstate(badbit)** (which may throw **ios_base::failure** (31.5.4.4)). Otherwise, if the **sentry** object returns **false**, does nothing.

8 *Returns:* ***this**.

31.7.6.5 Standard manipulators[**ostream.manip**]

- 1 Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>  
    basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
```

- 2 *Effects:* Calls **os.put(os.widen('\n'))**, then **os.flush()**.

- 3 *Returns:* **os**.

```
template<class charT, class traits>  
    basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
```

- 4 *Effects:* Inserts a null character into the output sequence: calls **os.put(charT())**.

- 5 *Returns:* **os**.

```
template<class charT, class traits>  
    basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
```

- 6 *Effects:* Calls **os.flush()**.

- 7 *Returns:* **os**.

```
template<class charT, class traits>  
    basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
```

- 8 *Effects:* If **os.rdbuf()** is a **basic_syncbuf<charT, traits, Allocator>***, called **buf** for the purpose of exposition, calls **buf->set_emit_on_sync(true)**. Otherwise this manipulator has no effect.

[*Note 1:* To work around the issue that the **Allocator** template argument cannot be deduced, implementations can introduce an intermediate base class to **basic_syncbuf** that manages its **emit_on_sync** flag. — *end note*]

- 9 *Returns:* **os**.

298) Note that this function is not overloaded on types **signed char** and **unsigned char**.

299) Note that this function is not overloaded on types **signed char** and **unsigned char**.

```

template<class charT, class traits>
basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);

10   Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called buf for the purpose
    of exposition, calls buf->set_emit_on_sync(false). Otherwise this manipulator has no effect.

11   Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);

12   Effects: Calls os.flush(). Then, if os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*,
    called buf for the purpose of exposition, behaves as an unformatted output function (31.7.6.4)
    of os. After constructing a sentry object, calls buf->emit(). If that call returns false, calls
    os.setstate(ios_base::badbit).

13   Returns: os.

```

31.7.6.6 Rvalue stream insertion

[`ostream.rvalue`]

```

template<class Ostream, class T>
Ostream&& operator<<(Ostream&& os, const T& x);

```

1 *Constraints:* The expression `os << x` is well-formed when treated as an unevaluated operand and
Ostream is publicly and unambiguously derived from `ios_base`.

2 *Effects:* As if by: `os << x;`

3 *Returns:* `std::move(os)`.

31.7.7 Standard manipulators

[`std.manip`]

1 The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

```
unspecified resetiosflags(ios_base::fmtflags mask);
```

2 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:³⁰⁰

```

void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}

```

The expression `out << resetiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```
unspecified setiosflags(ios_base::fmtflags mask);
```

3 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```

void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}

```

The expression `out << setiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

³⁰⁰) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

unspecified `setbase(int base);`

- 4 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```
void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
              base == 10 ? ios_base::dec :
              base == 16 ? ios_base::hex :
              ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression `out << setbase(base)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` has type `basic_istream<charT, traits>&` and value `in`.

unspecified `setfill(char_type c);`

- 5 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
    // set fill character
    str.fill(c);
}
```

The expression `out << setfill(c)` has type `basic_ostream<charT, traits>&` and value `out`.

unspecified `setprecision(int n);`

- 6 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setprecision(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setprecision(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
    // set precision
    str.precision(n);
}
```

The expression `out << setprecision(n)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setprecision(n)` has type `basic_istream<charT, traits>&` and value `in`.

unspecified `setw(int n);`

- 7 *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream<charT, traits>` then the expression `out << setw(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setw(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```
void f(ios_base& str, int n) {
    // set width
    str.width(n);
}
```

The expression `out << setw(n)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setw(n)` has type `basic_istream<charT, traits>&` and value `in`.

31.7.8 Extended manipulators

[[ext.manip](#)]

- 1 The header `<iomanip>` defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

`template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);`

- 2 *Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template ([Clause 23](#)).

3 *Effects:* The expression `in >> get_money(mon, intl)` described below behaves as a formatted input function (31.7.5.3.1).

4 *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_money(mon, intl)` behaves as if it called `f(in, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
    using Iter      = istreambuf_iterator<charT, traits>;
    using MoneyGet = money_get<charT, Iter>;

    ios_base::iostate err = ios_base::goodbit;
    const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());

    mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);

    if (ios_base::goodbit != err)
        str.setstate(err);
}
```

The expression `in >> get_money(mon, intl)` has type `basic_istream<charT, traits>&` and value `in`.

```
template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
```

5 *Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template (Clause 23).

6 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_money(mon, intl)` behaves as a formatted output function (31.7.6.3.1) that calls `f(out, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
    using Iter      = ostreambuf_iterator<charT, traits>;
    using MoneyPut = money_put<charT, Iter>;

    const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
    const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

    if (end.failed())
        str.setstate(ios_base::badbit);
}
```

The expression `out << put_money(mon, intl)` has type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT> unspecified get_time(tm* tmb, const charT* fmt);
```

7 *Preconditions:* The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt)]` is a valid range.

8 *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, tm* tmb, const charT* fmt) {
    using Iter      = istreambuf_iterator<charT, traits>;
    using TimeGet = time_get<charT, Iter>;

    ios_base::iostate err = ios_base::goodbit;
    const TimeGet& tg = use_facet<TimeGet>(str.getloc());

    tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
           fmt, fmt + traits::length(fmt));
```

```

    if (err != ios_base::goodbit)
        str.setstate(err);
}

```

The expression `in >> get_time(tmb, fmt)` has type `basic_istream<charT, traits>&` and value `in`.

```
template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);
```

⁹ *Preconditions:* The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt)]` is a valid range.

¹⁰ *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```

template<class charT, class traits>
void f(basic_ios<charT, traits>& str, const tm* tmb, const charT* fmt) {
    using Iter      = ostreambuf_iterator<charT, traits>;
    using TimePut = time_put<charT, Iter>;

    const TimePut& tp = use_facet<TimePut>(str.getloc());
    const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
                           fmt, fmt + traits::length(fmt));

    if (end.failed())
        str.setstate(ios_base::badbit);
}

```

The expression `out << put_time(tmb, fmt)` has type `basic_ostream<charT, traits>&` and value `out`.

31.7.9 Quoted manipulators

[[quoted.manip](#)]

¹ [Note 1: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — *end note*]

```

template<class charT>
unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT('\\'));
template<class charT, class traits, class Allocator>
unspecified quoted(const basic_string<charT, traits, Allocator>& s,
                  charT delim = charT('"'), charT escape = charT('\\'));
template<class charT, class traits>
unspecified quoted(basic_string_view<charT, traits> s,
                  charT delim = charT('"'), charT escape = charT('\\'));

```

² *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second and third forms is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function ([31.7.6.3.1](#)) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

- (2.1) — `delim`.
- (2.2) — Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.
- (2.3) — `delim`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in [31.7.6.3.1](#), `seq` is inserted as if by calling `out.rdbuf() -> sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

```

template<class charT, class traits, class Allocator>
unspecified quoted(basic_string<charT, traits, Allocator>& s,
                  charT delim = charT('"'), charT escape = charT('\\'));

```

³ *Returns:* An object of unspecified type such that:

- (3.1) — If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `chart` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using `operator>>(basic_istream<charT, traits>&, chart&)` (31.7.5.3.3) which may throw `ios_base::failure` (31.5.2.1):
 - (3.1.1) — If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:
 - (3.1.1.1) — Turn off the `skipws` flag.
 - (3.1.1.2) — `s.clear()`
 - (3.1.1.3) — Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.
 - (3.1.1.4) — Discard the final `delim` character.
 - (3.1.1.5) — Restore the `skipws` flag to its original value.
 - (3.1.2) — Otherwise, `in >> s`.
- (3.2) — If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `chart` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the `const basic_string<charT, traits, Allocator>&` overload of the `quoted` function.
- (3.3) — The expression `in >> quoted(s, delim, escape)` has type `basic_istream<charT, traits>&` and value `in`.
- (3.4) — The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

31.7.10 Print functions

[print.fun]

```
template<class... Args>
void print(format_string<Args...> fmt, Args&&... args);

1   Effects: Equivalent to:
        print(stdout, fmt, std::forward<Args>(args)...);

template<class... Args>
void print(FILE* stream, format_string<Args...> fmt, Args&&... args);
2   Effects: If the ordinary literal encoding (5.3) is UTF-8, equivalent to:
        vprint_unicode(stream, fmt.str, make_format_args(std::forward<Args>(args)...));
Otherwise, equivalent to:
        vprint_nonunicode(stream, fmt.str, make_format_args(std::forward<Args>(args)...));

template<class... Args>
void println(format_string<Args...> fmt, Args&&... args);

3   Effects: Equivalent to:
        println(stdout, fmt, std::forward<Args>(args)...);

template<class... Args>
void println(FILE* stream, format_string<Args...> fmt, Args&&... args);
4   Effects: Equivalent to:
        print(stream, "{}\n", format(fmt, std::forward<Args>(args)...));

void vprint_unicode(string_view fmt, format_args args);
5   Effects: Equivalent to:
        vprint_unicode(stdout, fmt, args);

void vprint_unicode(FILE* stream, string_view fmt, format_args args);
6   Preconditions: stream is a valid pointer to an output C stream.
7   Effects: The function initializes an automatic variable via
```

```
    string out = vformat(fmt, args);
```

If `stream` refers to a terminal capable of displaying Unicode, writes `out` to the terminal using the native Unicode API; if `out` contains invalid code units, the behavior is undefined and implementations are encouraged to diagnose it. Otherwise writes `out` to `stream` unchanged. If the native Unicode API is used, the function flushes `stream` before writing `out`.

[*Note 1*: On POSIX and Windows, `stream` referring to a terminal means that, respectively, `isatty(fileno(stream))` and `GetConsoleMode(_get_osfhandle(_fileno(stream)), ...)` return nonzero. — *end note*]

[*Note 2*: On Windows, the native Unicode API is `WriteConsoleW`. — *end note*]

8 *Throws*: Any exception thrown by the call to `vformat` (22.14.3). `system_error` if writing to the terminal or `stream` fails. May throw `bad_alloc`.

9 *Recommended practice*: If invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

```
void vprint_nonunicode(string_view fmt, format_args args);
```

10 *Effects*: Equivalent to:

```
    vprint_nonunicode(stdout, fmt, args);
```

```
void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);
```

11 *Preconditions*: `stream` is a valid pointer to an output C stream.

12 *Effects*: Writes the result of `vformat(fmt, args)` to `stream`.

13 *Throws*: Any exception thrown by the call to `vformat` (22.14.3). `system_error` if writing to `stream` fails. May throw `bad_alloc`.

31.8 String-based streams

[`string.streams`]

31.8.1 Header <`sstream`> synopsis

[`sstream.syn`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_stringbuf;

    template<class charT, class traits, class Allocator>
    void swap(basic_stringbuf<charT, traits, Allocator>& x,
              basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

    using stringbuf = basic_stringbuf<char>;
    using wstringbuf = basic_stringbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_istringstream;

    template<class charT, class traits, class Allocator>
    void swap(basic_istringstream<charT, traits, Allocator>& x,
              basic_istringstream<charT, traits, Allocator>& y);

    using istringstream = basic_istringstream<char>;
    using wistringstream = basic_istringstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_ostringstream;

    template<class charT, class traits, class Allocator>
    void swap(basic_ostringstream<charT, traits, Allocator>& x,
              basic_ostringstream<charT, traits, Allocator>& y);
```

```

using ostringstream = basic_ostringstream<char>;
using wstringstream = basic_ostringstream<wchar_t>;

template<class charT, class traits = char_traits<charT>,
         class Allocator = allocator<charT>>
class basic_stringstream;

template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
          basic_stringstream<charT, traits, Allocator>& y);

using stringstream = basic_stringstream<char>;
using wstringstream = basic_stringstream<wchar_t>;
}

```

- ¹ The header <sstream> defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 23.4.

31.8.2 Class template `basic_stringbuf`

[`stringbuf`
[`stringbuf.general`]]

```

namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringbuf : public basic_streambuf<charT, traits> {
public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type        = typename traits::pos_type;
    using off_type        = typename traits::off_type;
    using traits_type     = traits;
    using allocator_type  = Allocator;

    // 31.8.2.2, constructors
    basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
    explicit basic_stringbuf(ios_base::openmode which);
    explicit basic_stringbuf(
        const basic_string<charT, traits, Allocator>& s,
        ios_base::openmode which = ios_base::in | ios_base::out);
    explicit basic_stringbuf(const Allocator& a)
        : basic_stringbuf(ios_base::in | ios_base::out, a){}
    basic_stringbuf(ios_base::openmode which, const Allocator& a);
    explicit basic_stringbuf(
        basic_string<charT, traits, Allocator>&& s,
        ios_base::openmode which = ios_base::in | ios_base::out);
    template<class SAlloc>
    basic_stringbuf(
        const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
        : basic_stringbuf(s, ios_base::in | ios_base::out, a){}
    template<class SAlloc>
    basic_stringbuf(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which, const Allocator& a);
    template<class SAlloc>
    explicit basic_stringbuf(
        const basic_string<charT, traits, SAlloc>& s,
        ios_base::openmode which = ios_base::in | ios_base::out);
    template<class T>
    explicit basic_stringbuf(const T& t,
                           ios_base::openmode which = ios_base::in | ios_base::out);
    template<class T>
    basic_stringbuf(const T& t, const Allocator& a);
    template<class T>
    basic_stringbuf(const T& t, ios_base::openmode which, const Allocator& a);
    basic_stringbuf(const basic_stringbuf&) = delete;
}

```

```

basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);

// 31.8.2.3, assignment and swap
basic_stringbuf& operator=(const basic_stringbuf&) = delete;
basic_stringbuf& operator=(basic_stringbuf&& rhs);
void swap(basic_stringbuf& rhs) noexcept(see below);

// 31.8.2.4, getters and setters
allocator_type get_allocator() const noexcept;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
    basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
    void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
    void str(const T& t);

protected:
// 31.8.2.5, overridden virtual functions
int_type underflow() override;
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow (int_type c = traits::eof()) override;
basic_streampbuf<charT, traits>* setbuf(charT*, streamsize) override;

pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which
                 = ios_base::in | ios_base::out) override;
pos_type seekpos(pos_type sp,
                 ios_base::openmode which
                 = ios_base::in | ios_base::out) override;

private:
    ios_base::openmode mode; // exposition only
    basic_string<charT, traits, Allocator> buf; // exposition only
    void init_buf_ptrs(); // exposition only
};

}

```

- 1 The class `basic_stringbuf` is derived from `basic_streampbuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary *characters*. The sequence can be initialized from, or made available as, an object of class `basic_string`.
- 2 For the sake of exposition, the maintained data and internal pointer initialization is presented here as:
 - (2.1) — `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.
 - (2.2) — `basic_string<charT, traits, Allocator> buf` contains the underlying character sequence.
 - (2.3) — `init_buf_ptrs()` sets the base class' get area (31.6.3.4.2) and put area (31.6.3.4.3) pointers after initializing, moving from, or assigning to `buf` accordingly.

31.8.2.2 Constructors

[`stringbuf.cons`]

```
explicit basic_stringbuf(ios_base::openmode which);
```

- 1 *Effects:* Initializes the base class with `basic_streampbuf()` (31.6.3.2), and `mode` with `which`. It is implementation-defined whether the sequence pointers (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) are initialized to null pointers.

2 *Postconditions:* `str().empty()` is true.

```
explicit basic_stringbuf(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
```

3 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), `mode` with `which`, and `buf` with `s`, then calls `init_buf_ptrs()`.

basic_stringbuf(ios_base::openmode which, const Allocator &a);

4 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), `mode` with `which`, and `buf` with `a`, then calls `init_buf_ptrs()`.

5 *Postconditions:* `str().empty()` is true.

```
explicit basic_stringbuf(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in | ios_base::out);
```

6 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), `mode` with `which`, and `buf` with `std::move(s)`, then calls `init_buf_ptrs()`.

template<class SAlloc>
basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator &a);

7 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), `mode` with `which`, and `buf` with `{s,a}`, then calls `init_buf_ptrs()`.

template<class SAlloc>
explicit basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);

8 *Constraints:* `is_same_v<SAlloc, Allocator>` is false.

9 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), `mode` with `which`, and `buf` with `s`, then calls `init_buf_ptrs()`.

template<class T>
explicit basic_stringbuf(const T& t, ios_base::openmode which = ios_base::in | ios_base::out);

template<class T>
basic_stringbuf(const T& t, const Allocator& a);

template<class T>
basic_stringbuf(const T& t, ios_base::openmode which, const Allocator& a);

10 Let `which` be `ios_base::in | ios_base::out` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

11 *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

12 *Effects:* Creates a variable `sv` as if by `basic_string_view<charT, traits> sv = t`, then value-initializes the base class, initializes `mode` with `which`, and direct-non-list-initializes `buf` with `sv`, `a`, then calls `init_buf_ptrs()`.

```
basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);
```

13 *Effects:* Copy constructs the base class from `rhs` and initializes `mode` with `rhs.mode`. In the first form `buf` is initialized from `std::move(rhs).str()`. In the second form `buf` is initialized from `{std::move(rhs).str(), a}`. It is implementation-defined whether the sequence pointers in `*this (eback(), gptr(), egptr(), pbase(), pptr(), epptr())` obtain the values which `rhs` had.

14 *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

(14.1) — `str() == rhs_p.str()`

(14.2) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`

```
(14.3)    — eptr() - eback() == rhs_p.eptr() - rhs_p.eback()
(14.4)    — pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
(14.5)    — eptr() - pbase() == rhs_p.eptr() - rhs_p.pbase()
(14.6)    — if (eback()) eback() != rhs_a.eback()
(14.7)    — if (gptr()) gptr() != rhs_a.gptr()
(14.8)    — if (eptr()) eptr() != rhs_a.eptr()
(14.9)    — if (pbase()) pbase() != rhs_a.pbase()
(14.10)   — if (pptr()) pptr() != rhs_a.pptr()
(14.11)   — if (eptr()) eptr() != rhs_a.eptr()
(14.12)   — getloc() == rhs_p.getloc()
(14.13)   — rhs is empty but usable, as if std::move(rhs).str() was called.
```

31.8.2.3 Assignment and swap

[stringbuf.assign]

```
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

1 *Effects:* After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 31.8.2.2).

2 *Returns:* *this.

```
void swap(basic_stringbuf& rhs) noexcept(see below);
```

3 *Preconditions:* allocator_traits<Allocator>::propagate_on_container_swap::value is true or get_allocator() == rhs.get_allocator() is true.

4 *Effects:* Exchanges the state of *this and rhs.

5 *Remarks:* The exception specification is equivalent to:

```
allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value
```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
          basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));
```

6 *Effects:* Equivalent to x.swap(y).

31.8.2.4 Member functions

[stringbuf.members]

1 The member functions getting the underlying character sequence all refer to a `high_mark` value, where `high_mark` represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the `basic_stringbuf` passing a `basic_string` argument, or by calling one of the `str` member functions passing a `basic_string` as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new `basic_string`).

```
void init_buf_ptrs(); // exposition only
```

2 *Effects:* Initializes the input and output sequences from buf according to mode.

3 *Postconditions:*

- (3.1) — If `ios_base::out` is set in mode, `pbase()` points to `buf.front()` and `eptr() >= pbase() + buf.size()` is true;
 - (3.1.1) — in addition, if `ios_base::ate` is set in mode, `pptr() == pbase() + buf.size()` is true,
 - (3.1.2) — otherwise `pptr() == pbase()` is true.
- (3.2) — If `ios_base::in` is set in mode, `eback()` points to `buf.front()`, and `(gptr() == eback() && eptr() == eback() + buf.size())` is true.

4 [Note 1: For efficiency reasons, stream buffer operations can violate invariants of buf while it is held encapsulated in the `basic_stringbuf`, e.g., by writing to characters in the range `[buf.data() + buf.size(), buf.data() + buf.capacity()]`. All operations retrieving a `basic_string` from buf ensure that the `basic_string` invariants hold on the returned value. — end note]

```

allocator_type get_allocator() const noexcept;
5   Returns: buf.get_allocator().

basic_string<charT, traits, Allocator> str() const &;
6   Effects: Equivalent to:
      return basic_string<charT, traits, Allocator>(view(), get_allocator());

template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
7   Constraints: SAlloc is a type that qualifies as an allocator (24.2.2.2).
8   Effects: Equivalent to:
      return basic_string<charT, traits, SAlloc>(view(), sa);

basic_string<charT, traits, Allocator> str() &&;
9   Postconditions: The underlying character sequence buf is empty and pbase(), pptr(), epptr(),
                     eback(), gptr(), and egptr() are initialized as if by calling init_buf_ptrs() with an empty buf.
10  Returns: A basic_string<charT, traits, Allocator> object move constructed from the basic_
            stringbuf's underlying character sequence in buf. This can be achieved by first adjusting buf to have
            the same content as view().

basic_string_view<charT, traits> view() const noexcept;
11 Let sv be basic_string_view<charT, traits>.
12 Returns: A sv object referring to the basic_stringbuf's underlying character sequence in buf:
(12.1) — If ios_base::out is set in mode, then sv(pbase(), high_mark-pbase()) is returned.
(12.2) — Otherwise, if ios_base::in is set in mode, then sv(eback(), egptr()-eback()) is returned.
(12.3) — Otherwise, sv() is returned.
13 [Note 2: Using the returned sv object after destruction or invalidation of the character sequence underlying
 *this is undefined behavior, unless sv.empty() is true. —end note]

void str(const basic_string<charT, traits, Allocator>& s);
14 Effects: Equivalent to:
      buf = s;
      init_buf_ptrs();

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
15 Constraints: is_same_v<SAlloc, Allocator> is false.
16 Effects: Equivalent to:
      buf = s;
      init_buf_ptrs();

void str(basic_string<charT, traits, Allocator>&& s);
17 Effects: Equivalent to:
      buf = std::move(s);
      init_buf_ptrs();

template<class T>
void str(const T& t);
18 Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.
19 Effects: Equivalent to:
      basic_string_view<charT, traits> sv = t;
      buf = sv;
      init_buf_ptrs();

```

31.8.2.5 Overridden virtual functions

[`stringbuf.virtuals`]

```
int_type underflow() override;
```

- 1 *Returns:* If the input sequence has a read position available, returns `traits::to_int_type(*gptr())`. Otherwise, returns `traits::eof()`. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

- 2 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

- (2.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, assigns `gptr() - 1` to `gptr()`.

Returns: `c`.

- (2.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `*--gptr()`.

Returns: `c`.

- (2.3) — If `traits::eq_int_type(c, traits::eof())` returns `true` and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.

Returns: `traits::not_eof(c)`.

- 3 *Returns:* As specified above, or `traits::eof()` to indicate failure.

- 4 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```
int_type overflow(int_type c = traits::eof()) override;
```

- 5 *Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

- (5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.

Signals success by returning `c`.

- (5.2) — If `traits::eq_int_type(c, traits::eof())` returns `true`, there is no character to append.

Signals success by returning a value other than `traits::eof()`.

- 6 *Returns:* As specified above, or `traits::eof()` to indicate failure.

- 7 *Remarks:* The function can alter the number of write positions available as a result of any call.

- 8 The function can make a write position available only if `ios_base::out` is set in `mode`. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `ios_base::in` is set in `mode`, the function alters the read end pointer `egptr()` to point just past the new write position.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which
                 = ios_base::in | ios_base::out) override;
```

- 9 *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in [Table 126](#).

- 10 For a sequence to be positioned, the function determines `newoff` as indicated in [Table 127](#). If the sequence's next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

- 11 If $(\text{newoff} + \text{off}) < 0$, or if `newoff + off` refers to an uninitialized character ([31.8.2.4](#)), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

Table 126 — seekoff positioning [tab:stringbuf.seekoff.pos]

Conditions	Result
<code>ios_base::in</code> is set in <code>which</code>	positions the input sequence
<code>ios_base::out</code> is set in <code>which</code>	positions the output sequence
both <code>ios_base::in</code> and <code>ios_base::out</code> are set in <code>which</code> and either <code>way == ios_base::beg</code> or <code>way == ios_base::end</code>	positions both the input and the output sequences
Otherwise	the positioning operation fails.

Table 127 — newoff values [tab:stringbuf.seekoff.newoff]

Condition	newoff Value
<code>way == ios_base::beg</code>	0
<code>way == ios_base::cur</code>	the next pointer minus the beginning pointer (<code>xnext - xbeg</code>).
<code>way == ios_base::end</code>	the high mark pointer minus the beginning pointer (<code>high_mark - xbeg</code>).

12 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

13

```
pos_type seekpos(pos_type sp,
                  ios_base::openmode which
                  = ios_base::in | ios_base::out) override;
```

14 *Effects:* Equivalent to `seekoff(off_type(sp), ios_base::beg, which)`.

15 *Returns:* `sp` to indicate success, or `pos_type(off_type(-1))` to indicate failure.

16

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

17 *Effects:* implementation-defined, except that `setbuf(0, 0)` has no effect.

18 *Returns:* this.

31.8.3 Class template basic_istringstream

[istringstream]

31.8.3.1 General

[istringstream.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_istringstream : public basic_istream<charT, traits> {
public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type        = typename traits::pos_type;
    using off_type        = typename traits::off_type;
    using traits_type     = traits;
    using allocator_type = Allocator;

    // 31.8.3.2, constructors
    basic_istringstream() : basic_istringstream(ios_base::in) {}
    explicit basic_istringstream(ios_base::openmode which);
    explicit basic_istringstream(
        const basic_string<charT, traits, Allocator>& s,
        ios_base::openmode which = ios_base::in);
    basic_istringstream(ios_base::openmode which, const Allocator& a);
```

```

explicit basic_istringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in);
template<class SAlloc>
basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
: basic_istringstream(s, ios_base::in, a) {}
template<class SAlloc>
basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
template<class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);
template<class T>
explicit basic_istringstream(const T& t, ios_base::openmode which = ios_base::in);
template<class T>
basic_istringstream(const T& t, const Allocator& a);
template<class T>
basic_istringstream(const T& t, ios_base::openmode which, const Allocator& a);
basic_istringstream(const basic_istringstream&) = delete;
basic_istringstream(basic_istringstream&& rhs);

basic_istringstream& operator=(const basic_istringstream&) = delete;
basic_istringstream& operator=(basic_istringstream&& rhs);

// 31.8.3.3, swap
void swap(basic_istringstream& rhs);

// 31.8.3.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
void str(const T& t);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

}

```

¹ The class `basic_istringstream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `stringbuf` object.

31.8.3.2 Constructors

[`istringstream.cons`]

```
explicit basic_istringstream(ios_base::openmode which);
```

¹ *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (31.8.2.2).

```

explicit basic_istringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in);

2   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).

basic_istringstream(ios_base::openmode which, const Allocator& a);

3   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a) (31.8.2.2).

explicit basic_istringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in);

4   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::in) (31.8.2.2).

template<class SAlloc>
basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

5   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in, a) (31.8.2.2).

template<class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);

6   Constraints: is_same_v<SAlloc, Allocator> is false.

7   Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.5.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).

template<class T>
explicit basic_istringstream(const T& t, ios_base::openmode which = ios_base::in);
template<class T>
basic_istringstream(const T& t, const Allocator& a);
template<class T>
basic_istringstream(const T& t, ios_base::openmode which, const Allocator& a);

8   Let which be ios_base::in for the overload with no parameter which, and a be Allocator() for the
      overload with no parameter a.

9   Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.

10  Effects: Initializes the base class with addressof(sb), and direct-non-list-initializes sb with t, which
            | ios_base::in, a.

basic_istringstream(basic_istringstream&& rhs);

11  Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
            base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set_
            _rdbuf(addressof(sb)) to install the contained basic_stringbuf.

```

31.8.3.3 Swap

[[iostream.swap](#)]

```

void swap(basic_istringstream& rhs);

1   Effects: Equivalent to:
            basic_istream<charT, traits>::swap(rhs);
            sb.swap(rhs.sb);

```

```
template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
          basic_istringstream<charT, traits, Allocator>& y);
```

2 *Effects:* Equivalent to `x.swap(y)`.

31.8.3.4 Member functions

[`istringstream.members`]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1 *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(&addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

2 *Effects:* Equivalent to: `return rdbuf()->str()`;

```
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

3 *Effects:* Equivalent to: `return rdbuf()->str(sa)`;

```
basic_string<charT, traits, Allocator> str() &&;
```

4 *Effects:* Equivalent to: `return std::move(*rdbuf()).str()`;

```
basic_string_view<charT, traits> view() const noexcept;
```

5 *Effects:* Equivalent to: `return rdbuf()->view()`;

```
void str(const basic_string<charT, traits, Allocator>& s);
```

6 *Effects:* Equivalent to: `rdbuf()->str(s)`;

```
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
```

7 *Effects:* Equivalent to: `rdbuf()->str(s)`;

```
void str(basic_string<charT, traits, Allocator>&& s);
```

8 *Effects:* Equivalent to: `rdbuf()->str(std::move(s))`;

```
template<class T>
```

```
void str(const T& t);
```

9 *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

10 *Effects:* Equivalent to: `rdbuf()->str(t)`;

31.8.4 Class template `basic_ostringstream`

[`ostringstream`]

31.8.4.1 General

[`ostringstream.general`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_ostringstream : public basic_ostream<charT, traits> {
public:
    using char_type      = charT;
    using int_type       = typename traits::int_type;
    using pos_type        = typename traits::pos_type;
    using off_type        = typename traits::off_type;
    using traits_type     = traits;
    using allocator_type  = Allocator;

    // 31.8.4.2, constructors
    basic_ostringstream() : basic_ostringstream(ios_base::out) {}
    explicit basic_ostringstream(ios_base::openmode which);
    explicit basic_ostringstream(
        const basic_string<charT, traits, Allocator>& s,
        ios_base::openmode which = ios_base::out);
    basic_ostringstream(ios_base::openmode which, const Allocator& a);
```

```

explicit basic_ostringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out);
template<class SAlloc>
basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
: basic_ostringstream(s, ios_base::out, a) {}
template<class SAlloc>
basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
template<class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out);
template<class T>
explicit basic_ostringstream(const T& t, ios_base::openmode which = ios_base::out);
template<class T>
basic_ostringstream(const T& t, const Allocator& a);
template<class T>
basic_ostringstream(const T& t, ios_base::openmode which, const Allocator& a);
basic_ostringstream(const basic_ostringstream&) = delete;
basic_ostringstream(basic_ostringstream&& rhs);

basic_ostringstream& operator=(const basic_ostringstream&) = delete;
basic_ostringstream& operator=(basic_ostringstream&& rhs);

// 31.8.4.3, swap
void swap(basic_ostringstream& rhs);

// 31.8.4.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
void str(const T& t);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

}

```

¹ The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `stringbuf` object.

31.8.4.2 Constructors

[`ostringstream.cons`]

```
explicit basic_ostringstream(ios_base::openmode which);
```

¹ *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out)` (31.8.2.2).

```

explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out);

2   Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

basic_ostringstream(ios_base::openmode which, const Allocator& a);

3   Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::out, a) (31.8.2.2).

explicit basic_ostringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out);

4   Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out) (31.8.2.2).

template<class SAlloc>
basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

5   Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a) (31.8.2.2).

template<class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out);

6   Constraints: is_same_v<SAlloc, Allocator> is false.

7   Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

template<class T>
explicit basic_ostringstream(const T& t, ios_base::openmode which = ios_base::out);
template<class T>
basic_ostringstream(const T& t, const Allocator& a);
template<class T>
basic_ostringstream(const T& t, ios_base::openmode which, const Allocator& a);

8   Let which be ios_base::out for the overload with no parameter which, and a be Allocator() for
       the overload with no parameter a.

9   Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.

10  Effects: Initializes the base class with addressof(sb), and direct-non-list-initializes sb with t, which
            | ios_base::out, a.

basic_ostringstream(basic_ostringstream&& rhs);

11  Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
            base class, and the contained basic_stringbuf. Then calls basic_ostream<charT, traits>::set_
            _rdbuf(addressof(sb)) to install the contained basic_stringbuf.

```

31.8.4.3 Swap

[`ostringstream.swap`]

```

void swap(basic_ostringstream& rhs);

1   Effects: Equivalent to:
            basic_ostream<charT, traits>::swap(rhs);
            sb.swap(rhs.sb);

```

```
template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
          basic_ostringstream<charT, traits, Allocator>& y);
```

2 *Effects:* Equivalent to `x.swap(y)`.

31.8.4.4 Member functions

[`ostringstream.members`]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1 *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(&addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

2 *Effects:* Equivalent to: `return rdbuf()->str()`;

```
template<class SAlloc>
```

```
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

3 *Effects:* Equivalent to: `return rdbuf()->str(sa)`;

```
basic_string<charT, traits, Allocator> str() &&;
```

4 *Effects:* Equivalent to: `return std::move(*rdbuf()).str()`;

```
basic_string_view<charT, traits> view() const noexcept;
```

5 *Effects:* Equivalent to: `return rdbuf()->view()`;

```
void str(const basic_string<charT, traits, Allocator>& s);
```

6 *Effects:* Equivalent to: `rdbuf()->str(s)`;

```
template<class SAlloc>
```

```
void str(const basic_string<charT, traits, SAlloc>& s);
```

7 *Effects:* Equivalent to: `rdbuf()->str(s)`;

```
void str(basic_string<charT, traits, Allocator>&& s);
```

8 *Effects:* Equivalent to: `rdbuf()->str(std::move(s))`;

```
template<class T>
```

```
void str(const T& t);
```

9 *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

10 *Effects:* Equivalent to: `rdbuf()->str(t)`;

31.8.5 Class template `basic_stringstream`

[`stringstream`]

31.8.5.1 General

[`stringstream.general`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>,
              class Allocator = allocator<charT>>
    class basic_stringstream : public basic_iostream<charT, traits> {
        public:
            using char_type      = charT;
            using int_type       = typename traits::int_type;
            using pos_type       = typename traits::pos_type;
            using off_type       = typename traits::off_type;
            using traits_type    = traits;
            using allocator_type = Allocator;

            // 31.8.5.2, constructors
            basic_stringstream() : basic_stringstream(ios_base::out | ios_base::in) {}
            explicit basic_stringstream(ios_base::openmode which);
            explicit basic_stringstream(
                const basic_string<charT, traits, Allocator>& s,
                ios_base::openmode which = ios_base::out | ios_base::in);
            basic_stringstream(ios_base::openmode which, const Allocator& a);
```

```

explicit basic_stringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
template<class SAlloc>
basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
: basic_stringstream(s, ios_base::out | ios_base::in, a) {}
template<class SAlloc>
basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);
template<class SAlloc>
explicit basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
template<class T>
explicit basic_stringstream(const T& t,
                           ios_base::openmode which = ios_base::out | ios_base::in);
template<class T>
basic_stringstream(const T& t, const Allocator& a);
template<class T>
basic_stringstream(const T& t, ios_base::openmode which, const Allocator& a);
basic_stringstream(const basic_stringstream&) = delete;
basic_stringstream(basic_stringstream&& rhs);

basic_stringstream& operator=(const basic_stringstream&) = delete;
basic_stringstream& operator=(basic_stringstream&& rhs);

// 31.8.5.3, swap
void swap(basic_stringstream& rhs);

// 31.8.5.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
void str(const T& t);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

}

```

¹ The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

(1.1) — `sb`, the `stringbuf` object.

31.8.5.2 Constructors

[`stringstream.cons`]

```
explicit basic_stringstream(ios_base::openmode which);
```

¹ *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`.

```

explicit basic_stringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
2   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which).

basic_stringstream(ios_base::openmode which, const Allocator& a);

3   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(which, a) (31.8.2.2).

explicit basic_stringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
4   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which) (31.8.2.2).

template<class SAlloc>
basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

5   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which, a) (31.8.2.2).

template<class SAlloc>
explicit basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);

6   Constraints: is_same_v<SAlloc, Allocator> is false.

7   Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) (31.7.5.7.2)
            and sb with basic_stringbuf<charT, traits, Allocator>(s, which) (31.8.2.2).

template<class T>
explicit basic_stringstream(const T& t, ios_base::openmode which = ios_base::out | ios_base::in);
template<class T>
basic_stringstream(const T& t, const Allocator& a);
template<class T>
basic_stringstream(const T& t, ios_base::openmode which, const Allocator& a);

8   Let which be ios_base::out | ios_base::in for the overload with no parameter which, and a be
      Allocator() for the overload with no parameter a.

9   Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.

10  Effects: Initializes the base class with addressof(sb), and direct-non-list-initializes sb with t, which,
            a.

basic_stringstream(basic_stringstream&& rhs);

11  Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
            base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set_
            _rdbuf(addressof(sb)) to install the contained basic_stringbuf.

```

31.8.5.3 Swap

[stringstream.swap]

```

void swap(basic_stringstream& rhs);

1   Effects: Equivalent to:

        basic_iostream<charT, traits>::swap(rhs);
        sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
          basic_stringstream<charT, traits, Allocator>& y);

2   Effects: Equivalent to x.swap(y).

```

31.8.5.4 Member functions

[**stringstream.members**]

```

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
1   Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

basic_string<charT, traits, Allocator> str() const &;
2   Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;
3   Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT,traits,Allocator> str() &&;
4   Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<charT, traits> view() const noexcept;
5   Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<charT, traits, Allocator>& s);
6   Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
7   Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);
8   Effects: Equivalent to: rdbuf()->str(std::move(s));

template<class T>
void str(const T&);

9   Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.
10  Effects: Equivalent to: rdbuf()->str(t);

```

31.9 Span-based streams

[**span.streams**]

31.9.1 Overview

[**span.streams.overview**]

- ¹ The header `<spanstream>` defines class templates and types that associate stream buffers with objects whose types are specializations of `span` as described in [24.7.2.2](#).

[*Note 1:* A user of these classes is responsible for ensuring that the character sequence represented by the given `span` outlives the use of the sequence by objects of the classes in subclause [31.9](#). Using multiple `basic_spanbuf` objects referring to overlapping underlying sequences from different threads, where at least one `basic_spanbuf` object is used for writing to the sequence, results in a data race. — *end note*]

31.9.2 Header `<spanstream>` synopsis[**spanstream.syn**]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_spanbuf;

    template<class charT, class traits>
        void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

    using spanbuf = basic_spanbuf<char>;
    using wspanbuf = basic_spanbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_ispanstream;

    template<class charT, class traits>
        void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

```

```

using ispanstream = basic_ispanstream<char>;
using wispanstream = basic_ispanstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
class basic_ospanstream;

template<class charT, class traits>
void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

using ospanstream = basic_ospanstream<char>;
using wospanstream = basic_ospanstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
class basic_spanstream;

template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);

using spanstream = basic_spanstream<char>;
using wspanstream = basic_spanstream<wchar_t>;
}

```

31.9.3 Class template basic_spanbuf

[spanbuf]

31.9.3.1 General

[spanbuf.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanbuf
        : public basic_streambuf<charT, traits> {
    public:
        using char_type     = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type   = traits;

        // 31.9.3.2, constructors
        basic_spanbuf() : basic_spanbuf(ios_base::in | ios_base::out) {}
        explicit basic_spanbuf(ios_base::openmode which)
            : basic_spanbuf(std::span<charT>(), which) {}
        explicit basic_spanbuf(std::span<charT> s,
                               ios_base::openmode which = ios_base::in | ios_base::out);
        basic_spanbuf(const basic_spanbuf&) = delete;
        basic_spanbuf(basic_spanbuf&& rhs);

        // 31.9.3.3, assignment and swap
        basic_spanbuf& operator=(const basic_spanbuf&) = delete;
        basic_spanbuf& operator=(basic_spanbuf&& rhs);
        void swap(basic_spanbuf& rhs);

        // 31.9.3.4, member functions
        std::span<charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;

    protected:
        // 31.9.3.5, overridden virtual functions
        basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;
        pos_type seekoff(off_type off, ios_base::seekdir way,
                         ios_base::openmode which = ios_base::in | ios_base::out) override;
        pos_type seekpos(pos_type sp,
                         ios_base::openmode which = ios_base::in | ios_base::out) override;

    private:
        ios_base::openmode mode;           // exposition only

```

```
    std::span<charT> buf; // exposition only
};
```

¹ The class template `basic_spanbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence is provided by an object of class `span<charT>`.

² For the sake of exposition, the maintained data is presented here as:

- (2.1) — `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.
- (2.2) — `std::span<charT> buf` is the view to the underlying character sequence.

31.9.3.2 Constructors

[spanbuf.cons]

```
explicit basic_spanbuf(std::span<charT> s,
                      ios_base::openmode which = ios_base::in | ios_base::out);
```

¹ *Effects*: Initializes the base class with `basic_streambuf()` (31.6.3.2), and `mode` with `which`. Initializes the internal pointers as if calling `span(s)`.

```
basic_spanbuf(basic_spanbuf&& rhs);
```

² *Effects*: Initializes the base class with `std::move(rhs)` and `mode` with `std::move(rhs.mode)` and `buf` with `std::move(rhs.buf)`. The sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. It is implementation-defined whether `rhs.buf.empty()` returns `true` after the move.

³ *Postconditions*: Let `rhs_p` refer to the state of `rhs` just prior to this construction.

- (3.1) — `span().data() == rhs_p.span().data()`
- (3.2) — `span().size() == rhs_p.span().size()`
- (3.3) — `eback() == rhs_p.eback()`
- (3.4) — `gptr() == rhs_p.gptr()`
- (3.5) — `egptr() == rhs_p.egptr()`
- (3.6) — `pbase() == rhs_p.pbase()`
- (3.7) — `pptr() == rhs_p.pptr()`
- (3.8) — `epptr() == rhs_p.epptr()`
- (3.9) — `getloc() == rhs_p.getloc()`

31.9.3.3 Assignment and swap

[spanbuf.assign]

```
basic_spanbuf& operator=(basic_spanbuf&& rhs);
```

¹ *Effects*: Equivalent to:

```
basic_spanbuf tmp{std::move(rhs)};
this->swap(tmp);
return *this;
```

```
void swap(basic_spanbuf& rhs);
```

² *Effects*: Equivalent to:

```
basic_streambuf<charT, traits>::swap(rhs);
std::swap(mode, rhs.mode);
std::swap(buf, rhs.buf);
```

```
template<class charT, class traits>
void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);
```

³ *Effects*: Equivalent to `x.swap(y)`.

31.9.3.4 Member functions

[spanbuf.members]

```
std::span<charT> span() const noexcept;
```

1 *Returns:* If `ios_base::out` is set in `mode`, returns `std::span<charT>(pbase(), pptr())`, otherwise returns `buf`.

[*Note 1:* In contrast to `basic_stringbuf`, the underlying sequence never grows and is not owned. An owning copy can be obtained by converting the result to `basic_string<charT>`. —end note]

```
void span(std::span<charT> s) noexcept;
```

2 *Effects:* `buf = s`. Initializes the input and output sequences according to `mode`.

3 *Postconditions:*

- (3.1) — If `ios_base::out` is set in `mode`, `pbase() == s.data() && eptr() == pbase() + s.size()` is true;
 - (3.1.1) — in addition, if `ios_base::ate` is set in `mode`, `pptr() == pbase() + s.size()` is true,
 - (3.1.2) — otherwise `pptr() == pbase()` is true.
- (3.2) — If `ios_base::in` is set in `mode`, `eback() == s.data() && gptr() == eback() && egptr() == eback() + s.size()` is true.

31.9.3.5 Overridden virtual functions

[`spanbuf.virtuals`]

1 [*Note 1:* Because the underlying buffer is of fixed size, neither `overflow`, `underflow`, nor `pbackfail` can provide useful behavior. —end note]

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which = ios_base::in | ios_base::out) override;
```

2 *Effects:* Alters the stream position within one or both of the controlled sequences, if possible, as follows:

- (2.1) — If `ios_base::in` is set in `which`, positions the input sequence; `xnext` is `gptr()`, `xbeg` is `eback()`.
- (2.2) — If `ios_base::out` is set in `which`, positions the output sequence; `xnext` is `pptr()`, `xbeg` is `pbase()`.

3 If both `ios_base::in` and `ios_base::out` are set in `which` and `way` is `ios_base::cur`, the positioning operation fails.

4 For a sequence to be positioned, if its next pointer `xnext` (either `gptr()` or `pptr()`) is a null pointer and the new offset `newoff` as computed below is nonzero, the positioning operation fails. Otherwise, the function determines `baseoff` as a value of type `off_type` as follows:

- (4.1) — 0 when `way` is `ios_base::beg`;
- (4.2) — `(pptr() - pbase())` for the output sequence, or `(gptr() - eback())` for the input sequence when `way` is `ios_base::cur`;
- (4.3) — when `way` is `ios_base::end` :
 - (4.3.1) — `(pptr() - pbase())` if `ios_base::out` is set in `mode` and `ios_base::in` is not set in `mode`,
 - (4.3.2) — `buf.size()` otherwise.

5 If `baseoff + off` would overflow, or if `baseoff + off` is less than zero, or if `baseoff + off` is greater than `buf.size()`, the positioning operation fails. Otherwise, the function computes

```
off_type newoff = baseoff + off;
```

and assigns `xbeg + newoff` to the next pointer `xnext`.

6 *Returns:* `pos_type(off_type(-1))` if the positioning operation fails; `pos_type(newoff)` otherwise.

```
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

7 *Effects:* Equivalent to:

```
return seekoff(off_type(sp), ios_base::beg, which);
```

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

8 *Effects:* Equivalent to:

```
this->span(std::span<charT>(s, n));
return this;
```

31.9.4 Class template `basic_ispanstream`

[`ispanstream`]

31.9.4.1 General

[`ispanstream.general`]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream
        : public basic_istream<charT, traits> {
    public:
        using char_type     = charT;
        using int_type      = typename traits::int_type;
        using pos_type      = typename traits::pos_type;
        using off_type      = typename traits::off_type;
        using traits_type   = traits;

        // 31.9.4.2, constructors
        explicit basic_ispanstream(std::span<charT> s,
                                    ios_base::openmode which = ios_base::in);
        basic_ispanstream(const basic_ispanstream&) = delete;
        basic_ispanstream(basic_ispanstream&& rhs);
        template<class ROS> explicit basic_ispanstream(ROS&& s);

        basic_ispanstream& operator=(const basic_ispanstream&) = delete;
        basic_ispanstream& operator=(basic_ispanstream&& rhs);

        // 31.9.4.3, swap
        void swap(basic_ispanstream& rhs);

        // 31.9.4.4, member functions
        basic_spanbuf<charT, traits>* rdbuf() const noexcept;

        std::span<const charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;
        template<class ROS> void span(ROS&& s) noexcept;

    private:
        basic_spanbuf<charT, traits> sb;      // exposition only
    };
}

```

¹ [Note 1: Constructing an `ispanstream` from a *string-literal* includes the termination character '\0' in the underlying `spanbuf`. —end note]

31.9.4.2 Constructors

[`ispanstream.cons`]

- ```
explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);
```
- <sup>1</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which | ios_base::in)` (31.9.3.2).
- ```
basic_ispanstream(basic_ispanstream&& rhs);
```
- ² *Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.
- ```
template<class ROS> explicit basic_ispanstream(ROS&& s)
```
- <sup>3</sup> *Constraints:* `ROS` models `ranges::borrowed_range`. `!convertible_to<ROS, std::span<charT>>` && `convertible_to<ROS, std::span<charT const>>` is true.
- <sup>4</sup> *Effects:* Let `sp` be `std::span<const charT>(std::forward<ROS>(s))`. Equivalent to:
- ```
basic_ispanstream(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))
```

31.9.4.3 Swap

[`ispanstream.swap`]

```
void swap(basic_ispanstream& rhs);
```

- ¹ *Effects:* Equivalent to:

```

    basic_istream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

template<class charT, class traits>
void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);
2   Effects: Equivalent to x.swap(y).

```

31.9.4.4 Member functions

[ispanstream.members]

```

basic_spanbuf<charT, traits>* rdbuf() const noexcept;
1   Effects: Equivalent to:
            return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

std::span<const charT> span() const noexcept;
2   Effects: Equivalent to: return rdbuf()->span();

void span(std::span<charT> s) noexcept;
3   Effects: Equivalent to rdbuf()->span(s).

template<class ROS> void span(ROS&& s) noexcept;
4   Constraints: ROS models ranges::borrowed_range. (!convertible_to<ROS, std::span<charT>>
&& convertible_to<ROS, std::span<const charT>> is true.

5   Effects: Let sp be std::span<const charT>(std::forward<ROS>(s)). Equivalent to:
            this->span(std::span<charT>(const_cast<charT*>(sp.data()), sp.size())));

```

31.9.5 Class template basic_ospanstream

[ospanstream]

31.9.5.1 General

[ospanstream.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ospanstream
        : public basic_ostream<charT, traits> {
    public:
        using char_type    = charT;
        using int_type     = typename traits::int_type;
        using pos_type     = typename traits::pos_type;
        using off_type     = typename traits::off_type;
        using traits_type  = traits;

        // 31.9.5.2, constructors
        explicit basic_ospanstream(std::span<charT> s,
                                   ios_base::openmode which = ios_base::out);
        basic_ospanstream(const basic_ospanstream&) = delete;
        basic_ospanstream(basic_ospanstream&& rhs);

        basic_ospanstream& operator=(const basic_ospanstream&) = delete;
        basic_ospanstream& operator=(basic_ospanstream&& rhs);

        // 31.9.5.3, swap
        void swap(basic_ospanstream& rhs);

        // 31.9.5.4, member functions
        basic_spanbuf<charT, traits>* rdbuf() const noexcept;

        std::span<charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;

    private:
        basic_spanbuf<charT, traits> sb;      // exposition only
    };
}

```

31.9.5.2 Constructors

[ospanstream.cons]

```
explicit basic_ospanstream(std::span<charT> s,
                           ios_base::openmode which = ios_base::out);
```

1 *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which | ios_base::out)` (31.9.3.2).

```
basic_ospanstream(basic_ospanstream&& rhs) noexcept;
```

2 *Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

31.9.5.3 Swap

[ospanstream.swap]

```
void swap(basic_ospanstream& rhs);
```

1 *Effects:* Equivalent to:

```
basic_ostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits>
void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);
```

2 *Effects:* Equivalent to `x.swap(y)`.

31.9.5.4 Member functions

[ospanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

1 *Effects:* Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<charT> span() const noexcept;
```

2 *Effects:* Equivalent to: `return rdbuf()->span()`;

```
void span(std::span<charT> s) noexcept;
```

3 *Effects:* Equivalent to `rdbuf()->span(s)`.

31.9.6 Class template basic_spanstream

[spanstream]

31.9.6.1 General

[spanstream.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanstream
        : public basic_iostream<charT, traits> {
    public:
        using char_type    = charT;
        using int_type     = typename traits::int_type;
        using pos_type     = typename traits::pos_type;
        using off_type     = typename traits::off_type;
        using traits_type  = traits;

        // 31.9.6.2, constructors
        explicit basic_spanstream(std::span<charT> s,
                                  ios_base::openmode which = ios_base::out | ios_base::in);
        basic_spanstream(const basic_spanstream&) = delete;
        basic_spanstream(basic_spanstream&& rhs);

        basic_spanstream& operator=(const basic_spanstream&) = delete;
        basic_spanstream& operator=(basic_spanstream&& rhs);

        // 31.9.6.3, swap
        void swap(basic_spanstream& rhs);
    };
}
```

```
// 31.9.6.4, members
basic_spanbuf<charT, traits>* rdbuf() const noexcept;

std::span<charT> span() const noexcept;
void span(std::span<charT> s) noexcept;

private:
    basic_spanbuf<charT, traits> sb; // exposition only
};

}
```

31.9.6.2 Constructors

[spanstream.cons]

```
explicit basic_spanstream(std::span<charT> s,
                           ios_base::openmode which = ios_base::out | ios_base::in);
```

- 1 *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which)` (31.9.3.2).

```
basic_spanstream(basic_spanstream&& rhs);
```

- 2 *Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_iostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

31.9.6.3 Swap

[spanstream.swap]

```
void swap(basic_spanstream& rhs);
```

- 1 *Effects:* Equivalent to:

```
basic_iostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);
```

- 2 *Effects:* Equivalent to `x.swap(y)`.

31.9.6.4 Member functions

[spanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

- 1 *Effects:* Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<charT> span() const noexcept;
```

- 2 *Effects:* Equivalent to: `return rdbuf()->span()`;

```
void span(std::span<charT> s) noexcept;
```

- 3 *Effects:* Equivalent to `rdbuf()->span(s)`.

31.10 File-based streams

[file.streams]

31.10.1 Header <fstream> synopsis

[fstream.syn]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf;

    template<class charT, class traits>
    void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

    using filebuf = basic_filebuf<char>;
    using wfilebuf = basic_filebuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream;
```

```

template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

using ifstream = basic_ifstream<char>;
using wifstream = basic_ifstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
class basic_ofstream;

template<class charT, class traits>
void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);

using ofstream = basic_ofstream<char>;
using wofstream = basic_ofstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
class basic_fstream;

template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x, basic_fstream<charT, traits>& y);

using fstream = basic_fstream<char>;
using wfstream = basic_fstream<wchar_t>;
}

```

- 1 The header `<fstream>` defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.
- 2 [Note 1: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences. — *end note*]
- 3 In subclause 31.10, member functions taking arguments of `const filesystem::path::value_type*` are only provided on systems where `filesystem::path::value_type` (31.12.6) is not `char`.
[Note 2: These functions enable class path support for systems with a wide native path character type, such as `wchar_t`. — *end note*]

31.10.2 Native handles

[file.native]

- 1 Several classes described in 31.10 have a member `native_handle_type`.
- 2 The type `native_handle_type` represents a platform-specific *native handle* to a file. It is trivially copyable and models `semiregular`.

[Note 1: For operating systems based on POSIX, `native_handle_type` is `int`. For Windows-based operating systems, `native_handle_type` is `HANDLE`. — *end note*]

31.10.3 Class template `basic_filebuf`

[filebuf]

31.10.3.1 General

[filebuf.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using native_handle_type = implementation-defined; // see 31.10.2

            // 31.10.3.2, constructors/destructor
            basic_filebuf();
            basic_filebuf(const basic_filebuf&) = delete;
            basic_filebuf(basic_filebuf&& rhs);
            virtual ~basic_filebuf();
    }
}

```

```

// 31.10.3.3, assignment and swap
basic_filebuf& operator=(const basic_filebuf&) = delete;
basic_filebuf& operator=(basic_filebuf&& rhs);
void swap(basic_filebuf& rhs);

// 31.10.3.4, members
bool is_open() const;
basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s,
                    ios_base::openmode mode); // wide systems only; see 31.10.1
basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
basic_filebuf* close();
native_handle_type native_handle() const noexcept;

protected:
// 31.10.3.5, overridden virtual functions
streamsize showmany() override;
int_type underflow() override;
int_type uflow() override;
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow (int_type c = traits::eof()) override;

basic_streambuf<charT, traits>* setbuf(char_type* s, streamsize n) override;

pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which = ios_base::in | ios_base::out) override;
pos_type seekpos(pos_type sp,
                 ios_base::openmode which = ios_base::in | ios_base::out) override;

int sync() override;
void imbue(const locale& loc) override;
};

}

```

- ¹ The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file.
- ² The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the C standard library FILEs.
- ³ In particular:
 - (3.1) — If the file is not open for reading the input sequence cannot be read.
 - (3.2) — If the file is not open for writing the output sequence cannot be written.
 - (3.3) — A joint file position is maintained for both the input sequence and the output sequence.
- ⁴ An instance of `basic_filebuf` behaves as described in 31.10.3 provided `traits::pos_type` is `fpos<traits::state_type>`. Otherwise the behavior is undefined.
- ⁵ The file associated with a `basic_filebuf` has an associated value of type `native_handle_type`, called the native handle (31.10.2) of that file. This native handle can be obtained by calling the member function `native_handle`.
- ⁶ For any opened `basic_filebuf f`, the native handle returned by `f.native_handle()` is invalidated when `f.close()` is called, or `f` is destroyed.
- ⁷ In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as `a_codecvt` in following subclauses, obtained as if by

```
const codecvt<charT, char, typename traits::state_type>& a_codecvt =
  use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());
```

31.10.3.2 Constructors

[filebuf.cons]

```
basic_filebuf();
```

- ¹ *Effects:* Initializes the base class with `basic_streambuf<charT, traits>()` (31.6.3.2).

2 *Postconditions:* `is_open() == false.`

```
basic_filebuf(basic_filebuf&& rhs);
```

3 *Effects:* It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. Additionally `*this` references the file which `rhs` did before the construction, and `rhs` references no file after the construction. The openmode, locale and any other state of `rhs` is also copied.

4 *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

- (4.1) — `is_open() == rhs_p.is_open()`
- (4.2) — `rhs_a.is_open() == false`
- (4.3) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
- (4.4) — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
- (4.5) — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
- (4.6) — `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`
- (4.7) — `if (eback()) eback() != rhs_a.eback()`
- (4.8) — `if (gptr()) gptr() != rhs_a.gptr()`
- (4.9) — `if (egptr()) egptr() != rhs_a.egptr()`
- (4.10) — `if (pbase()) pbase() != rhs_a.pbase()`
- (4.11) — `if (pptr()) pptr() != rhs_a.pptr()`
- (4.12) — `if (epptr()) epptr() != rhs_a.epptr()`

```
virtual ~basic_filebuf();
```

5 *Effects:* Calls `close()`. If an exception occurs during the destruction of the object, including the call to `close()`, the exception is caught but not rethrown (see [16.4.6.13](#)).

31.10.3.3 Assignment and swap

[[filebuf.assign](#)]

```
basic_filebuf& operator=(basic_filebuf&& rhs);
```

1 *Effects:* Calls `close()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see [31.10.3.2](#)).

2 *Returns:* `*this`.

```
void swap(basic_filebuf& rhs);
```

3 *Effects:* Exchanges the state of `*this` and `rhs`.

```
template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);
```

4 *Effects:* Equivalent to `x.swap(y)`.

31.10.3.4 Member functions

[[filebuf.members](#)]

```
bool is_open() const;
```

1 *Returns:* `true` if a previous call to `open` succeeded (returned a non-null value) and there has been no intervening call to `close`.

```
basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s,
                    ios_base::openmode mode); // wide systems only; see 31.10.1
```

2 *Preconditions:* `s` points to a NTCTS ([3.34](#)).

3 *Effects:* If `is_open() != false`, returns a null pointer. Otherwise, initializes the `filebuf` as required. It then opens the file to which `s` resolves, if possible, as if by a call to `fopen` with the second argument

determined from `mode & ~ios_base::ate` as indicated in [Table 128](#). If `mode` is not some combination of flags shown in the table then the open fails.

Table 128 — File open modes [tab:filebuf.open.modes]

ios_base flag combination					stdio equivalent
binary	in	out	trunc	app	noreplace
			+		"w"
			+	+	"wx"
		+	+		"w"
		+	+	+	"wx"
		+		+	"a"
				+	"a"
					"r"
		+	+		"r+"
		+	+	+	"w+"
		+	+	+	"w+x"
		+		+	"a+"
				+	"a+"
	+	+			"wb"
	+	+		+	"wbx"
	+	+	+		"wb"
	+	+	+	+	"wbx"
	+	+		+	"ab"
	+			+	"ab"
	+	+			"rb"
	+	+	+		"r+b"
	+	+	+	+	"w+b"
	+	+	+	+	"w+bx"
	+	+		+	"a+b"
	+	+		+	"a+b"

- 4 If the open operation succeeds and `ios_base::ate` is set in `mode`, positions the file to the end (as if by calling `fseek(file, 0, SEEK_END)`, where `file` is the pointer returned by calling `fopen`).³⁰¹
- 5 If the repositioning operation fails, calls `close()` and returns a null pointer to indicate failure.
- 6 *Returns:* `this` if successful, a null pointer otherwise.

```
basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
```

7 *Returns:* `open(s.c_str(), mode);`

- 8 *Effects:* If `is_open() == false`, returns a null pointer. If a put area exists, calls `overflow(traits::eof())` to flush characters. If the last virtual member function called on `*this` (between `underflow`, `overflow`, `seekoff`, and `seekpos`) was `overflow` then calls `a_codecvt.unshift` (possibly several times) to determine a termination sequence, inserts those characters and calls `overflow(traits::eof())` again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling `fclose(file)`). If any of the calls made by the function, including `fclose`, fails, `close` fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

- 9 *Postconditions:* `is_open() == false`.

- 10 *Returns:* `this` on success, a null pointer otherwise.

³⁰¹) The macro `SEEK_END` is defined, and the function signatures `fopen(const char*, const char*)` and `fseek(FILE*, long, int)` are declared, in `<cstdio>` ([31.13.1](#)).

```
native_handle_type native_handle() const noexcept;
11   Preconditions: is_open() is true.
12   Returns: The native handle associated with *this.
```

31.10.3.5 Overridden virtual functions

[`filebuf.virtuals`]

```
streamsize showmany() override;
```

1 *Effects:* Behaves the same as `basic_streambuf::showmany()` ([31.6.3.5](#)).

2 *Remarks:* An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

```
int_type underflow() override;
```

3 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::underflow()`, with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (`extern_buf`) and then as if by doing:

```
char extern_buf[XSIZE];
char* extern_end;
charT intern_buf[ISIZE];
charT* intern_end;
codecvt_base::result r =
    a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
                  intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (`fpos_t`) corresponding to each character between `intern_buf` and `intern_end`. If the value of `r` indicates that `a_codecvt.in()` ran out of space in `intern_buf`, retry with a larger `intern_buf`.

```
int_type uflow() override;
```

4 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

5 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(5.1) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, decrements the next pointer for the input sequence, `gptr()`.

Returns: `c`.

(5.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.

Returns: `c`.

(5.3) — If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.

Returns: `traits::not_eof(c)`.

6 *Returns:* As specified above, or `traits::eof()` to indicate failure.

7 *Remarks:* If `is_open() == false`, the function always fails.

8 The function does not put back a character directly to the input sequence.

9 If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type overflow(int_type c = traits::eof()) override;
```

10 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of “consuming characters” is performed by first converting as if by:

```

charT* b = pbase();
charT* p = pptr();
charT* end;
char xbuf[XSIZE];
char* xbuf_end;
codecvt_base::result r =
    a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);

```

and then

- (10.1) — If $r == \text{codecvt_base}::\text{error}$ then fail.
- (10.2) — If $r == \text{codecvt_base}::\text{noconv}$ then output characters from b up to (and not including) p .
- (10.3) — If $r == \text{codecvt_base}::\text{partial}$ then output to the file characters from $xbuf$ up to $xbuf_end$, and repeat using characters from end to p . If output fails, fail (without repeating).
- (10.4) — Otherwise output from $xbuf$ to $xbuf_end$, and fail if output fails. At this point if $b != p$ and $b == \text{end}$ ($xbuf$ isn't large enough) then increase $XSIZE$ and repeat from the beginning.

11 *Returns*: `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_open() == false`, the function always fails.

```
basic_streambuf* setbuf(char_type* s, streamsize n) override;
```

12 *Effects*: If `setbuf(0, 0)` is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.

```

pos_type seekoff(off_type off, ios_base::seekdir way,
                  ios_base::openmode which
                  = ios_base::in | ios_base::out) override;

```

13 *Effects*: Let `width` denote `a_codecvt.encoding()`. If `is_open() == false`, or `off != 0 && width <= 0, then the positioning operation fails. Otherwise, if way != basic_ios::cur or off != 0, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if width > 0, call fseek(file, width * off, whence), otherwise call fseek(file, 0, whence).`

14 *Returns*: A newly constructed `pos_type` object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns `pos_type(off_type(-1))`.

15 *Remarks*: “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if `width` is less than zero then call `a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end)` and output the resulting unshift sequence. The function determines one of three values for the argument `whence`, of type `int`, as indicated in [Table 129](#).

Table 129 — seekoff effects [tab:filebuf.seekoff]

way Value	stdio Equivalent
<code>basic_ios::beg</code>	<code>SEEK_SET</code>
<code>basic_ios::cur</code>	<code>SEEK_CUR</code>
<code>basic_ios::end</code>	<code>SEEK_END</code>

```

pos_type seekpos(pos_type sp,
                  ios_base::openmode which
                  = ios_base::in | ios_base::out) override;

```

16 Alters the file position, if possible, to correspond to the position stored in `sp` (as described below). Altering the file position performs as follows:

1. if `(om & ios_base::out) != 0`, then update the output sequence and write any unshift sequence;
2. set the file position to `sp` as if by a call to `fsetpos`;
3. if `(om & ios_base::in) != 0`, then update the input sequence;

where `om` is the open mode passed to the last call to `open()`. The operation fails if `is_open()` returns `false`.

17 If `sp` is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If `sp` has not been obtained by a previous successful call to one of the positioning functions (`seekoff` or `seekpos`) on the same file the effects are undefined.

18 *Returns:* `sp` on success. Otherwise returns `pos_type(off_type(-1))`.

```
int sync() override;
```

19 *Effects:* If a put area exists, calls `filebuf::overflow` to write the characters to the file, then flushes the file as if by calling `fflush(file)`. If a get area exists, the effect is implementation-defined.

```
void imbue(const locale& loc) override;
```

20 *Preconditions:* If the file is not positioned at its beginning and the encoding of the current locale as determined by `a_codecvt.encoding()` is state-dependent (30.4.2.5.3) then that facet is the same as the corresponding facet of `loc`.

21 *Effects:* Causes characters inserted or extracted after this call to be converted according to `loc` until another call of `imbue`.

22 *Remarks:* This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

31.10.4 Class template `basic_ifstream`

31.10.4.1 General

[`ifstream`]

[`ifstream.general`]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream : public basic_istream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using native_handle_type = typename basic_filebuf<charT, traits>::native_handle_type;

            // 31.10.4.2, constructors
            basic_ifstream();
            explicit basic_ifstream(const char* s,
                                   ios_base::openmode mode = ios_base::in);
            explicit basic_ifstream(const filesystem::path::value_type* s,
                                   ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
            explicit basic_ifstream(const string& s,
                                   ios_base::openmode mode = ios_base::in);
            template<class T>
            explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
            basic_ifstream(const basic_ifstream&) = delete;
            basic_ifstream(basic_ifstream&& rhs);

            basic_ifstream& operator=(const basic_ifstream&) = delete;
            basic_ifstream& operator=(basic_ifstream&& rhs);

            // 31.10.4.3, swap
            void swap(basic_ifstream& rhs);

            // 31.10.4.4, members
            basic_filebuf<charT, traits>* rdbuf() const;
            native_handle_type native_handle() const noexcept;

            bool is_open() const;
            void open(const char* s, ios_base::openmode mode = ios_base::in);
            void open(const filesystem::path::value_type* s,
                      ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
```

```

    void open(const string& s, ios_base::openmode mode = ios_base::in);
    void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
    void close();

private:
    basic_filebuf<charT, traits> sb;      // exposition only
};

}

```

- 1 The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `filebuf` object.

31.10.4.2 Constructors

[ifstream.cons]

```
basic_ifstream();
```

- 1 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` ([31.7.5.2.2](#)) and `sb` with `basic_filebuf<charT, traits>()` ([31.10.3.2](#)).

```

explicit basic_ifstream(const char* s,
                        ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
                        ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1

```

- 2 *Effects*: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` ([31.7.5.2.2](#)) and `sb` with `basic_filebuf<charT, traits>()` ([31.10.3.2](#)), then calls `rdbuf()>open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ifstream(const string& s,
                        ios_base::openmode mode = ios_base::in);
```

- 3 *Effects*: Equivalent to `basic_ifstream(s.c_str(), mode)`.

```
template<class T>
explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
```

- 4 *Constraints*: `is_same_v<T, filesystem::path>` is true.

- 5 *Effects*: Equivalent to `basic_ifstream(s.c_str(), mode)`.

```
basic_ifstream(basic_ifstream&& rhs);
```

- 6 *Effects*: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

31.10.4.3 Swap

[ifstream.swap]

```
void swap(basic_ifstream& rhs);
```

- 1 *Effects*: Exchanges the state of `*this` and `rhs` by calling `basic_istream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);
```

- 2 *Effects*: Equivalent to `x.swap(y)`.

31.10.4.4 Member functions

[ifstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

- 1 *Returns*: `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
native_handle_type native_handle() const noexcept;
```

- 2 *Effects*: Equivalent to: `return rdbuf()>native_handle()`;

```
bool is_open() const;
```

- 3 *Returns*: `rdbuf()>is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
         ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
```

4 *Effects:* Calls `rdbuf()>open(s, mode | ios_base::in)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
```

5 *Effects:* Calls `open(s.c_str(), mode)`.

```
void close();
```

6 *Effects:* Calls `rdbuf()>close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

31.10.5 Class template `basic_ofstream`

[`ofstream`
[`ofstream.general`]]

31.10.5.1 General

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream : public basic_ostream<charT, traits> {
        public:
            using char_type    = charT;
            using int_type     = typename traits::int_type;
            using pos_type     = typename traits::pos_type;
            using off_type     = typename traits::off_type;
            using traits_type  = traits;
            using native_handle_type = typename basic_filebuf<charT, traits>::native_handle_type;

            // 31.10.5.2, constructors
            basic_ofstream();
            explicit basic_ofstream(const char* s,
                                    ios_base::openmode mode = ios_base::out);
            explicit basic_ofstream(const filesystem::path::value_type* s, // wide systems only; see 31.10.1
                                    ios_base::openmode mode = ios_base::out);
            explicit basic_ofstream(const string& s,
                                    ios_base::openmode mode = ios_base::out);

            template<class T>
            explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
            basic_ofstream(const basic_ofstream&) = delete;
            basic_ofstream(basic_ofstream&& rhs);

            basic_ofstream& operator=(const basic_ofstream&) = delete;
            basic_ofstream& operator=(basic_ofstream&& rhs);

            // 31.10.5.3, swap
            void swap(basic_ofstream& rhs);

            // 31.10.5.4, members
            basic_filebuf<charT, traits>*> rdbuf() const;
            native_handle_type native_handle() const noexcept;

            bool is_open() const;
            void open(const char* s, ios_base::openmode mode = ios_base::out);
            void open(const filesystem::path::value_type* s,
                     ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
            void open(const string& s, ios_base::openmode mode = ios_base::out);
            void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
            void close();

        private:
            basic_filebuf<charT, traits> sb; // exposition only
    };
}
```

```
    };
}
```

- 1 The class `basic_ofstream<charT, traits>` supports writing to named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `filebuf` object.

31.10.5.2 Constructors

[`ofstream.cons`]

```
basic_ofstream();
```

- 1 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` ([31.7.6.2.2](#)) and `sb` with `basic_filebuf<charT, traits>()` ([31.10.3.2](#)).

```
explicit basic_ofstream(const char* s,
                        ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path::value_type* s,
                        ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
```

- 2 *Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` ([31.7.6.2.2](#)) and `sb` with `basic_filebuf<charT, traits>()` ([31.10.3.2](#)), then calls `rdbuf()>open(s, mode | ios_base::out)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ofstream(const string& s,
                        ios_base::openmode mode = ios_base::out);
```

- 3 *Effects*: Equivalent to `basic_ofstream(s.c_str(), mode)`.

```
template<class T>
explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
```

- 4 *Constraints*: `is_same_v<T, filesystem::path>` is true.

- 5 *Effects*: Equivalent to `basic_ofstream(s.c_str(), mode)`.

```
basic_ofstream(basic_ofstream&& rhs);
```

- 6 *Effects*: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

31.10.5.3 Swap

[`ofstream.swap`]

```
void swap(basic_ofstream& rhs);
```

- 1 *Effects*: Exchanges the state of `*this` and `rhs` by calling `basic_ostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);
```

- 2 *Effects*: Equivalent to `x.swap(y)`.

31.10.5.4 Member functions

[`ofstream.members`]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

- 1 *Returns*: `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
native_handle_type native_handle() const noexcept;
```

- 2 *Effects*: Equivalent to: `return rdbuf()>native_handle()`;

```
bool is_open() const;
```

- 3 *Returns*: `rdbuf()>is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::out);
```

```

void open(const filesystem::path::value_type* s,
          ios_base::openmode mode = ios_base::out);           // wide systems only; see 31.10.1
4   Effects: Calls rdbuf()->open(s, mode | ios_base::out). If that function does not return a null
              pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure)
              (31.5.4.4).

void close();

5   Effects: Calls rdbuf()->close() and, if that function fails (returns a null pointer), calls setstate(
              failbit) (which may throw ios_base::failure) (31.5.4.4).

void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);

6   Effects: Calls open(s.c_str(), mode).

```

31.10.6 Class template basic_fstream

[fstream]

31.10.6.1 General

[fstream.general]

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_fstream : public basic_iostream<charT, traits> {
public:
    using char_type    = charT;
    using int_type     = typename traits::int_type;
    using pos_type     = typename traits::pos_type;
    using off_type     = typename traits::off_type;
    using traits_type  = traits;
    using native_handle_type = typename basic_filebuf<charT, traits>::native_handle_type;

    // 31.10.6.2, constructors
    basic_fstream();
    explicit basic_fstream(
        const char* s,
        ios_base::openmode mode = ios_base::in | ios_base::out);
    explicit basic_fstream(
        const filesystem::path::value_type* s,
        ios_base::openmode mode = ios_base::in|ios_base::out); // wide systems only; see 31.10.1
    explicit basic_fstream(
        const string& s,
        ios_base::openmode mode = ios_base::in | ios_base::out);
    template<class T>
    explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
    basic_fstream(const basic_fstream&) = delete;
    basic_fstream(basic_fstream&& rhs);

    basic_fstream& operator=(const basic_fstream&) = delete;
    basic_fstream& operator=(basic_fstream&& rhs);

    // 31.10.6.3, swap
    void swap(basic_fstream& rhs);

    // 31.10.6.4, members
    basic_filebuf<charT, traits>* rdbuf() const;
    native_handle_type native_handle() const noexcept;

    bool is_open() const;
    void open(
        const char* s,
        ios_base::openmode mode = ios_base::in | ios_base::out);
    void open(
        const filesystem::path::value_type* s,
        ios_base::openmode mode = ios_base::in|ios_base::out); // wide systems only; see 31.10.1

```

```

    void open(
        const string& s,
        ios_base::openmode mode = ios_base::in | ios_base::out);
    void open(
        const filesystem::path& s,
        ios_base::openmode mode = ios_base::in | ios_base::out);
    void close();

private:
    basic_filebuf<charT, traits> sb;      // exposition only
};

}

```

- ¹ The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `basic_filebuf` object.

31.10.6.2 Constructors

[`fstream.cons`]

`basic_fstream();`

- ¹ *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([31.7.5.7.2](#)) and `sb` with `basic_filebuf<charT, traits>()`.

```

explicit basic_fstream(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
explicit basic_fstream(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1

```

- ² *Effects*: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` ([31.7.5.7.2](#)) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()>open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```

explicit basic_fstream(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

```

- ³ *Effects*: Equivalent to `basic_fstream(s.c_str(), mode)`.

```

template<class T>
explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);

```

- ⁴ *Constraints*: `is_same_v<T, filesystem::path>` is true.

- ⁵ *Effects*: Equivalent to `basic_fstream(s.c_str(), mode)`.

`basic_fstream(basic_fstream&& rhs);`

- ⁶ *Effects*: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

31.10.6.3 Swap

[`fstream.swap`]

`void swap(basic_fstream& rhs);`

- ¹ *Effects*: Exchanges the state of `*this` and `rhs` by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```

template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
          basic_fstream<charT, traits>& y);

```

- ² *Effects*: Equivalent to `x.swap(y)`.

31.10.6.4 Member functions[**fstream.members**]

```

basic_filebuf<charT, traits>* rdbuf() const;
1   Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

native_handle_type native_handle() const noexcept;
2   Effects: Equivalent to: return rdbuf()->native_handle();

bool is_open() const;
3   Returns: rdbuf()->is_open().

void open(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1

4   Effects: Calls rdbuf()->open(s, mode). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
    const filesystem::path& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

5   Effects: Calls open(s.c_str(), mode).

void close();
6   Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

```

31.11 Synchronized output streams[**syncstream**]**31.11.1 Header <syncstream> synopsis**[**syncstream.syn**]

```

#include <iostream> // see 31.7.2

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
        class basic_syncbuf;

    // 31.11.2.6, specialized algorithms
    template<class charT, class traits, class Allocator>
        void swap(basic_syncbuf<charT, traits, Allocator>&,
                  basic_syncbuf<charT, traits, Allocator>&);

    using syncbuf = basic_syncbuf<char>;
    using wsyncbuf = basic_syncbuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
        class basic_osyncstream;

    using osyncstream = basic_osyncstream<char>;
    using wosyncstream = basic_osyncstream<wchar_t>;
}

```

¹ The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

31.11.2 Class template basic_syncbuf[**syncstream.syncbuf**]**31.11.2.1 Overview**[**syncstream.syncbuf.overview**]

```

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_syncbuf : public basic_streambuf<charT, traits> {
        public:
            using char_type      = charT;
            using int_type       = typename traits::int_type;
            using pos_type       = typename traits::pos_type;
            using off_type       = typename traits::off_type;
            using traits_type    = traits;
            using allocator_type = Allocator;

            using streambuf_type = basic_streambuf<charT, traits>;
```

// 31.11.2.2, construction and destruction

```

basic_syncbuf()
    : basic_syncbuf(nullptr) {}
explicit basic_syncbuf(streambuf_type* obuf)
    : basic_syncbuf(obuf, Allocator{}) {}
basic_syncbuf(streambuf_type*, const Allocator&);
basic_syncbuf(basic_syncbuf&&);
~basic_syncbuf();
```

// 31.11.2.3, assignment and swap

```

basic_syncbuf& operator=(basic_syncbuf&&);
void swap(basic_syncbuf&);
```

// 31.11.2.4, member functions

```

bool emit();
streambuf_type* get_wrapped() const noexcept;
allocator_type get_allocator() const noexcept;
void set_emit_on_sync(bool) noexcept;
```

protected:

// 31.11.2.5, overridden virtual functions

```

int sync() override;
```

private:

```

    streambuf_type* wrapped;      // exposition only
    bool emit_on_sync{};         // exposition only
};
```

}

- 1 Class template `basic_syncbuf` stores character data written to it, known as the associated output, into internal buffers allocated using the object's allocator. The associated output is transferred to the wrapped stream buffer object `*wrapped` when `emit()` is called or when the `basic_syncbuf` object is destroyed. Such transfers are atomic with respect to transfers by other `basic_syncbuf` objects with the same wrapped stream buffer object.

31.11.2.2 Construction and destruction

[syncstream.syncbuf.cons]

```
basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);
```

- 1 *Effects:* Sets `wrapped` to `obuf`.

- 2 *Postconditions:* `get_wrapped() == obuf` and `get_allocator() == allocator` are true.

- 3 *Throws:* Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.

- 4 *Remarks:* A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.

```
basic_syncbuf(basic_syncbuf&& other);
```

- 5 *Postconditions:* The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in `*this` afterwards. `other.pbase() == other.pptr()` and `other.get_wrapped() == nullptr` are true.

6 *Remarks:* This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

`~basic_syncbuf();`

7 *Effects:* Calls `emit()`.

8 *Throws:* Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

31.11.2.3 Assignment and swap

[`syncstream.syncbuf.assign`]

`basic_syncbuf& operator=(basic_syncbuf&& rhs);`

1 *Effects:* Calls `emit()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (31.11.2.2).

2 *Postconditions:*

(2.1) — `rhs.get_wrapped() == nullptr` is true.

(2.2) — `this->get_allocator() == rhs.get_allocator()` is true when
`allocator_traits<Allocator>::propagate_on_container_move_assignment::value`
is true; otherwise, the allocator is unchanged.

3 *Returns:* `*this`.

4 *Remarks:* This assignment operator disassociates `rhs` from its wrapped stream buffer, ensuring destruction of `rhs` produces no output.

`void swap(basic_syncbuf& other);`

5 *Preconditions:* Either `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `this->get_allocator() == other.get_allocator()` is true.

6 *Effects:* Exchanges the state of `*this` and `other`.

31.11.2.4 Member functions

[`syncstream.syncbuf.members`]

`bool emit();`

1 *Effects:* Atomically transfers the associated output of `*this` to the stream buffer `*wrapped`, so that it appears in the output stream as a contiguous sequence of characters. `wrapped->pubsync()` is called if and only if a call was made to `sync()` since the most recent call to `emit()`, if any.

2 *Synchronization:* All `emit()` calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the “happens before” relation (6.9.2.2), where each `emit()` call synchronizes with subsequent `emit()` calls in that total order.

3 *Postconditions:* On success, the associated output is empty.

4 *Returns:* `true` if all of the following conditions hold; otherwise `false`:

(4.1) — `wrapped == nullptr` is false.

(4.2) — All of the characters in the associated output were successfully transferred.

(4.3) — The call to `wrapped->pubsync()` (if any) succeeded.

5 *Remarks:* May call member functions of `wrapped` while holding a lock uniquely associated with `wrapped`.

`streambuf_type* get_wrapped() const noexcept;`

6 *Returns:* `wrapped`.

`allocator_type get_allocator() const noexcept;`

7 *Returns:* A copy of the allocator that was set in the constructor or assignment operator.

`void set_emit_on_sync(bool b) noexcept;`

8 *Effects:* `emit_on_sync = b`.

31.11.2.5 Overridden virtual functions

[syncstream.syncbuf.virtuals]

```
int sync() override;
```

¹ *Effects:* Records that the wrapped stream buffer is to be flushed. Then, if `emit_on_sync` is `true`, calls `emit()`.

[*Note 1:* If `emit_on_sync` is `false`, the actual flush is delayed until a call to `emit()`. — *end note*]

² *Returns:* If `emit()` was called and returned `false`, returns `-1`; otherwise `0`.

31.11.2.6 Specialized algorithms

[syncstream.syncbuf.special]

```
template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a,
          basic_syncbuf<charT, traits, Allocator>& b);
```

¹ *Effects:* Equivalent to `a.swap(b)`.

31.11.3 Class template `basic_osyncstream`

[syncstream.osyncstream]

31.11.3.1 Overview

[syncstream.osyncstream.overview]

```
namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_osyncstream : public basic_ostream<charT, traits> {
        public:
            using char_type    = charT;
            using int_type     = typename traits::int_type;
            using pos_type     = typename traits::pos_type;
            using off_type     = typename traits::off_type;
            using traits_type  = traits;

            using allocator_type = Allocator;
            using streambuf_type = basic_streambuf<charT, traits>;
            using syncbuf_type  = basic_syncbuf<charT, traits, Allocator>;

            // 31.11.3.2, construction and destruction
            basic_osyncstream(streambuf_type*, const Allocator&);
            explicit basic_osyncstream(streambuf_type* obuf)
                : basic_osyncstream(obuf, Allocator{}) {}
            basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator)
                : basic_osyncstream(os.rdbuf(), allocator) {}
            explicit basic_osyncstream(basic_ostream<charT, traits>& os)
                : basic_osyncstream(os, Allocator{}) {}
            basic_osyncstream(basic_osyncstream&&) noexcept;
            ~basic_osyncstream();

            // assignment
            basic_osyncstream& operator=(basic_osyncstream&&);

            // 31.11.3.3, member functions
            void emit();
            streambuf_type* get_wrapped() const noexcept;
            syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); }

        private:
            syncbuf_type sb;      // exposition only
        };
}
```

¹ Allocator shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).

² [Example 1: A named variable can be used within a block statement for streaming.

```
{
    osyncstream bout(cout);
    bout << "Hello, ";
    bout << "World!";
    bout << endl; // flush is noted
```

```

bout << "and more!\n";
} // characters are transferred and cout is flushed
— end example]

```

- 3 [Example 2: A temporary object can be used for streaming within a single statement.

```
osyncstream(cout) << "Hello, " << "World!" << '\n';
```

In this example, cout is not flushed. — end example]

31.11.3.2 Construction and destruction

[syncstream.osyncstream.cons]

```
basic_osyncstream(streambuf_type* buf, const Allocator& allocator);
```

- 1 *Effects:* Initializes sb from buf and allocator. Initializes the base class with basic_ostream<charT, traits>(addressof(sb)).

- 2 [Note 1: The member functions of the provided stream buffer can be called from emit() while a lock is held, which might result in a deadlock if used incautiously. — end note]

- 3 *Postconditions:* get_wrapped() == buf is true.

```
basic_osyncstream(basic_osyncstream&& other) noexcept;
```

- 4 *Effects:* Move constructs the base class and sb from the corresponding subobjects of other, and calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)).

- 5 *Postconditions:* The value returned by get_wrapped() is the value returned by other.get_wrapped() prior to calling this constructor. nullptr == other.get_wrapped() is true.

31.11.3.3 Member functions

[syncstream.osyncstream.members]

```
void emit();
```

- 1 *Effects:* Behaves as an unformatted output function (31.7.6.4). After constructing a sentry object, calls sb.emit(). If that call returns false, calls setstate(ios_base::badbit).

- 2 [Example 1: A flush on a basic_osyncstream does not flush immediately:

```

{
    osyncstream bout(cout);
    bout << "Hello," << '\n';      // no flush
    bout.emit();                    // characters transferred; cout not flushed
    bout << "World!" << endl;     // flush noted; cout not flushed
    bout.emit();                    // characters transferred; cout flushed
    bout << "Greetings." << '\n'; // no flush
} // characters transferred; cout not flushed
— end example]

```

- 3 [Example 2: The function emit() can be used to handle exceptions from operations on the underlying stream.

```

{
    osyncstream bout(cout);
    bout << "Hello, " << "World!" << '\n';
    try {
        bout.emit();
    } catch (...) {
        // handle exception
    }
}
— end example]

```

```
streambuf_type* get_wrapped() const noexcept;
```

- 4 *Returns:* sb.get_wrapped().

- 5 [Example 3: Obtaining the wrapped stream buffer with get_wrapped() allows wrapping it again with an osyncstream. For example,

```

{
    osyncstream bout1(cout);
    bout1 << "Hello, ";
}

```

```

{
    osyncstream(bout1.get_wrapped()) << "Goodbye, " << "Planet!" << '\n';
}
bout1 << "World!" << '\n';
}

```

produces the *uninterleaved* output

```

Goodbye, Planet!
Hello, World!

```

— end example]

31.12 File systems

[filesystems]

31.12.1 General

[fs.general]

- ¹ Subclause 31.12 describes operations on file systems and their components, such as paths, regular files, and directories.
- ² A *file system* is a collection of files and their attributes.
- ³ A *file* is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.
- ⁴ A *directory* is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The *parent directory* of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (31.12.6.2) in the given directory. The *parent directory* of other types of files is a directory containing a directory entry for the file under discussion.
- ⁵ A *link* is an object that associates a filename with a file. Several links can associate names with the same file. A *hard link* is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed.

[Note 1: A hard link can be thought of as a shared-ownership smart pointer to a file. — end note]

A *symbolic link* is a type of file with the property that when the file is encountered during pathname resolution (31.12.6), a string stored by the file is used to modify the pathname resolution.

[Note 2: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link. — end note]

31.12.2 Conformance

[fs.conformance]

31.12.2.1 General

[fs.conformance.general]

- ¹ Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

31.12.2.2 POSIX conformance

[fs.conform.9945]

- ¹ Some behavior is specified by reference to POSIX. How such behavior is actually implemented is unspecified.
[Note 1: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs. — end note]
- ² Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 31.12.5.

[Note 2: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. — end note]

- ³ Implementations are not required to provide behavior that is not supported by a particular file system.

[Example 1: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. — end example]

31.12.2.3 Operating system dependent behavior conformance

[fs.conform.os]

- ¹ Behavior that is specified as being *operating system dependent* is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.
- ² It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

31.12.2.4 File system race behavior

[fs.race.behavior]

- ¹ A *file system race* is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 31.12 introduce a file system race.
- ² If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, *Preconditions*: is not specified for the function.

[*Note 1*: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — *end note*]

31.12.3 Requirements

[fs.req]

- ¹ Throughout subclause 31.12, `char`, `wchar_t`, `char8_t`, `char16_t`, and `char32_t` are collectively called *encoded character types*.
- ² Functions with template parameters named `EcharT` shall not participate in overload resolution unless `EcharT` is one of the encoded character types.
- ³ Template parameters named `InputIterator` shall meet the *Cpp17InputIterator* requirements (25.3.5.3) and shall have a value type that is one of the encoded character types.
- ⁴ [*Note 1*: Use of an encoded character type implies an associated character set and encoding. Since `signed char` and `unsigned char` have no implied character set and encoding, they are not included as permitted types. — *end note*]
- ⁵ Template parameters named `Allocator` shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).

31.12.4 Header <filesystem> synopsis

[fs.filesystem.syn]

```
#include <compare> // see 17.11.1

namespace std::filesystem {
    // 31.12.6, paths
    class path;

    // 31.12.8, path non-member functions
    void swap(path& lhs, path& rhs) noexcept;
    size_t hash_value(const path& p) noexcept;

    // 31.12.7, filesystem errors
    class filesystem_error;

    // 31.12.10, directory entries
    class directory_entry;

}

```

¹ Implementations should ensure that the resolution and range of `file_time_type` reflect the operating system dependent resolution and range of file time values.

31.12.5 Error reporting

[**fs.err.report**]

- ¹ Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an `error_code`.

[*Note 1*: This supports two common use cases:

- (1.1) — Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.
- (1.2) — Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.
— *end note*]

- ² Functions not having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

- (2.1) — When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type `filesystem_error` shall be thrown. For functions with a single path argument, that argument shall be passed to the `filesystem_error` constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the `filesystem_error` constructor as the `path1` argument, and the second shall be passed as the `path2` argument. The `filesystem_error` constructor's `error_code` argument is set as appropriate for the specific operating system dependent error.
- (2.2) — Failure to allocate storage is reported by throwing an exception as described in [16.4.6.13](#).
- (2.3) — Destructors throw nothing.

- ³ Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

- (3.1) — If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

31.12.6 Class path

[**fs.class.path**]

31.12.6.1 General

[**fs.class.path.general**]

- ¹ An object of class `path` represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.

- ² [*Note 1*: Class `path` is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — *end note*]

- ³ A *path* is a sequence of elements that identify the location of a file within a filesystem. The elements are the *root-name_{opt}*, *root-directory_{opt}*, and an optional sequence of *filenames* ([31.12.6.2](#)). The maximum number of elements in the sequence is operating system dependent ([31.12.2.3](#)).

- ⁴ An *absolute path* is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A *relative path* is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent.

[*Note 2*: Pathnames “.” and “..” are relative paths. — *end note*]

- ⁵ A *pathname* is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar ([31.12.6.2](#)) or according to an operating system dependent *native pathname format* accepted by the host operating system.

- ⁶ *Pathname resolution* is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

[*Example 1*: POSIX specifies the mechanism in section 4.12, Pathname resolution. — *end example*]

```
namespace std::filesystem {
    class path {
        public:
            using value_type = see below;
            using string_type = basic_string<value_type>;
```

```

static constexpr value_type preferred_separator = see below;

friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, path& p);
};

}

```

⁷ `value_type` is a `typedef` for the operating system dependent encoded character type used to represent pathnames.

⁸ The value of the `preferred_separator` member is the operating system dependent *preferred-separator* character (31.12.6.2).

⁹ [Example 2: For POSIX-based operating systems, `value_type` is `char` and `preferred_separator` is the slash character ('/'). For Windows-based operating systems, `value_type` is `wchar_t` and `preferred_separator` is the backslash character (L'\\'). — *end example*]

31.12.6.2 Generic pathname format

[`fs.path.generic`]

```

pathname:
  root-nameopt root-directoryopt relative-path

root-name:
  operating system dependent sequences of characters
  implementation-defined sequences of characters

root-directory:
  directory-separator

relative-path:
  filename
  filename directory-separator relative-path
  an empty path

filename:
  non-empty sequence of characters other than directory-separator characters

directory-separator:
  preferred-separator directory-separatoropt
  fallback-separator directory-separatoropt

preferred-separator:
  operating system dependent directory separator character

fallback-separator:
  /, if preferred-separator is not /

```

¹ A `filename` is the name of a file. The *dot* and *dot-dot* filenames, consisting solely of one and two period characters respectively, have special meaning. The following characteristics of filenames are operating system dependent:

(1.1) — The permitted characters.

[*Example 1*: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — *end example*]

[*Note 1*: Wider portability can be achieved by limiting `filename` characters to the POSIX Portable Filename Character Set:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9 . _ - —end note]
```

- (1.2) — The maximum permitted length.
 - (1.3) — Filenames that are not permitted.
 - (1.4) — Filenames that have special meaning.
 - (1.5) — Case awareness and sensitivity during path resolution.
 - (1.6) — Special rules that may apply to file types other than regular files, such as directories.
- 2 Except in a *root-name*, multiple successive *directory-separator* characters are considered to be the same as one *directory-separator* character.
- 3 The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to *root-directory* is implementation-defined. Specific filenames may have special meanings for a particular operating system.
- 4 A *root-name* identifies the starting location for pathname resolution (31.12.6). If there are no operating system dependent *root-names*, at least one implementation-defined *root-name* is required.
- [*Note 2*: Many operating systems define a name beginning with two *directory-separator* characters as a *root-name* that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier — a *root-name* identifying a specific device such as a disk drive. — *end note*]
- 5 If a *root-name* is otherwise ambiguous, the possibility with the longest sequence of characters is chosen.
- [*Note 3*: On a POSIX-like operating system, it is impossible to have a *root-name* and a *relative-path* without an intervening *root-directory* element. — *end note*]
- 6 *Normalization* of a generic format pathname means:
1. If the path is empty, stop.
 2. Replace each slash character in the *root-name* with a *preferred-separator*.
 3. Replace each *directory-separator* with a *preferred-separator*.
- [*Note 4*: The generic pathname grammar defines *directory-separator* as one or more slashes and *preferred-separators*. — *end note*]
4. Remove each dot filename and any immediately following *directory-separator*.
 5. As long as any appear, remove a non-dot-dot filename immediately followed by a *directory-separator* and a dot-dot filename, along with any immediately following *directory-separator*.
 6. If there is a *root-directory*, remove all dot-dot filenames and any *directory-separators* immediately following them.
- [*Note 5*: These dot-dot filenames attempt to refer to nonexistent parent directories. — *end note*]
7. If the last filename is dot-dot, remove any trailing *directory-separator*.
 8. If the path is empty, add a dot.

The result of normalization is a path in *normal form*, which is said to be *normalized*.

31.12.6.3 Conversions

[**fs.path.cvt**]

31.12.6.3.1 Argument format conversions

[**fs.path.fmt.cvt**]

- 1 [*Note 1*: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:
- (1.1) — The generic format is acceptable as a native path.
 - (1.2) — There is no need to distinguish between native format and generic format in function arguments.
 - (1.3) — Paths for regular files and paths for directories share the same syntax.
- *end note*]
- 2 Several functions are defined to accept *detected-format* arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (31.12.6.2) or a pathname in the native format (31.12.6). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

- ³ [Note 2: Some operating systems have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats. — end note]
- ⁴ Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let $G(n)$ and $N(g)$ in a mathematical sense be the implementation's functions that convert native-to-generic and generic-to-native formats respectively. If $g=G(n)$ for some n , then $G(N(g))=g$; if $n=N(g)$ for some g , then $N(G(n))=n$.
- [Note 3: Neither G nor N need be invertible. — end note]
- ⁵ If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a *directory-separator*, otherwise it shall be treated as a path to a regular file.
- ⁶ [Note 4: A path stores a native format pathname (31.12.6.5.6) and acts as if it also stores a generic format pathname, related as given below. The implementation can generate the generic format pathname based on the native format pathname (and possibly other information) when requested. — end note]
- ⁷ When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function (G or N).
- ⁸ When the (new) value p of one representation of a path is derived from the representation of that or another path, a value q is chosen for the other representation. The value q converts to p (by G or N as appropriate) if any such value does so; q is otherwise unspecified.

[Note 5: If q is the result of converting any path at all, it is the result of converting p . — end note]

31.12.6.3.2 Type and encoding conversions

[fs.path.type.cvt]

- ¹ The *native encoding* of an ordinary character string is the operating system dependent current encoding for pathnames (31.12.6). The *native encoding* for wide character strings is the implementation-defined execution wide-character set encoding (16.3.3.3.4).
- ² For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from `path::value_type`. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

- (2.1) — `char`: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent.

[Note 1: For POSIX-based operating systems `path::value_type` is `char` so no conversion from `char` value type arguments or to `char` value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function. — end note]

[Note 2: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error-prone. — end note]

- (2.2) — `wchar_t`: The encoding is the native wide encoding. The method of conversion is unspecified.

[Note 3: For Windows-based operating systems `path::value_type` is `wchar_t` so no conversion from `wchar_t` value type arguments or to `wchar_t` value type return values is performed. — end note]

- (2.3) — `char8_t`: The encoding is UTF-8. The method of conversion is unspecified.

- (2.4) — `char16_t`: The encoding is UTF-16. The method of conversion is unspecified.

- (2.5) — `char32_t`: The encoding is UTF-32. The method of conversion is unspecified.

- ³ If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type `path::value_type`.

31.12.6.4 Requirements

[fs.path.req]

- ¹ In addition to the requirements (31.12.3), function template parameters named `Source` shall be one of:
- (1.1) — `basic_string<EcharT, traits, Allocator>`. A function argument `const Source& source` shall have an effective range [`source.begin()`, `source.end()`].

- (1.2) — `basic_string_view<EcharT, traits>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end()]`.
 - (1.3) — A type meeting the *Cpp17InputIterator* requirements that iterates over a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<Source>::value_type()`.
 - (1.4) — A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<decay_t<Source>>::value_type()`.
- ² Functions taking template parameters named `Source` shall not participate in overload resolution unless `Source` denotes a type other than `path`, and either
- (2.1) — `Source` is a specialization of `basic_string` or `basic_string_view`, or
 - (2.2) — the *qualified-id* `iterator_traits<decay_t<Source>>::value_type` is valid and denotes a possibly `const` encoded character type (13.10.3).
- ³ [Note 1: See path conversions (31.12.6.3) for how the value types above and their encodings convert to `path::value_type` and its encoding. — end note]
- ⁴ Arguments of type `Source` shall not be null pointers.

31.12.6.5 Members

[`fs.path.member`]

31.12.6.5.1 Constructors

[`fs.path.construct`]

`path() noexcept;`

- ¹ *Postconditions:* `empty()` is true.

`path(const path& p);`
`path(path&& p) noexcept;`

- ² *Effects:* Constructs an object of class `path` having the same pathname in the native and generic formats, respectively, as the original value of `p`. In the second form, `p` is left in a valid but unspecified state.

`path(string_type&& source, format fmt = auto_format);`

- ³ *Effects:* Constructs an object of class `path` for which the pathname in the detected-format of `source` has the original value of `source` (31.12.6.3.1), converting format if required (31.12.6.3.1). `source` is left in a valid but unspecified state.

```
template<class Source>
path(const Source& source, format fmt = auto_format);
template<class InputIterator>
path(InputIterator first, InputIterator last, format fmt = auto_format);
```

- ⁴ *Effects:* Let `s` be the effective range of `source` (31.12.6.4) or the range `[first, last)`, with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

```
template<class Source>
path(const Source& source, const locale& loc, format fmt = auto_format);
template<class InputIterator>
path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);
```

- ⁵ *Mandates:* The value type of `Source` and `InputIterator` is `char`.

- ⁶ *Effects:* Let `s` be the effective range of `source` or the range `[first, last)`, after converting the encoding as follows:

- (6.1) — If `value_type` is `wchar_t`, converts to the native wide encoding (31.12.6.3.2) using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`.
- (6.2) — Otherwise a conversion is performed using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`, and then a second conversion to the current ordinary encoding.

- 7 Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

[*Example 1*: A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

```
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX-based operating systems, the path is constructed by first using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a wide character string in the native wide encoding (31.12.6.3.2). The resulting wide string is then converted to an ordinary character pathname string in the current native ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation. — *end example*]

31.12.6.5.2 Assignments

[`fs.path.assign`]

`path& operator=(const path& p);`

- 1 *Effects*: If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`.

- 2 *Returns*: `*this`.

`path& operator=(path&& p) noexcept;`

- 3 *Effects*: If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`. `p` is left in a valid but unspecified state.

[*Note 1*: A valid implementation is `swap(p)`. — *end note*]

- 4 *Returns*: `*this`.

`path& operator=(string_type&& source);`
`path& assign(string_type&& source);`

- 5 *Effects*: Sets the pathname in the detected-format of `source` to the original value of `source`. `source` is left in a valid but unspecified state.

- 6 *Returns*: `*this`.

```
template<class Source>
path& operator=(const Source& source);
template<class Source>
path& assign(const Source& source);
template<class InputIterator>
path& assign(InputIterator first, InputIterator last);
```

- 7 *Effects*: Let `s` be the effective range of `source` (31.12.6.4) or the range [`first`, `last`), with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and sets the pathname in that format to `s`.

- 8 *Returns*: `*this`.

31.12.6.5.3 Appends

[`fs.path.append`]

- 1 The append operations use `operator/=` to denote their semantic effect of appending *preferred-separator* when needed.

`path& operator/=(const path& p);`

- 2 *Effects*: If `p.is_absolute() || (p.has_root_name() && p.root_name() != root_name())`, then `operator=(p)`.

- 3 Otherwise, modifies `*this` as if by these steps:

- (3.1) — If `p.has_root_directory()`, then removes any root directory and relative path from the generic format pathname. Otherwise, if `!has_root_directory() && is_absolute()` is true or if `has_filename()` is true, then appends `path::preferred_separator` to the generic format pathname.
- (3.2) — Then appends the native format pathname of `p`, omitting any *root-name* from its generic format pathname, to the native format pathname.
- 4 [Example 1: Even if `//host` is interpreted as a *root-name*, both of the paths `path("//host")/"foo"` and `path("//host/")/"foo"` equal `"//host/foo"` (although the former might use backslash as the preferred separator).]

Expression examples:

```
// On POSIX,
path("foo") /= path("");           // yields path("foo/")
path("foo") /= path("/bar");       // yields path("/bar")

// On Windows,
path("foo") /= path("");           // yields path("foo\\")
path("foo") /= path("/bar");       // yields path("/bar")
path("foo") /= path("c:/bar");     // yields path("c:/bar")
path("foo") /= path("c:");         // yields path("c:")
path("c:") /= path("");           // yields path("c:")
path("c:foo") /= path("/bar");    // yields path("c:/bar")
path("c:foo") /= path("c:bar");   // yields path("c:foo\\bar")
```

— end example]

- 5 Returns: `*this`.

```
template<class Source>
path& operator/=(const Source& source);
template<class Source>
path& append(const Source& source);

6 Effects: Equivalent to: return operator/=(path(source));

template<class InputIterator>
path& append(InputIterator first, InputIterator last);

7 Effects: Equivalent to: return operator/=(path(first, last));
```

31.12.6.5.4 Concatenation

[fs.path.concat]

- ```
path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
path& operator+=(const Source& x);
template<class Source>
path& concat(const Source& x);

1 Effects: Appends path(x).native() to the pathname in the native format.

[Note 1: This directly manipulates the value of native(), which is not necessarily portable between operating systems. — end note]

2 Returns: *this.

path& operator+=(value_type x);
template<class EcharT>
path& operator+=(EcharT x);

3 Effects: Equivalent to: return *this += basic_string_view(&x, 1);

template<class InputIterator>
path& concat(InputIterator first, InputIterator last);

4 Effects: Equivalent to: return *this += path(first, last);
```

### 31.12.6.5.5 Modifiers

[fs.path.modifiers]

```
void clear() noexcept;
1 Postconditions: empty() is true.
```

path& make\_preferred();

2 Effects: Each *directory-separator* of the pathname in the generic format is converted to *preferred-separator*.

3 Returns: \*this.

4 [Example 1:

```
path p("foo/bar");
std::cout << p << '\n';
p.make_preferred();
std::cout << p << '\n';
```

On an operating system where *preferred-separator* is a slash, the output is:

```
"foo/bar"
"foo/bar"
```

On an operating system where *preferred-separator* is a backslash, the output is:

```
"foo/bar"
"foo\bar"
```

— end example]

```
path& remove_filename();
```

5 Effects: Remove the generic format pathname of *filename()* from the generic format pathname.

6 Postconditions: !has\_filename().

7 Returns: \*this.

8 [Example 2:

```
path("foo/bar").remove_filename(); // yields "foo/"
path("foo/").remove_filename(); // yields "foo/"
path("/foo").remove_filename(); // yields "/"
path("//").remove_filename(); // yields "/"
```

— end example]

```
path& replace_filename(const path& replacement);
```

9 Effects: Equivalent to:

```
remove_filename();
operator/=(replacement);
```

10 Returns: \*this.

11 [Example 3:

```
path("/foo").replace_filename("bar"); // yields "/bar" on POSIX
path("//").replace_filename("bar"); // yields "/bar" on POSIX
```

— end example]

```
path& replace_extension(const path& replacement = path());
```

12 Effects:

- (12.1) — Any existing *extension()* (31.12.6.5.9) is removed from the pathname in the generic format, then
- (12.2) — If *replacement* is not empty and does not begin with a dot character, a dot character is appended to the pathname in the generic format, then
- (12.3) — *operator+=(replacement);*

13 Returns: \*this.

```
void swap(path& rhs) noexcept;
```

14 Effects: Swaps the contents (in all formats) of the two paths.

15        *Complexity:* Constant time.

### 31.12.6.5.6 Native format observers

[fs.path.native.obs]

- 1 The string returned by all native format observers is in the native pathname format (31.12.6).

const string\_type& native() const noexcept;

2        *Returns:* The pathname in the native format.

const value\_type\* c\_str() const noexcept;

3        *Effects:* Equivalent to: return native().c\_str();

operator string\_type() const;

4        *Returns:* native().

```
template<class EcharT, class traits = char_traits<EcharT>,
 class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
string(const Allocator& a = Allocator()) const;
```

5        *Returns:* native().

6        *Remarks:* All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 31.12.6.3.

```
std::string string() const;
std::wstring wstring() const;
std::u8string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;
```

7        *Returns:* native().

8        *Remarks:* Conversion, if any, is performed as specified by 31.12.6.3.

### 31.12.6.5.7 Generic format observers

[fs.path.generic.obs]

- 1 Generic format observer functions return strings formatted according to the generic pathname format (31.12.6.2). A single slash ('/') character is used as the *directory-separator*.

- 2 [Example 1: On an operating system that uses backslash as its *preferred-separator*,

```
path("foo\\bar").generic_string()
returns "foo/bar". — end example]
```

```
template<class EcharT, class traits = char_traits<EcharT>,
 class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
generic_string(const Allocator& a = Allocator()) const;
```

3        *Returns:* The pathname in the generic format.

4        *Remarks:* All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 31.12.6.3.

```
std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;
```

5        *Returns:* The pathname in the generic format.

6        *Remarks:* Conversion, if any, is specified by 31.12.6.3.

### 31.12.6.5.8 Compare

[fs.path.compare]

```
int compare(const path& p) const noexcept;
```

1        *Returns:*

- (1.1) — Let `rootNameComparison` be the result of `this->root_name().native().compare(p.root_name().native())`. If `rootNameComparison` is not 0, `rootNameComparison`.
- (1.2) — Otherwise, if `!this->has_root_directory()` and `p.has_root_directory()`, a value less than 0.
- (1.3) — Otherwise, if `this->has_root_directory()` and `!p.has_root_directory()`, a value greater than 0.
- (1.4) — Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically less than `native()` for the elements of `p.relative_path()`, a value less than 0.
- (1.5) — Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically greater than `native()` for the elements of `p.relative_path()`, a value greater than 0.
- (1.6) — Otherwise, 0.

```
int compare(const string_type& s) const;
int compare(basic_string_view<value_type> s) const;
int compare(const value_type* s) const;
```

2     *Effects:* Equivalent to: `return compare(path(s));`

### 31.12.6.5.9 Decomposition

[`fs.path.decompose`]

`path root_name() const;`

1     *Returns:* `root-name`, if the pathname in the generic format includes `root-name`, otherwise `path()`.

`path root_directory() const;`

2     *Returns:* `root-directory`, if the pathname in the generic format includes `root-directory`, otherwise `path()`.

`path root_path() const;`

3     *Returns:* `root_name() / root_directory()`.

`path relative_path() const;`

4     *Returns:* A path composed from the pathname in the generic format, if `empty()` is `false`, beginning with the first `filename` after `root_path()`. Otherwise, `path()`.

`path parent_path() const;`

5     *Returns:* `*this` if `has_relative_path()` is `false`, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of `*this` that produces one fewer element in its iteration.

`path filename() const;`

6     *Returns:* `relative_path().empty() ? path() : *--end()`.

7     *[Example 1:*

```
path("/foo/bar.txt").filename(); // yields "bar.txt"
path("/foo/bar").filename(); // yields "bar"
path("/foo/bar/").filename(); // yields ""
path("//").filename(); // yields ""
path("//host").filename(); // yields ""
path(".").filename(); // yields "."
path("../").filename(); // yields ".."
```

*— end example]*

`path stem() const;`

8     *Returns:* Let `f` be the generic format pathname of `filename()`. Returns a path whose pathname in the generic format is

- (8.1) — `f`, if it contains no periods other than a leading period or consists solely of one or two periods;
- (8.2) — otherwise, the prefix of `f` ending before its last period.

9        [Example 2:  
     std::cout << path("/foo/bar.txt").stem();                    // outputs "bar"  
     path p = "foo.bar.baz.tar";  
     for (; !p.extension().empty(); p = p.stem())  
         std::cout << p.extension() << '\n';  
         // outputs: .tar  
         // .baz  
         // .bar  
     — end example]

path extension() const;

10      Returns: A path whose pathname in the generic format is the suffix of `filename()` not included in `stem()`.

11      [Example 3:  
     path("/foo/bar.txt").extension();                            // yields ".txt" and `stem()` is "bar"  
     path("/foo/bar").extension();                                // yields "" and `stem()` is "bar"  
     path("/foo/.profile").extension();                        // yields "" and `stem()` is ".profile"  
     path(".bar").extension();                                    // yields "" and `stem()` is ".bar"  
     path("../bar").extension();                                // yields ".bar" and `stem()` is "."  
     — end example]

12      [Note 1: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension. — end note]

13      [Note 2: On non-POSIX operating systems, for a path `p`, it is possible that `p.stem() + p.extension() == p.filename()` is `false`, even though the generic format pathnames are the same. — end note]

### 31.12.6.5.10 Query

[fs.path.query]

[[nodiscard]] bool empty() const noexcept;

1        Returns: `true` if the pathname in the generic format is empty, otherwise `false`.

bool has\_root\_path() const;

2        Returns: `!root_path().empty()`.

bool has\_root\_name() const;

3        Returns: `!root_name().empty()`.

bool has\_root\_directory() const;

4        Returns: `!root_directory().empty()`.

bool has\_relative\_path() const;

5        Returns: `!relative_path().empty()`.

bool has\_parent\_path() const;

6        Returns: `!parent_path().empty()`.

bool has\_filename() const;

7        Returns: `!filename().empty()`.

bool has\_stem() const;

8        Returns: `!stem().empty()`.

bool has\_extension() const;

9        Returns: `!extension().empty()`.

bool is\_absolute() const;

10      Returns: `true` if the pathname in the native format contains an absolute path ([31.12.6](#)), otherwise `false`.

11 [Example 1: `path("/")`.`is_absolute()` is `true` for POSIX-based operating systems, and `false` for Windows-based operating systems. —end example]

12    `bool is_relative() const;`  
     >Returns: `!is_absolute()`.

### 31.12.6.5.11 Generation

[`fs.path.gen`]

`path lexically_normal() const;`

1    >Returns: A path whose pathname in the generic format is the normal form (31.12.6.2) of the pathname in the generic format of `*this`.

2 [Example 1:

```
assert(path("foo./bar...").lexically_normal() == "foo/");
assert(path("foo///bar...").lexically_normal() == "foo/");
```

The above assertions will succeed. On Windows, the returned path's *directory-separator* characters will be backslashes rather than slashes, but that does not affect `path` equality. —end example]

`path lexically_relative(const path& base) const;`

3 Effects: If:

- (3.1) — `root_name() != base.root_name()` is true, or
- (3.2) — `is_absolute() != base.is_absolute()` is true, or
- (3.3) — `!has_root_directory() && base.has_root_directory()` is true, or
- (3.4) — any `filename` in `relative_path()` or `base.relative_path()` can be interpreted as a *root-name*, returns `path()`.

[Note 1: On a POSIX implementation, no `filename` in a *relative-path* is acceptable as a *root-name*. —end note]

Determines the first mismatched element of `*this` and `base` as if by:

```
auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());
```

Then,

- (3.5) — if `a == end()` and `b == base.end()`, returns `path(".")`; otherwise
- (3.6) — let `n` be the number of `filename` elements in `[b, base.end()]` that are not dot or dot-dot or empty, minus the number that are dot-dot. If `n<0`, returns `path()`; otherwise
- (3.7) — if `n == 0` and (`a == end()` || `a->empty()`), returns `path(".")`; otherwise
- (3.8) — returns an object of class `path` that is default-constructed, followed by
  - application of `operator/=(path("...")) n` times, and then
  - application of `operator/=` for each element in `[a, end()]`.

4 Returns: `*this` made relative to `base`. Does not resolve (31.12.6) symlinks. Does not first normalize (31.12.6.2) `*this` or `base`.

5 [Example 2:

```
assert(path("/a/d").lexically_relative("/a/b/c") == ".../d");
assert(path("/a/b/c").lexically_relative("/a/d") == ".../b/c");
assert(path("a/b/c").lexically_relative("a") == "b/c");
assert(path("a/b/c").lexically_relative("a/b/c/x/y") == ".../x/y");
assert(path("a/b/c").lexically_relative("a/b/c") == ".");
assert(path("a/b").lexically_relative("c/d") == ".../a/b");
```

The above assertions will succeed. On Windows, the returned path's *directory-separator* characters will be backslashes rather than slashes, but that does not affect `path` equality. —end example]

6 [Note 2: If symlink following semantics are desired, use the operational function `relative()`. —end note]

7 [Note 3: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply `lexically_normal()` to `*this`, `base`, or both. —end note]

```
path lexically_proximate(const path& base) const;
```

8     >Returns: If the value of `lexically_relative(base)` is not an empty path, return it. Otherwise return `*this`.

9     [*Note 4*: If symlink following semantics are desired, use the operational function `proximate()`. — *end note*]

10    [*Note 5*: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply `lexically_normal()` to `*this`, `base`, or both. — *end note*]

### 31.12.6.6 Iterators

[fs.path.itr]

- 1 Path iterators iterate over the elements of the pathname in the generic format (31.12.6.2).
- 2 A `path::iterator` is a constant iterator meeting all the requirements of a bidirectional iterator (25.3.5.6) except that, for dereferenceable iterators `a` and `b` of type `path::iterator` with `a == b`, there is no requirement that `*a` and `*b` are bound to the same object. Its `value_type` is `path`.
- 3 Calling any non-const member function of a `path` object invalidates all iterators referring to elements of that object.
- 4 For the elements of the pathname in the generic format, the forward traversal order is as follows:
  - (4.1) — The *root-name* element, if present.
  - (4.2) — The *root-directory* element, if present.  
[*Note 1*: The generic format is required to ensure lexicographical comparison works correctly. — *end note*]
  - (4.3) — Each successive *filename* element, if present.
  - (4.4) — An empty element, if a trailing non-root *directory-separator* is present.
- 5 The backward traversal order is the reverse of forward traversal.

```
iterator begin() const;
```

- 6     >Returns: An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.

```
iterator end() const;
```

- 7     >Returns: The end iterator.

### 31.12.6.7 Inserter and extractor

[fs.path.io]

```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const path& p);
```

1     >*Effects*: Equivalent to `os << quoted(p.string<charT, traits>())`.

[*Note 1*: The `quoted` function is described in 31.7.9. — *end note*]

2     >Returns: `os`.

```
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, path& p);
```

3     >*Effects*: Equivalent to:  
`basic_string<charT, traits> tmp;`  
`is >> quoted(tmp);`  
`p = tmp;`

- 4     >Returns: `is`.

### 31.12.6.8 Non-member functions

[fs.path.nonmember]

```
void swap(path& lhs, path& rhs) noexcept;
```

1     >*Effects*: Equivalent to `lhs.swap(rhs)`.

```
size_t hash_value(const path& p) noexcept;
```

- 2     >Returns: A hash value for the path `p`. If for two paths, `p1 == p2` then `hash_value(p1) == hash_value(p2)`.

```

friend bool operator==(const path& lhs, const path& rhs) noexcept;
3 Returns: lhs.compare(rhs) == 0.
4 [Note 1: Path equality and path equivalence have different semantics.
(4.1) — Equality is determined by the path non-member operator==, which considers the two paths' lexical
 representations only.
 [Example 1: path("foo") == "bar" is never true. —end example]
(4.2) — Equivalence is determined by the equivalent() non-member function, which determines if two paths
 resolve (31.12.6) to the same file system entity.
 [Example 2: equivalent("foo", "bar") will be true when both paths resolve to the same file. —end
 example]
 — end note]

friend strong_ordering operator<=>(const path& lhs, const path& rhs) noexcept;
5 Returns: lhs.compare(rhs) <=> 0.

friend path operator/(const path& lhs, const path& rhs);
6 Effects: Equivalent to: return path(lhs) /= rhs;

```

### 31.12.6.9 Hash support [fs.path.hash]

```
template<> struct hash<filesystem::path>;
```

- 1 For an object p of type filesystem::path, hash<filesystem::path>()(p) evaluates to the same result as filesystem::hash\_value(p).

### 31.12.7 Class filesystem\_error [fs.class.filesystem.error]

#### 31.12.7.1 General [fs.class.filesystem.error.general]

```

namespace std::filesystem {
 class filesystem_error : public system_error {
public:
 filesystem_error(const string& what_arg, error_code ec);
 filesystem_error(const string& what_arg,
 const path& p1, error_code ec);
 filesystem_error(const string& what_arg,
 const path& p1, const path& p2, error_code ec);

 const path& path1() const noexcept;
 const path& path2() const noexcept;
 const char* what() const noexcept override;
};

}

```

- 1 The class filesystem\_error defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 31.12.

#### 31.12.7.2 Members [fs.filesystem.error.members]

- 1 Constructors are provided that store zero, one, or two paths associated with an error.

```
filesystem_error(const string& what_arg, error_code ec);
```

- 2 Postconditions:

- (2.1) — code() == ec is true,
- (2.2) — path1().empty() is true,
- (2.3) — path2().empty() is true, and
- (2.4) — string\_view(what()).find(what\_arg.c\_str()) != string\_view::npos is true.

```
filesystem_error(const string& what_arg, const path& p1, error_code ec);
```

- 3 Postconditions:

- (3.1) — code() == ec is true,

```

(3.2) — path1() returns a reference to the stored copy of p1,
(3.3) — path2().empty() is true, and
(3.4) — string_view(what()).find(what_arg.c_str()) != string_view::npos is true.
filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);

4 Postconditions:
(4.1) — code() == ec,
(4.2) — path1() returns a reference to the stored copy of p1,
(4.3) — path2() returns a reference to the stored copy of p2, and
(4.4) — string_view(what()).find(what_arg.c_str()) != string_view::npos.
```

`const path& path1() const noexcept;`

5 *Returns:* A reference to the copy of `p1` stored by the constructor, or, if none, an empty path.

`const path& path2() const noexcept;`

6 *Returns:* A reference to the copy of `p2` stored by the constructor, or, if none, an empty path.

`const char* what() const noexcept override;`

7 *Returns:* An NTBS that incorporates the `what_arg` argument supplied to the constructor. The exact format is unspecified. Implementations should include the `system_error::what()` string and the pathnames of `path1` and `path2` in the native format in the returned string.

### 31.12.8 Enumerations

[fs.enum]

#### 31.12.8.1 Enum path::format

[fs.enum.path.format]

- <sup>1</sup> This enum specifies constants used to identify the format of the character sequence, with the meanings listed in [Table 130](#).

**Table 130 — Enum path::format** [tab:fs.enum.path.format]

| Name                        | Meaning                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>native_format</code>  | The native pathname format.                                                                                                                                                                                                                                                                                                                                     |
| <code>generic_format</code> | The generic pathname format.                                                                                                                                                                                                                                                                                                                                    |
| <code>auto_format</code>    | The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format.<br><i>Recommended practice:</i> For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way. |

#### 31.12.8.2 Enum class file\_type

[fs.enum.file.type]

- <sup>1</sup> This enum class specifies constants used to identify file types, with the meanings listed in [Table 131](#). The values of the constants are distinct.

#### 31.12.8.3 Enum class copy\_options

[fs.enum.copy.opts]

- <sup>1</sup> The enum class type `copy_options` is a bitmask type ([16.3.3.3.3](#)) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in [Table 132](#). The constant `none` represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.

#### 31.12.8.4 Enum class perms

[fs.enum.perms]

- <sup>1</sup> The enum class type `perms` is a bitmask type ([16.3.3.3.3](#)) that specifies bitmask constants used to identify file permissions, with the meanings listed in [Table 133](#).

**Table 131 — Enum class file\_type [tab:fs.enum.file.type]**

| Constant               | Meaning                                                                                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| none                   | The type of the file has not been determined or an error occurred while trying to determine the type.                                                                                                                   |
| not_found              | Pseudo-type indicating the file was not found.<br>[Note 1: The file not being found is not considered an error while determining the type of a file. — end note]                                                        |
| regular                | Regular file                                                                                                                                                                                                            |
| directory              | Directory file                                                                                                                                                                                                          |
| symlink                | Symbolic link file                                                                                                                                                                                                      |
| block                  | Block special file                                                                                                                                                                                                      |
| character              | Character special file                                                                                                                                                                                                  |
| fifo                   | FIFO or pipe file                                                                                                                                                                                                       |
| socket                 | Socket file                                                                                                                                                                                                             |
| implementation-defined | Implementations that support file systems having file types in addition to the above file_type types shall supply implementation-defined file_type constants to separately identify each of those additional file types |
| unknown                | The file exists but the type cannot be determined                                                                                                                                                                       |

**Table 132 — Enum class copy\_options [tab:fs.enum.copy.opts]**

| Option group controlling copy_file function effects for existing target files   |                                                                                                                                                    |
|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Constant                                                                        | Meaning                                                                                                                                            |
| none                                                                            | (Default) Error; file already exists.                                                                                                              |
| skip_existing                                                                   | Do not overwrite existing file, do not report an error.                                                                                            |
| overwrite_existing                                                              | Overwrite the existing file.                                                                                                                       |
| update_existing                                                                 | Overwrite the existing file if it is older than the replacement file.                                                                              |
| Option group controlling copy function effects for subdirectories               |                                                                                                                                                    |
| Constant                                                                        | Meaning                                                                                                                                            |
| none                                                                            | (Default) Do not copy subdirectories.                                                                                                              |
| recursive                                                                       | Recursively copy subdirectories and their contents.                                                                                                |
| Option group controlling copy function effects for symbolic links               |                                                                                                                                                    |
| Constant                                                                        | Meaning                                                                                                                                            |
| none                                                                            | (Default) Follow symbolic links.                                                                                                                   |
| copy_symlinks                                                                   | Copy symbolic links as symbolic links rather than copying the files that they point to.                                                            |
| skip_symlinks                                                                   | Ignore symbolic links.                                                                                                                             |
| Option group controlling copy function effects for choosing the form of copying |                                                                                                                                                    |
| Constant                                                                        | Meaning                                                                                                                                            |
| none                                                                            | (Default) Copy content.                                                                                                                            |
| directories_only                                                                | Copy directory structure only, do not copy non-directory files.                                                                                    |
| create_symlinks                                                                 | Make symbolic links instead of copies of files. The source path shall be an absolute path unless the destination path is in the current directory. |
| create_hard_links                                                               | Make hard links instead of copies of files.                                                                                                        |

**Table 133 — Enum class perms [tab:fs.enum.perms]**

| Name         | Value<br>(octal) | POSIX<br>macro | Definition or notes                                                                                                         |
|--------------|------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------|
| none         | 0                |                | There are no permissions set for the file.                                                                                  |

| unknown      | 0xFFFFF          |                | The permissions are not known, such as when a <code>file_status</code> object is created without specifying the permissions |

**31.12.8.5 Enum class perm\_options**

[fs.enum.perm.opts]

- <sup>1</sup> The enum class type `perm_options` is a bitmask type (16.3.3.3) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 134. The bitmask constants are bitmask elements. In Table 134 `perm` denotes a value of type `perms` passed to `permissions`.

**Table 134 — Enum class perm\_options [tab:fs.enum.perm.opts]**

| Name     | Meaning                                                                                                                                                               |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replace  | <code>permissions</code> shall replace the file's permission bits with <code>perm</code>                                                                              |
| add      | <code>permissions</code> shall replace the file's permission bits with the bitwise OR of <code>perm</code> and the file's current permission bits.                    |
| remove   | <code>permissions</code> shall replace the file's permission bits with the bitwise AND of the complement of <code>perm</code> and the file's current permission bits. |
| nofollow | <code>permissions</code> shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.                         |

**31.12.8.6 Enum class directory\_options**

[fs.enum.dir.opts]

- <sup>1</sup> The enum class type `directory_options` is a bitmask type (16.3.3.3) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 135. The constant `none` represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

**31.12.9 Class file\_status**

[fs.class.file.status]

**31.12.9.1 General**

[fs.class.file.status.general]

**Table 135 — Enum class directory\_options [tab:fs.enum.dir.opts]**

| Name                     | Meaning                                                            |
|--------------------------|--------------------------------------------------------------------|
| none                     | (Default) Skip directory symlinks, permission denied is an error.  |
| follow_directory_symlink | Follow rather than skip directory symlinks.                        |
| skip_permission_denied   | Skip directories that would otherwise result in permission denied. |

```

namespace std::filesystem {
 class file_status {
 public:
 // 31.12.9.2, constructors and destructor
 file_status() noexcept : file_status(file_type::none) {}
 explicit file_status(file_type ft,
 perms prms = perms::unknown) noexcept;
 file_status(const file_status&) noexcept = default;
 file_status(file_status&&) noexcept = default;
 ~file_status();

 // assignments
 file_status& operator=(const file_status&) noexcept = default;
 file_status& operator=(file_status&&) noexcept = default;

 // 31.12.9.4, modifiers
 void type(file_type ft) noexcept;
 void permissions(perms prms) noexcept;

 // 31.12.9.3, observers
 file_type type() const noexcept;
 perms permissions() const noexcept;

 friend bool operator==(const file_status& lhs, const file_status& rhs) noexcept
 { return lhs.type() == rhs.type() && lhs.permissions() == rhs.permissions(); }
 };
}

```

<sup>1</sup> An object of type `file_status` stores information about the type and permissions of a file.

### 31.12.9.2 Constructors

[fs.file.status.cons]

```
explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
```

<sup>1</sup> *Postconditions:* `type() == ft` and `permissions() == prms`.

### 31.12.9.3 Observers

[fs.file.status.obs]

```
file_type type() const noexcept;
```

<sup>1</sup> *Returns:* The value of `type()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `type(file_type)` function.

```
perms permissions() const noexcept;
```

<sup>2</sup> *Returns:* The value of `permissions()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `permissions(perms)` function.

### 31.12.9.4 Modifiers

[fs.file.status.mods]

```
void type(file_type ft) noexcept;
```

<sup>1</sup> *Postconditions:* `type() == ft`.

```
void permissions(perms prms) noexcept;
```

<sup>2</sup> *Postconditions:* `permissions() == prms`.

**31.12.10 Class directory\_entry** [fs.class.directory.entry]

**31.12.10.1 General** [fs.class.directory.entry.general]

```

namespace std::filesystem {
 class directory_entry {
 public:
 // 31.12.10.2, constructors and destructor
 directory_entry() noexcept = default;
 directory_entry(const directory_entry&) = default;
 directory_entry(directory_entry&&) noexcept = default;
 explicit directory_entry(const filesystem::path& p);
 directory_entry(const filesystem::path& p, error_code& ec);
 ~directory_entry();

 // assignments
 directory_entry& operator=(const directory_entry&) = default;
 directory_entry& operator=(directory_entry&&) noexcept = default;

 // 31.12.10.3, modifiers
 void assign(const filesystem::path& p);
 void assign(const filesystem::path& p, error_code& ec);
 void replace_filename(const filesystem::path& p);
 void replace_filename(const filesystem::path& p, error_code& ec);
 void refresh();
 void refresh(error_code& ec) noexcept;

 // 31.12.10.4, observers
 const filesystem::path& path() const noexcept;
 operator const filesystem::path&() const noexcept;
 bool exists() const;
 bool exists(error_code& ec) const noexcept;
 bool is_block_file() const;
 bool is_block_file(error_code& ec) const noexcept;
 bool is_character_file() const;
 bool is_character_file(error_code& ec) const noexcept;
 bool is_directory() const;
 bool is_directory(error_code& ec) const noexcept;
 bool is_fifo() const;
 bool is_fifo(error_code& ec) const noexcept;
 bool is_other() const;
 bool is_other(error_code& ec) const noexcept;
 bool is_regular_file() const;
 bool is_regular_file(error_code& ec) const noexcept;
 bool is_socket() const;
 bool is_socket(error_code& ec) const noexcept;
 bool is_symlink() const;
 bool is_symlink(error_code& ec) const noexcept;
 uintmax_t file_size() const;
 uintmax_t file_size(error_code& ec) const noexcept;
 uintmax_t hard_link_count() const;
 uintmax_t hard_link_count(error_code& ec) const noexcept;
 file_time_type last_write_time() const;
 file_time_type last_write_time(error_code& ec) const noexcept;
 file_status status() const;
 file_status status(error_code& ec) const noexcept;
 file_status symlink_status() const;
 file_status symlink_status(error_code& ec) const noexcept;

 bool operator==(const directory_entry& rhs) const noexcept;
 strong_ordering operator<=>(const directory_entry& rhs) const noexcept;

 // 31.12.10.5, inserter
 template<class charT, class traits>
 friend basic_ostream<charT, traits>&
```

```

operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);

private:
 filesystem::path pathobject; // exposition only
 friend class directory_iterator; // exposition only
};

}

}

```

- <sup>1</sup> A `directory_entry` object stores a `path` object and may store additional objects for file attributes such as hard link count, status, symlink status, file size, and last write time.
- <sup>2</sup> Implementations should store such additional file attributes during directory iteration if their values are available and storing the values would allow the implementation to eliminate file system accesses by `directory_entry` observer functions ([31.12.13](#)). Such stored file attribute values are said to be *cached*.
- <sup>3</sup> [Note 1: For purposes of exposition, class `directory_iterator` ([31.12.11](#)) is shown above as a friend of class `directory_entry`. Friendship allows the `directory_iterator` implementation to cache already available attribute values directly into a `directory_entry` object without the cost of an unneeded call to `refresh()`. —end note]
- <sup>4</sup> [Example 1:

```

using namespace std::filesystem;

// use possibly cached last write time to minimize disk accesses
for (auto&& x : directory_iterator("."))

{
 std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto&& x : directory_iterator("."))

{
 lengthy_function(x.path()); // cache becomes stale
 x.refresh();
 std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

```

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the `std::filesystem::last_write_time` function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the `std::filesystem::last_write_time` function. The code is portable to any implementation, regardless of whether or not it employs caching. —end example]

### 31.12.10.2 Constructors

[fs.dir.entry.cons]

```
explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);
```

- <sup>1</sup> Effects: Calls `refresh()` or `refresh(ec)`, respectively.
- <sup>2</sup> Postconditions: `path() == p` if no error occurs, otherwise `path() == filesystem::path()`.
- <sup>3</sup> Throws: As specified in [31.12.5](#).

### 31.12.10.3 Modifiers

[fs.dir.entry.mods]

```
void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);
```

- <sup>1</sup> Effects: Equivalent to `pathobject = p`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.
- <sup>2</sup> Throws: As specified in [31.12.5](#).

```
void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);
```

- <sup>3</sup> Effects: Equivalent to `pathobject.replace_filename(p)`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.
- <sup>4</sup> Throws: As specified in [31.12.5](#).

```
void refresh();
void refresh(error_code& ec) noexcept;
```

5     *Effects:* Stores the current values of any cached attributes of the file *p* resolves to. If an error occurs, an error is reported (31.12.5) and the values of any cached attributes are unspecified.

6     *Throws:* As specified in 31.12.5.

7     *[Note 1: Implementations of directory\_iterator (31.12.11) are prohibited from directly or indirectly calling the refresh function as described in 31.12.11. — end note]*

### 31.12.10.4 Observers

[fs.dir.entry.obs]

1 Unqualified function names in the *Returns:* elements of the directory\_entry observers described below refer to members of the std::filesystem namespace.

```
const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;
```

2     *Returns:* pathobject.

```
bool exists() const;
bool exists(error_code& ec) const noexcept;
```

3     *Returns:* exists(this->status()) or exists(this->status(ec)), respectively.

4     *Throws:* As specified in 31.12.5.

```
bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
```

5     *Returns:* is\_block\_file(this->status()) or is\_block\_file(this->status(ec)), respectively.

6     *Throws:* As specified in 31.12.5.

```
bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;
```

7     *Returns:* is\_character\_file(this->status()) or is\_character\_file(this->status(ec)), respectively.

8     *Throws:* As specified in 31.12.5.

```
bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;
```

9     *Returns:* is\_directory(this->status()) or is\_directory(this->status(ec)), respectively.

10    *Throws:* As specified in 31.12.5.

```
bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;
```

11    *Returns:* is\_fifo(this->status()) or is\_fifo(this->status(ec)), respectively.

12    *Throws:* As specified in 31.12.5.

```
bool is_other() const;
bool is_other(error_code& ec) const noexcept;
```

13    *Returns:* is\_other(this->status()) or is\_other(this->status(ec)), respectively.

14    *Throws:* As specified in 31.12.5.

```
bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;
```

15    *Returns:* is\_regular\_file(this->status()) or is\_regular\_file(this->status(ec)), respectively.

16    *Throws:* As specified in 31.12.5.

```
bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
```

17    *Returns:* is\_socket(this->status()) or is\_socket(this->status(ec)), respectively.

18        *Throws:* As specified in [31.12.5](#).

```
bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
```

19        *Returns:* `is_symlink(this->symlink_status())` or `is_symlink(this->symlink_status(ec))`, respectively.

20        *Throws:* As specified in [31.12.5](#).

```
uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
```

21        *Returns:* If cached, the file size attribute value. Otherwise, `file_size(path())` or `file_size(path(), ec)`, respectively.

22        *Throws:* As specified in [31.12.5](#).

```
uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
```

23        *Returns:* If cached, the hard link count attribute value. Otherwise, `hard_link_count(path())` or `hard_link_count(path(), ec)`, respectively.

24        *Throws:* As specified in [31.12.5](#).

```
file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
```

25        *Returns:* If cached, the last write time attribute value. Otherwise, `last_write_time(path())` or `last_write_time(path(), ec)`, respectively.

26        *Throws:* As specified in [31.12.5](#).

```
file_status status() const;
file_status status(error_code& ec) const noexcept;
```

27        *Returns:* If cached, the status attribute value. Otherwise, `status(path())` or `status(path(), ec)`, respectively.

28        *Throws:* As specified in [31.12.5](#).

```
file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;
```

29        *Returns:* If cached, the symlink status attribute value. Otherwise, `symlink_status(path())` or `symlink_status(path(), ec)`, respectively.

30        *Throws:* As specified in [31.12.5](#).

```
bool operator==(const directory_entry& rhs) const noexcept;
```

31        *Returns:* `pathobject == rhs.pathobject`.

```
strong_ordering operator<=(const directory_entry& rhs) const noexcept;
```

32        *Returns:* `pathobject <= rhs.pathobject`.

### 31.12.10.5 Inserter

[fs.dir.entry.io]

```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);
```

1        *Effects:* Equivalent to: `return os << d.path();`

### 31.12.11 Class `directory_iterator`

[fs.class.directory.iterator]

#### 31.12.11.1 General

[fs.class.directory.iterator.general]

1 An object of type `directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the path and any cached attribute values ([31.12.10](#)) for each file in a directory or in an implementation-defined directory-like file type.

[*Note 1:* For iteration into subdirectories, see class `recursive_directory_iterator` ([31.12.12](#)). — *end note*]

```

namespace std::filesystem {
 class directory_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = directory_entry;
 using difference_type = ptrdiff_t;
 using pointer = const directory_entry*;
 using reference = const directory_entry&;
 using iterator_category = input_iterator_tag;
 using value_type = directory_entry;
 using difference_type = ptrdiff_t;
 using pointer = const directory_entry*;
 using reference = const directory_entry&;

 // 31.12.11.2, member functions
 directory_iterator() noexcept;
 explicit directory_iterator(const path& p);
 directory_iterator(const path& p, directory_options options);
 directory_iterator(const path& p, error_code& ec);
 directory_iterator(const path& p, directory_options options,
 error_code& ec);
 directory_iterator(const directory_iterator& rhs);
 directory_iterator(directory_iterator&& rhs) noexcept;
 ~directory_iterator();

 directory_iterator& operator=(const directory_iterator& rhs);
 directory_iterator& operator=(directory_iterator&& rhs) noexcept;

 const directory_entry& operator*() const;
 const directory_entry* operator->() const;
 directory_iterator& operator++();
 directory_iterator& increment(error_code& ec);

 bool operator==(default_sentinel_t) const noexcept {
 return *this == directory_iterator();
 }

 // other members as required by 25.3.5.3, input iterators
 };
}

```

- <sup>2</sup> `directory_iterator` meets the `Cpp17InputIterator` requirements ([25.3.5.3](#)).
  - <sup>3</sup> If an iterator of type `directory_iterator` reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The `directory_iterator` default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.
  - <sup>4</sup> The end iterator is not dereferenceable.
  - <sup>5</sup> Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.
  - <sup>6</sup> The result of calling the `path()` member of the `directory_entry` object obtained by dereferencing a `directory_iterator` is a reference to a `path` object composed of the `directory` argument from which the iterator was constructed with the filename of the directory entry appended as if by `operator/`.
  - <sup>7</sup> Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.
  - <sup>8</sup> The order of directory entries obtained by dereferencing successive increments of a `directory_iterator` is unspecified.
  - <sup>9</sup> Constructors and non-const `directory_iterator` member functions store the values of any cached attributes ([31.12.10](#)) in the `directory_entry` element returned by `operator*()`. `directory_iterator` member functions shall not directly or indirectly call any `directory_entry refresh` function.
- [*Note 2:* The exact mechanism for storing cached attribute values is not exposed to users. For exposition, class `directory_iterator` is shown in [31.12.10](#) as a friend of class `directory_entry`. — *end note*]
- <sup>10</sup> [*Note 3:* A path obtained by dereferencing a directory iterator might not actually exist; it could be a symbolic link to a non-existent file. Recursively walking directory trees for purposes of removing and renaming entries might invalidate symbolic links that are being followed. — *end note*]

<sup>11</sup> [Note 4: If a file is removed from or added to a directory after the construction of a `directory_iterator` for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX `readdir`. —end note]

### 31.12.11.2 Members

[fs.dir.itr.members]

```
directory_iterator() noexcept;
```

<sup>1</sup> *Effects:* Constructs the end iterator.

```
explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);
```

<sup>2</sup> *Effects:* For the directory that `p` resolves to, constructs an iterator for the first element in a sequence of `directory_entry` elements representing the files in the directory, if any; otherwise the end iterator. However, if

```
(options & directory_options::skip_permission_denied) != directory_options::none
```

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

<sup>3</sup> *Throws:* As specified in 31.12.5.

<sup>4</sup> [Note 1: To iterate over the current directory, use `directory_iterator(".")` rather than `directory_iterator("")`. —end note]

```
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
```

<sup>5</sup> *Postconditions:* `*this` has the original value of `rhs`.

```
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;
```

<sup>6</sup> *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

<sup>7</sup> *Postconditions:* `*this` has the original value of `rhs`.

<sup>8</sup> *Returns:* `*this`.

```
directory_iterator& operator++();
directory_iterator& increment(error_code& ec);
```

<sup>9</sup> *Effects:* As specified for the prefix increment operation of Input iterators (25.3.5.3).

<sup>10</sup> *Returns:* `*this`.

<sup>11</sup> *Throws:* As specified in 31.12.5.

### 31.12.11.3 Non-member functions

[fs.dir.itr.nonmembers]

<sup>1</sup> These functions enable range access for `directory_iterator`.

```
directory_iterator begin(directory_iterator iter) noexcept;
```

<sup>2</sup> *Returns:* `iter`.

```
directory_iterator end(directory_iterator) noexcept;
```

<sup>3</sup> *Returns:* `directory_iterator()`.

### 31.12.12 Class recursive\_directory\_iterator

[fs.class.rec.dir.itr]

#### 31.12.12.1 General

[fs.class.rec.dir.itr.general]

<sup>1</sup> An object of type `recursive_directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the files in a directory or in an implementation-defined directory-like file type, and its subdirectories.

```
namespace std::filesystem {
 class recursive_directory_iterator {
 public:
 using iterator_category = input_iterator_tag;
```

```

using value_type = directory_entry;
using difference_type = ptrdiff_t;
using pointer = const directory_entry*;
using reference = const directory_entry&;

// 31.12.12.2, constructors and destructor
recursive_directory_iterator() noexcept;
explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options,
 error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);
recursive_directory_iterator(const recursive_directory_iterator& rhs);
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
~recursive_directory_iterator();

// 31.12.12.2, observers
directory_options options() const;
int depth() const;
bool recursion_pending() const;

const directory_entry& operator*() const;
const directory_entry* operator->() const;

// 31.12.12.2, modifiers
recursive_directory_iterator&
operator=(const recursive_directory_iterator& rhs);
recursive_directory_iterator&
operator=(recursive_directory_iterator&& rhs) noexcept;

recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);

void pop();
void pop(error_code& ec);
void disable_recursion_pending();

bool operator==(default_sentinel_t) const noexcept {
 return *this == recursive_directory_iterator();
}

// other members as required by 25.3.5.3, input iterators
};

}

```

- <sup>2</sup> Calling `options`, `depth`, `recursion_pending`, `pop` or `disable_recursion_pending` on an iterator that is not dereferenceable results in undefined behavior.
- <sup>3</sup> The behavior of a `recursive_directory_iterator` is the same as a `directory_iterator` unless otherwise specified.
- <sup>4</sup> [Note 1: If the directory structure being iterated over contains cycles then it is possible that the end iterator is unreachable. — end note]

### 31.12.12.2 Members

[fs.rec.dir.itr.members]

`recursive_directory_iterator()` noexcept;

- <sup>1</sup> *Effects:* Constructs the end iterator.

```

explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);

```

- <sup>2</sup> *Effects:* Constructs an iterator representing the first entry in the directory to which `p` resolves, if any; otherwise, the end iterator. However, if

(options & directory\_options::skip\_permission\_denied) != directory\_options::none and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

3     *Postconditions:* options() == options for the signatures with a directory\_options argument, otherwise options() == directory\_options::none.

4     *Throws:* As specified in 31.12.5.

5     *[Note 1:* Use recursive\_directory\_iterator(".") rather than recursive\_directory\_iterator("") to iterate over the current directory. —end note]

6     *[Note 2:* By default, recursive\_directory\_iterator does not follow directory symlinks. To follow directory symlinks, specify options as directory\_options::follow\_directory\_symlink. —end note]

```
recursive_directory_iterator(const recursive_directory_iterator& rhs);
```

7     *Postconditions:*

(7.1)     — options() == rhs.options()

(7.2)     — depth() == rhs.depth()

(7.3)     — recursion\_pending() == rhs.recursion\_pending()

```
recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
```

8     *Postconditions:* options(), depth(), and recursion\_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion\_pending(), respectively, had before the function call.

```
recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);
```

9     *Effects:* If \*this and rhs are the same object, the member has no effect.

10     *Postconditions:*

(10.1)     — options() == rhs.options()

(10.2)     — depth() == rhs.depth()

(10.3)     — recursion\_pending() == rhs.recursion\_pending()

11     *Returns:* \*this.

```
recursive_directory_iterator& operator=(recursive_directory_iterator&& rhs) noexcept;
```

12     *Effects:* If \*this and rhs are the same object, the member has no effect.

13     *Postconditions:* options(), depth(), and recursion\_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion\_pending(), respectively, had before the function call.

14     *Returns:* \*this.

```
directory_options options() const;
```

15     *Returns:* The value of the argument passed to the constructor for the options parameter, if present, otherwise directory\_options::none.

16     *Throws:* Nothing.

```
int depth() const;
```

17     *Returns:* The current depth of the directory tree being traversed.

*[Note 3:* The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth. —end note]

18     *Throws:* Nothing.

```
bool recursion_pending() const;
```

19     *Returns:* true if disable\_recursion\_pending() has not been called subsequent to the prior construction or increment operation, otherwise false.

20     *Throws:* Nothing.

```
recursive_directory_iterator& operator++();
```

```
recursive_directory_iterator& increment(error_code& ec);
```

21     *Effects:* As specified for the prefix increment operation of Input iterators (25.3.5.3), except that:

(21.1)     — If there are no more entries at the current depth, then if `depth() != 0` iteration over the parent directory resumes; otherwise `*this = recursive_directory_iterator()`.

(21.2)     — Otherwise if

```
recursion_pending() && is_directory((*this)->status()) &&
(!is_symlink((*this)->symlink_status()) ||
(options() & directory_options::follow_directory_symlink) != directory_options::none)
```

then either directory `(*this)->path()` is recursively iterated into or, if

```
(options() & directory_options::skip_permission_denied) != directory_options::none
```

and an error occurs indicating that permission to access directory `(*this)->path()` is denied, then directory `(*this)->path()` is treated as an empty directory and no error is reported.

22     *Returns:* `*this`.

23     *Throws:* As specified in 31.12.5.

```
void pop();
void pop(error_code& ec);
```

24     *Effects:* If `depth() == 0`, set `*this` to `recursive_directory_iterator()`. Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.

25     *Throws:* As specified in 31.12.5.

26     *Remarks:* Any copies of the previous value of `*this` are no longer required to be dereferenceable nor to be in the domain of `==`.

```
void disable_recursion_pending();
```

27     *Postconditions:* `recursion_pending() == false`.

28     *[Note 4: `disable_recursion_pending()` is used to prevent unwanted recursion into a directory. — end note]*

### 31.12.12.3 Non-member functions

[fs.rec.dir.itr.nonmembers]

1 These functions enable use of `recursive_directory_iterator` with range-based `for` statements.

```
recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;
```

2     *Returns:* `iter`.

```
recursive_directory_iterator end(recursive_directory_iterator) noexcept;
```

3     *Returns:* `recursive_directory_iterator()`.

### 31.12.13 Filesystem operation functions

[fs.op.funcs]

#### 31.12.13.1 General

[fs.op.funcs.general]

1 Filesystem operation functions query or modify files, including directories, in external storage.

2 [Note 1: Because hardware failures, network failures, file system races (31.12.2.4), and many other kinds of errors occur frequently in file system operations, any filesystem operation function, no matter how apparently innocuous, can encounter an error; see 31.12.5. — end note]

#### 31.12.13.2 Absolute

[fs.op.absolute]

```
path filesystem::absolute(const path& p);
path filesystem::absolute(const path& p, error_code& ec);
```

1     *Effects:* Composes an absolute path referencing the same file system location as `p` according to the operating system (31.12.2.3).

2     *Returns:* The composed path. The signature with argument `ec` returns `path()` if an error occurs.

3     *[Note 1: For the returned path, `rp`, `rp.is_absolute()` is true unless an error occurs. — end note]*

4     *Throws:* As specified in 31.12.5.

5     *[Note 2: To resolve symlinks or perform other sanitization that can involve queries to secondary storage, such as hard disks, consider `canonical` (31.12.13.3). — end note]*

- 6        [Note 3: Implementations are strongly encouraged to not query secondary storage, and not consider `!exists(p)`  
an error. —end note]
- 7        [Example 1: For POSIX-based operating systems, `absolute(p)` is simply `current_path()/p`. For Windows-based operating systems, `absolute` might have the same semantics as `GetFullPathNameW`. —end example]

### 31.12.13.3 Canonical

[`fs.op.canonical`]

```
path filesystem::canonical(const path& p);
path filesystem::canonical(const path& p, error_code& ec);
```

- 1        *Effects:* Converts `p` to an absolute path that has no symbolic link, dot, or dot-dot elements in its pathname in the generic format.
- 2        *Returns:* A path that refers to the same file system object as `absolute(p)`. The signature with argument `ec` returns `path()` if an error occurs.
- 3        *Throws:* As specified in [31.12.5](#).
- 4        *Remarks:* `!exists(p)` is an error.

### 31.12.13.4 Copy

[`fs.op.copy`]

```
void filesystem::copy(const path& from, const path& to);
```

- 1        *Effects:* Equivalent to `copy(from, to, copy_options::none)`.

```
void filesystem::copy(const path& from, const path& to, error_code& ec);
```

- 2        *Effects:* Equivalent to `copy(from, to, copy_options::none, ec)`.

```
void filesystem::copy(const path& from, const path& to, copy_options options);
void filesystem::copy(const path& from, const path& to, copy_options options,
 error_code& ec);
```

- 3        *Preconditions:* At most one element from each option group ([31.12.8.3](#)) is set in `options`.

- 4        *Effects:* Before the first use of `f` and `t`:

- (4.1)      — If  
               `(options & copy_options::create_symlinks) != copy_options::none ||`  
               `(options & copy_options::skip_symlinks) != copy_options::none`  
               then `auto f = symlink_status(from)` and if needed `auto t = symlink_status(to)`.

- (4.2)      — Otherwise, if  
               `(options & copy_options::copy_symlinks) != copy_options::none`  
               then `auto f = symlink_status(from)` and if needed `auto t = status(to)`.

- (4.3)      — Otherwise, `auto f = status(from)` and if needed `auto t = status(to)`.

Effects are then as follows:

- (4.4)      — If `f.type()` or `t.type()` is an implementation-defined file type ([31.12.8.2](#)), then the effects are implementation-defined.

- (4.5)      — Otherwise, an error is reported as specified in [31.12.5](#) if:

- (4.5.1)      — `exists(f)` is `false`, or

- (4.5.2)      — `equivalent(from, to)` is `true`, or

- (4.5.3)      — `is_other(f) || is_other(t)` is `true`, or

- (4.5.4)      — `is_directory(f) && is_regular_file(t)` is `true`.

- (4.6)      — Otherwise, if `is_symlink(f)`, then:

- (4.6.1)      — If `(options & copy_options::skip_symlinks) != copy_options::none` then return.

- (4.6.2)      — Otherwise if

- (4.6.3)      — `!exists(t) && (options & copy_options::copy_symlinks) != copy_options::none`

then `copy_symlink(from, to)`.

- (4.6.3)      — Otherwise report an error as specified in [31.12.5](#).

- (4.7) — Otherwise, if `is_regular_file(f)`, then:
  - (4.7.1) — If `(options & copy_options::directories_only) != copy_options::none`, then return.
  - (4.7.2) — Otherwise, if `(options & copy_options::create_symlinks) != copy_options::none`, then create a symbolic link to the source file.
  - (4.7.3) — Otherwise, if `(options & copy_options::create_hard_links) != copy_options::none`, then create a hard link to the source file.
  - (4.7.4) — Otherwise, if `is_directory(t)`, then `copy_file(from, to/from.filename(), options)`.
  - (4.7.5) — Otherwise, `copy_file(from, to, options)`.
- (4.8) — Otherwise, if
 

```
is_directory(f) &&
(options & copy_options::create_symlinks) != copy_options::none
```

 then report an error with an `error_code` argument equal to `make_error_code(errc::is_a_directory)`.
- (4.9) — Otherwise, if
 

```
is_directory(f) &&
((options & copy_options::recursive) != copy_options::none ||
options == copy_options::none)
```

 then:
  - (4.9.1) — If `exists(t)` is `false`, then `create_directory(to, from)`.
  - (4.9.2) — Then, iterate over the files in `from`, as if by
 

```
for (const directory_entry& x : directory_iterator(from))
copy(x.path(), to/x.path().filename(),
options | copy_options::in-recursive-copy);
```

 where `in-recursive-copy` is a bitmask element of `copy_options` that is not one of the elements in [31.12.8.3](#).
- (4.10) — Otherwise, for the signature with argument `ec`, `ec.clear()`.
- (4.11) — Otherwise, no effects.

5 *Throws:* As specified in [31.12.5](#).

6 *Remarks:* For the signature with argument `ec`, any library functions called by the implementation shall have an `error_code` argument if applicable.

7 [Example 1: Given this directory structure:

```
/dir1
 file1
 file2
 dir2
 file3
```

Calling `copy("/dir1", "/dir3")` would result in:

```
/dir1
 file1
 file2
 dir2
 file3
/dir3
 file1
 file2
```

Alternatively, calling `copy("/dir1", "/dir3", copy_options::recursive)` would result in:

```
/dir1
 file1
 file2
 dir2
 file3
/dir3
```

```

file1
file2
dir2
 file3
— end example]
```

### 31.12.13.5 Copy file

[fs.op.copy.file]

```
bool filesystem::copy_file(const path& from, const path& to);
bool filesystem::copy_file(const path& from, const path& to, error_code& ec);
```

1     *Returns:* `copy_file(from, to, copy_options::none)` or  
`copy_file(from, to, copy_options::none, ec)`, respectively.

2     *Throws:* As specified in [31.12.5](#).

```
bool filesystem::copy_file(const path& from, const path& to, copy_options options);
bool filesystem::copy_file(const path& from, const path& to, copy_options options,
 error_code& ec);
```

3     *Preconditions:* At most one element from each option group ([31.12.8.3](#)) is set in `options`.

4     *Effects:* As follows:

(4.1)     — Report an error as specified in [31.12.5](#) if:

(4.1.1)     — `is_regular_file(from)` is `false`, or

(4.1.2)     — `exists(to)` is `true` and `is_regular_file(to)` is `false`, or

(4.1.3)     — `exists(to)` is `true` and `equivalent(from, to)` is `true`, or

(4.1.4)     — `exists(to)` is `true` and

```
(options & (copy_options::skip_existing |
 copy_options::overwrite_existing |
 copy_options::update_existing)) == copy_options::none
```

(4.2)     — Otherwise, copy the contents and attributes of the file `from` resolves to, to the file `to` resolves to, if:

(4.2.1)     — `exists(to)` is `false`, or

(4.2.2)     — `(options & copy_options::overwrite_existing) != copy_options::none`, or

(4.2.3)     — `(options & copy_options::update_existing) != copy_options::none` and `from` is more recent than `to`, determined as if by use of the `last_write_time` function ([31.12.13.26](#)).

(4.3)     — Otherwise, no effects.

5     *Returns:* `true` if the `from` file was copied, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

6     *Throws:* As specified in [31.12.5](#).

7     *Complexity:* At most one direct or indirect invocation of `status(to)`.

### 31.12.13.6 Copy symlink

[fs.op.copy.symlink]

```
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink);
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink,
 error_code& ec) noexcept;
```

1     *Effects:* Equivalent to `function(read_symlink(existing_symlink), new_symlink)` or  
`function(read_symlink(existing_symlink, ec), new_symlink, ec)`, respectively, where in each case `function` is `create_symlink` or `create_directory_symlink` as appropriate.

2     *Throws:* As specified in [31.12.5](#).

### 31.12.13.7 Create directories

[fs.op.create.directories]

```
bool filesystem::create_directories(const path& p);
bool filesystem::create_directories(const path& p, error_code& ec);
```

1     *Effects:* Calls `create_directory()` for each element of `p` that does not exist.

2     *Returns:* `true` if a new directory was created for the directory `p` resolves to, otherwise `false`.

3     *Throws:* As specified in [31.12.5](#).

4     *Complexity:*  $\mathcal{O}(n)$  where  $n$  is the number of elements of `p`.

### 31.12.13.8 Create directory

[`fs.op.create.directory`]

```
bool filesystem::create_directory(const path& p);
bool filesystem::create_directory(const path& p, error_code& ec) noexcept;
```

1     *Effects:* Creates the directory `p` resolves to, as if by POSIX `mkdir` with a second argument of `static_cast<int>(perms::all)`. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

2     *Returns:* `true` if a new directory was created, otherwise `false`.

3     *Throws:* As specified in [31.12.5](#).

```
bool filesystem::create_directory(const path& p, const path& existing_p);
```

```
bool filesystem::create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;
```

4     *Effects:* Creates the directory `p` resolves to, with attributes copied from directory `existing_p`. The set of attributes copied is operating system dependent. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

[*Note 1:* For POSIX-based operating systems, the attributes are those copied by native API `stat(existing_p.c_str(), &attributes_stat)` followed by `mkdir(p.c_str(), attributes_stat.st_mode)`. For Windows-based operating systems, the attributes are those copied by native API `CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0)`. — *end note*]

5     *Returns:* `true` if a new directory was created with attributes copied from directory `existing_p`, otherwise `false`.

6     *Throws:* As specified in [31.12.5](#).

### 31.12.13.9 Create directory symlink

[`fs.op.create.dir.symlink`]

```
void filesystem::create_directory_symlink(const path& to, const path& new_symlink);
void filesystem::create_directory_symlink(const path& to, const path& new_symlink,
 error_code& ec) noexcept;
```

1     *Effects:* Establishes the postcondition, as if by POSIX `symlink()`.

2     *Postconditions:* `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

3     *Throws:* As specified in [31.12.5](#).

4     [*Note 1:* Some operating systems require symlink creation to identify that the link is to a directory. Thus, `create_symlink()` (instead of `create_directory_symlink()`) cannot be used reliably to create directory symlinks. — *end note*]

5     [*Note 2:* Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — *end note*]

### 31.12.13.10 Create hard link

[`fs.op.create.hard.lk`]

```
void filesystem::create_hard_link(const path& to, const path& new_hard_link);
void filesystem::create_hard_link(const path& to, const path& new_hard_link,
 error_code& ec) noexcept;
```

1     *Effects:* Establishes the postcondition, as if by POSIX `link()`.

2     *Postconditions:*

(2.1)     — `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`

(2.2)     — The contents of the file or directory `to` resolves to are unchanged.

3     *Throws:* As specified in [31.12.5](#).

4     [*Note 1:* Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file. — *end note*]

**31.12.13.11 Create symlink**

[fs.op.create.symlink]

```
void filesystem::create_symlink(const path& to, const path& new_symlink);
void filesystem::create_symlink(const path& to, const path& new_symlink,
 error_code& ec) noexcept;
```

- 1    *Effects:* Establishes the postcondition, as if by POSIX `symlink()`.
- 2    *Postconditions:* `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.
- 3    *Throws:* As specified in [31.12.5](#).
- 4    [Note 1: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — end note]

**31.12.13.12 Current path**

[fs.op.current.path]

```
path filesystem::current_path();
path filesystem::current_path(error_code& ec);
```

- 1    *Returns:* The absolute path of the current working directory, whose pathname in the native format is obtained as if by POSIX `getcwd()`. The signature with argument `ec` returns `path()` if an error occurs.
- 2    *Throws:* As specified in [31.12.5](#).
- 3    *Remarks:* The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.
- 4    [Note 1: The `current_path()` name was chosen to emphasize that the returned value is a path, not just a single directory name. — end note]
- 5    [Note 2: The current path as returned by many operating systems is a dangerous global variable and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

```
void filesystem::current_path(const path& p);
void filesystem::current_path(const path& p, error_code& ec) noexcept;
```

- 6    *Effects:* Establishes the postcondition, as if by POSIX `chdir()`.
- 7    *Postconditions:* `equivalent(p, current_path())`.
- 8    *Throws:* As specified in [31.12.5](#).
- 9    [Note 3: The current path for many operating systems is a dangerous global state and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

**31.12.13.13 Equivalent**

[fs.op.equivalent]

```
bool filesystem::equivalent(const path& p1, const path& p2);
bool filesystem::equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```

- 1    Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location.  
[Note 1: On POSIX platforms, this is determined as if by the values of the POSIX `stat` class, obtained as if by `stat()` for the two paths, having equal `st_dev` values and equal `st_ino` values. — end note]
- 2    *Returns:* `true`, if `p1` and `p2` resolve to the same file system entity, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.
- 3    *Throws:* As specified in [31.12.5](#).
- 4    *Remarks:* `!exists(p1) || !exists(p2)` is an error.

**31.12.13.14 Exists**

[fs.op.exists]

```
bool filesystem::exists(file_status s) noexcept;
```

- 1    *Returns:* `status_known(s) && s.type() != file_type::not_found`.

```
bool filesystem::exists(const path& p);
bool filesystem::exists(const path& p, error_code& ec) noexcept;
```

- 2    Let `s` be a `file_status`, determined as if by `status(p)` or `status(p, ec)`, respectively.

3       *Effects:* The signature with argument `ec` calls `ec.clear()` if `status_known(s)`.  
 4       *Returns:* `exists(s)`.  
 5       *Throws:* As specified in [31.12.5](#).

**31.12.13.15 File size**

[fs.op.file.size]

```
uintmax_t filesystem::file_size(const path& p);
uintmax_t filesystem::file_size(const path& p, error_code& ec) noexcept;
```

1       *Effects:* If `exists(p)` is `false`, an error is reported ([31.12.5](#)).  
 2       *Returns:*  
 (2.1)     — If `is_regular_file(p)`, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` class member `st_size` obtained as if by POSIX `stat()`.  
 (2.2)     — Otherwise, the result is implementation-defined.

The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

3       *Throws:* As specified in [31.12.5](#).

**31.12.13.16 Hard link count**

[fs.op.hard.lk.ct]

```
uintmax_t filesystem::hard_link_count(const path& p);
uintmax_t filesystem::hard_link_count(const path& p, error_code& ec) noexcept;
```

1       *Returns:* The number of hard links for `p`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.  
 2       *Throws:* As specified in [31.12.5](#).

**31.12.13.17 Is block file**

[fs.op.is.block.file]

```
bool filesystem::is_block_file(file_status s) noexcept;
```

1       *Returns:* `s.type() == file_type::block`.

```
bool filesystem::is_block_file(const path& p);
bool filesystem::is_block_file(const path& p, error_code& ec) noexcept;
```

2       *Returns:* `is_block_file(status(p))` or `is_block_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.  
 3       *Throws:* As specified in [31.12.5](#).

**31.12.13.18 Is character file**

[fs.op.is.char.file]

```
bool filesystem::is_character_file(file_status s) noexcept;
```

1       *Returns:* `s.type() == file_type::character`.

```
bool filesystem::is_character_file(const path& p);
bool filesystem::is_character_file(const path& p, error_code& ec) noexcept;
```

2       *Returns:* `is_character_file(status(p))` or `is_character_file(status(p, ec))`, respectively.  
 The signature with argument `ec` returns `false` if an error occurs.

3       *Throws:* As specified in [31.12.5](#).

**31.12.13.19 Is directory**

[fs.op.is.directory]

```
bool filesystem::is_directory(file_status s) noexcept;
```

1       *Returns:* `s.type() == file_type::directory`.

```
bool filesystem::is_directory(const path& p);
bool filesystem::is_directory(const path& p, error_code& ec) noexcept;
```

2       *Returns:* `is_directory(status(p))` or `is_directory(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3       *Throws:* As specified in [31.12.5](#).

**31.12.13.20 Is empty**

[fs.op.is.empty]

```
bool filesystem::is_empty(const path& p);
bool filesystem::is_empty(const path& p, error_code& ec);
```

1     *Effects:*

- (1.1)     — Determine `file_status s`, as if by `status(p)` or `status(p, ec)`, respectively.
- (1.2)     — For the signature with argument `ec`, return `false` if an error occurred.
- (1.3)     — Otherwise, if `is_directory(s)`:
  - (1.3.1)     — Create a variable `itr`, as if by `directory_iterator itr(p)` or `directory_iterator itr(p, ec)`, respectively.
  - (1.3.2)     — For the signature with argument `ec`, return `false` if an error occurred.
  - (1.3.3)     — Otherwise, return `itr == directory_iterator()`.
- (1.4)     — Otherwise:
  - (1.4.1)     — Determine `uintmax_t sz`, as if by `file_size(p)` or `file_size(p, ec)`, respectively.
  - (1.4.2)     — For the signature with argument `ec`, return `false` if an error occurred.
  - (1.4.3)     — Otherwise, return `sz == 0`.

2     *Throws:* As specified in [31.12.5](#).

**31.12.13.21 Is fifo**

[fs.op.isfifo]

```
bool filesystem::is_fifo(file_status s) noexcept;
```

1     *Returns:* `s.type() == file_type::fifo`.

```
bool filesystem::is_fifo(const path& p);
bool filesystem::is_fifo(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_fifo(status(p))` or `is_fifo(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in [31.12.5](#).

**31.12.13.22 Is other**

[fs.op.is.other]

```
bool filesystem::is_other(file_status s) noexcept;
```

1     *Returns:* `exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s)`.

```
bool filesystem::is_other(const path& p);
bool filesystem::is_other(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_other(status(p))` or `is_other(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in [31.12.5](#).

**31.12.13.23 Is regular file**

[fs.op.isregular.file]

```
bool filesystem::is_regular_file(file_status s) noexcept;
```

1     *Returns:* `s.type() == file_type::regular`.

```
bool filesystem::is_regular_file(const path& p);
```

2     *Returns:* `is_regular_file(status(p))`.

3     *Throws:* `filesystem_error` if `status(p)` would throw `filesystem_error`.

```
bool filesystem::is_regular_file(const path& p, error_code& ec) noexcept;
```

4     *Effects:* Sets `ec` as if by `status(p, ec)`.

[*Note 1:* `file_type::none`, `file_type::not_found` and `file_type::unknown` cases set `ec` to error values. To distinguish between cases, call the `status` function directly. — *end note*]

5     *Returns:* `is_regular_file(status(p, ec))`. Returns `false` if an error occurs.

**31.12.13.24 Is socket**

[fs.op.is.socket]

```
bool filesystem::is_socket(file_status s) noexcept;
```

1     *Returns:* `s.type() == file_type::socket.`

```
bool filesystem::is_socket(const path& p);
```

```
bool filesystem::is_socket(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_socket(status(p))` or `is_socket(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in [31.12.5](#).

**31.12.13.25 Is symlink**

[fs.op.is.symlink]

```
bool filesystem::is_symlink(file_status s) noexcept;
```

1     *Returns:* `s.type() == file_type::symlink.`

```
bool filesystem::is_symlink(const path& p);
```

```
bool filesystem::is_symlink(const path& p, error_code& ec) noexcept;
```

2     *Returns:* `is_symlink(symlink_status(p))` or `is_symlink(symlink_status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3     *Throws:* As specified in [31.12.5](#).

**31.12.13.26 Last write time**

[fs.op.last.write.time]

```
file_time_type filesystem::last_write_time(const path& p);
```

```
file_time_type filesystem::last_write_time(const path& p, error_code& ec) noexcept;
```

1     *Returns:* The time of last data modification of `p`, determined as if by the value of the POSIX `stat` class member `st_mtime` obtained as if by POSIX `stat()`. The signature with argument `ec` returns `file_time_type::min()` if an error occurs.

2     *Throws:* As specified in [31.12.5](#).

```
void filesystem::last_write_time(const path& p, file_time_type new_time);
```

```
void filesystem::last_write_time(const path& p, file_time_type new_time,
 error_code& ec) noexcept;
```

3     *Effects:* Sets the time of last data modification of the file resolved to by `p` to `new_time`, as if by POSIX `futimens()`.

4     *Throws:* As specified in [31.12.5](#).

5     *[Note 1:* A postcondition of `last_write_time(p) == new_time` is not specified because it does not necessarily hold for file systems with coarse time granularity. — *end note*]

**31.12.13.27 Permissions**

[fs.op.permissions]

```
void filesystem::permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
```

```
void filesystem::permissions(const path& p, perms prms, error_code& ec) noexcept;
```

```
void filesystem::permissions(const path& p, perms prms, perm_options opts, error_code& ec);
```

1     *Preconditions:* Exactly one of the `perm_options` constants `replace`, `add`, or `remove` is present in `opts`.

2     *Effects:* Applies the action specified by `opts` to the file `p` resolves to, or to file `p` itself if `p` is a symbolic link and `perm_options::nofollow` is set in `opts`. The action is applied as if by POSIX `fchmodat()`.

3     *[Note 1:* Conceptually permissions are viewed as bits, but the actual implementation can use some other mechanism. — *end note*]

4     *Throws:* As specified in [31.12.5](#).

5     *Remarks:* The second signature behaves as if it had an additional parameter `perm_options opts` with an argument of `perm_options::replace`.

**31.12.13.28 Proximate**

[fs.op.proximate]

```
path filesystem::proximate(const path& p, error_code& ec);
```

1     *Returns:* `proximate(p, current_path(), ec)`.

2        *Throws:* As specified in [31.12.5](#).

```
path filesystem::proximate(const path& p, const path& base = current_path());
path filesystem::proximate(const path& p, const path& base, error_code& ec);
```

3        *Returns:* For the first form:

```
weakly_canonical(p).lexically_proximate(weakly_canonical(base));
```

For the second form:

```
weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4        *Throws:* As specified in [31.12.5](#).

### 31.12.13.29 Read symlink

[`fs.op.read.symlink`]

```
path filesystem::read_symlink(const path& p);
path filesystem::read_symlink(const path& p, error_code& ec);
```

1        *Returns:* If `p` resolves to a symbolic link, a `path` object containing the contents of that symbolic link. The signature with argument `ec` returns `path()` if an error occurs.

2        *Throws:* As specified in [31.12.5](#).

[*Note 1:* It is an error if `p` does not resolve to a symbolic link. — *end note*]

### 31.12.13.30 Relative

[`fs.op.relative`]

```
path filesystem::relative(const path& p, error_code& ec);
```

1        *Returns:* `relative(p, current_path(), ec)`.

2        *Throws:* As specified in [31.12.5](#).

```
path filesystem::relative(const path& p, const path& base = current_path());
path filesystem::relative(const path& p, const path& base, error_code& ec);
```

3        *Returns:* For the first form:

```
weakly_canonical(p).lexically_relative(weakly_canonical(base));
```

For the second form:

```
weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4        *Throws:* As specified in [31.12.5](#).

### 31.12.13.31 Remove

[`fs.op.remove`]

```
bool filesystem::remove(const path& p);
bool filesystem::remove(const path& p, error_code& ec) noexcept;
```

1        *Effects:* If `exists(symlink_status(p, ec))`, the file `p` is removed as if by POSIX `remove()`.

[*Note 1:* A symbolic link is itself removed, rather than the file it resolves to. — *end note*]

2        *Postconditions:* `exists(symlink_status(p))` is `false`.

3        *Returns:* `false` if `p` did not exist, otherwise `true`. The signature with argument `ec` returns `false` if an error occurs.

4        *Throws:* As specified in [31.12.5](#).

### 31.12.13.32 Remove all

[`fs.op.remove.all`]

```
uintmax_t filesystem::remove_all(const path& p);
uintmax_t filesystem::remove_all(const path& p, error_code& ec);
```

1        *Effects:* Recursively deletes the contents of `p` if it exists, then deletes file `p` itself, as if by POSIX `remove()`.

[*Note 1:* A symbolic link is itself removed, rather than the file it resolves to. — *end note*]

- 2       *Postconditions:* `exists(symlink_status(p))` is `false`.
- 3       *Returns:* The number of files removed. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.
- 4       *Throws:* As specified in [31.12.5](#).

**31.12.13.33 Rename**

[fs.op.rename]

```
void filesystem::rename(const path& old_p, const path& new_p);
void filesystem::rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

- 1       *Effects:* Renames `old_p` to `new_p`, as if by POSIX `rename()`.

[*Note 1:*

- (1.1)     — If `old_p` and `new_p` resolve to the same existing file, no action is taken.
- (1.2)     — Otherwise, the rename can include the following effects:
  - (1.2.1)     — if `new_p` resolves to an existing non-directory file, `new_p` is removed; otherwise,
  - (1.2.2)     — if `new_p` resolves to an existing directory, `new_p` is removed if empty on POSIX compliant operating systems but might be an error on other operating systems.

A symbolic link is itself renamed, rather than the file it resolves to. — *end note*]

- 2       *Throws:* As specified in [31.12.5](#).

**31.12.13.34 Resize file**

[fs.op.resize.file]

```
void filesystem::resize_file(const path& p, uintmax_t new_size);
void filesystem::resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;
```

- 1       *Effects:* Causes the size that would be returned by `file_size(p)` to be equal to `new_size`, as if by POSIX `truncate()`.

- 2       *Throws:* As specified in [31.12.5](#).

**31.12.13.35 Space**

[fs.op.space]

```
space_info filesystem::space(const path& p);
space_info filesystem::space(const path& p, error_code& ec) noexcept;
```

- 1       *Returns:* An object of type `space_info`. The value of the `space_info` object is determined as if by using POSIX `statvfs` to obtain a POSIX `struct statvfs`, and then multiplying its `f_blocks`, `f_bfree`, and `f_bavail` members by its `f_frsiz` member, and assigning the results to the `capacity`, `free`, and `available` members respectively. Any members for which the value cannot be determined shall be set to `static_cast<uintmax_t>(-1)`. For the signature with argument `ec`, all members are set to `static_cast<uintmax_t>(-1)` if an error occurs.

- 2       *Throws:* As specified in [31.12.5](#).

- 3       *Remarks:* The value of member `space_info::available` is operating system dependent.

[*Note 1:* `available` might be less than `free`. — *end note*]

**31.12.13.36 Status**

[fs.op.status]

```
file_status filesystem::status(const path& p);
```

- 1       *Effects:* As if:

```
error_code ec;
file_status result = status(p, ec);
if (result.type() == file_type::none)
 throw filesystem_error(implementation-supplied-message, p, ec);
return result;
```

- 2       *Returns:* See above.

- 3       *Throws:* `filesystem_error`.

[*Note 1:* `result` values of `file_status(file_type::not_found)` and `file_status(file_type::unknown)` are not considered failures and do not cause an exception to be thrown. — *end note*]

```
file_status filesystem::status(const path& p, error_code& ec) noexcept;
```

4     *Effects:* If possible, determines the attributes of the file *p* resolves to, as if by using POSIX `stat()` to obtain a POSIX `struct stat`. If, during attribute determination, the underlying file system API reports an error, sets *ec* to indicate the specific error reported. Otherwise, *ec.clear()*.

[*Note 2:* This allows users to inspect the specifics of underlying API errors even when the value returned by `status()` is not `file_status(file_type::none)`. — *end note*]

5     Let *prms* denote the result of `(m & perms::mask)`, where *m* is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

6     *Returns:*

(6.1)     — If *ec* != `error_code()`:

(6.1.1)     — If the specific error indicates that *p* cannot be resolved because some element of the path does not exist, returns `file_status(file_type::not_found)`.

(6.1.2)     — Otherwise, if the specific error indicates that *p* can be resolved but the attributes cannot be determined, returns `file_status(file_type::unknown)`.

(6.1.3)     — Otherwise, returns `file_status(file_type::none)`.

[*Note 3:* These semantics distinguish between *p* being known not to exist, *p* existing but not being able to determine its attributes, and there being an error that prevents even knowing if *p* exists. These distinctions are important to some use cases. — *end note*]

(6.2)     — Otherwise,

(6.2.1)     — If the attributes indicate a regular file, as if by POSIX `S_ISREG`, returns `file_status(file_type::regular, prms)`.

[*Note 4:* `file_type::regular` implies appropriate `<fstream>` operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of `file_type::regular` does not necessarily imply `<fstream>` operations would fail on a directory. — *end note*]

(6.2.2)     — Otherwise, if the attributes indicate a directory, as if by POSIX `S_ISDIR`, returns `file_status(file_type::directory, prms)`.

[*Note 5:* `file_type::directory` implies that calling `directory_iterator(p)` would succeed. — *end note*]

(6.2.3)     — Otherwise, if the attributes indicate a block special file, as if by POSIX `S_ISBLK`, returns `file_status(file_type::block, prms)`.

(6.2.4)     — Otherwise, if the attributes indicate a character special file, as if by POSIX `S_ISCHR`, returns `file_status(file_type::character, prms)`.

(6.2.5)     — Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX `S_ISFIFO`, returns `file_status(file_type::fifo, prms)`.

(6.2.6)     — Otherwise, if the attributes indicate a socket, as if by POSIX `S_ISSOCK`, returns `file_status(file_type::socket, prms)`.

(6.2.7)     — Otherwise, if the attributes indicate an implementation-defined file type (31.12.8.2), returns `file_status(file_type::A, prms)`, where *A* is the constant for the implementation-defined file type.

(6.2.8)     — Otherwise, returns `file_status(file_type::unknown, prms)`.

7     *Remarks:* If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

### 31.12.13.37 Status known

[fs.op.status.known]

```
bool filesystem::status_known(file_status s) noexcept;
```

1     *Returns:* *s.type()* != `file_type::none`.

### 31.12.13.38 Symlink status

[fs.op.symlink.status]

```
file_status filesystem::symlink_status(const path& p);
```

```
file_status filesystem::symlink_status(const path& p, error_code& ec) noexcept;
```

1    *Effects:* Same as `status()`, above, except that the attributes of `p` are determined as if by using POSIX `lstat()` to obtain a POSIX struct `stat`.

2    Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

3    *Returns:* Same as `status()`, above, except that if the attributes indicate a symbolic link, as if by POSIX `S_ISLNK`, returns `file_status(file_type::symlink, prms)`. The signature with argument `ec` returns `file_status(file_type::none)` if an error occurs.

4    *Throws:* As specified in [31.12.5](#).

5    *Remarks:* Pathname resolution terminates if `p` names a symbolic link.

**31.12.13.39 Temporary directory path**

[fs.op.temp.dir.path]

```
path filesystem::temp_directory_path();
path filesystem::temp_directory_path(error_code& ec);
```

- 1    Let `p` be an unspecified directory path suitable for temporary files.
- 2    *Effects:* If `exists(p)` is `false` or `is_directory(p)` is `false`, an error is reported ([31.12.5](#)).
- 3    *Returns:* The path `p`. The signature with argument `ec` returns `path()` if an error occurs.
- 4    *Throws:* As specified in [31.12.5](#).
- 5    [Example 1: For POSIX-based operating systems, an implementation might return the path supplied by the first environment variable found in the list `TMPDIR`, `TMP`, `TEMP`, `TEMPDIR`, or if none of these are found, `"/tmp"`.  
For Windows-based operating systems, an implementation might return the path reported by the Windows `GetTempPath` API function. — end example]

**31.12.13.40 Weakly canonical**

[fs.op.weakly.canonical]

```
path filesystem::weakly_canonical(const path& p);
path filesystem::weakly_canonical(const path& p, error_code& ec);
```

- 1    *Effects:* Using `status(p)` or `status(p, ec)`, respectively, to determine existence, return a path composed by `operator/=` from the result of calling `canonical()` with a path argument composed of the leading elements of `p` that exist, if any, followed by the elements of `p` that do not exist, if any. For the first form, `canonical()` is called without an `error_code` argument. For the second form, `canonical()` is called with `ec` as an `error_code` argument, and `path()` is returned at the first error occurrence, if any.
- 2    *Postconditions:* The returned path is in normal form ([31.12.6.2](#)).
- 3    *Returns:* `p` with symlinks resolved and the result normalized ([31.12.6.2](#)).
- 4    *Throws:* As specified in [31.12.5](#).

- <sup>1</sup> The contents and meaning of the header <cinttypes> are the same as the C standard library header <inttypes.h>, with the following changes:
- (1.1) — The header <cinttypes> includes the header <cstdint> (17.4.1) instead of <stdint.h>, and
  - (1.2) — `intmax_t` and `uintmax_t` are not required to be able to represent all values of extended integer types wider than `long long` and `unsigned long long`, respectively, and
  - (1.3) — if and only if the type `intmax_t` designates an extended integer type (6.8.2), the following function signatures are added:

```
constexpr intmax_t abs(intmax_t);
constexpr imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures `constexpr intmax_t imaxabs(intmax_t)` and `constexpr imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

SEE ALSO: ISO/IEC 9899:2018, 7.8

- <sup>2</sup> Each of the PRI macros listed in this subclause is defined if and only if the implementation defines the corresponding *typedef-name* in 17.4.1. Each of the SCN macros listed in this subclause is defined if and only if the implementation defines the corresponding *typedef-name* in 17.4.1 and has a suitable `fscanf` length modifier for the type.

# 32 Regular expressions library [re]

## 32.1 General

[re.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.
- <sup>2</sup> The following subclauses describe a basic regular expression class template and its traits that can handle char-like (23.1) template arguments, two specializations of this class template that handle sequences of `char` and `wchar_t`, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 136.

Table 136 — Regular expressions library summary [tab:re.summary]

| Subclause                        | Header  |
|----------------------------------|---------|
| 32.2 Requirements                |         |
| 32.4 Constants                   | <regex> |
| 32.5 Exception type              |         |
| 32.6 Traits                      |         |
| 32.7 Regular expression template |         |
| 32.8 Submatches                  |         |
| 32.9 Match results               |         |
| 32.10 Algorithms                 |         |
| 32.11 Iterators                  |         |
| 32.12 Grammar                    |         |

- <sup>3</sup> The ECMAScript Language Specification described in Standard Ecma-262 is called *ECMA-262* in this Clause.

## 32.2 Requirements

[re.req]

- <sup>1</sup> This subclause defines requirements on classes representing regular expression traits.  

[Note 1: The class template `regex_traits`, defined in 32.6, meets these requirements. — end note]
- <sup>2</sup> The class template `basic_regex`, defined in 32.7, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member *typedef-names* and functions in the template parameter `traits` used by the `basic_regex` class template. This subclause defines the semantics of these members.
- <sup>3</sup> To specialize class template `basic_regex` for a character container `CharT` and its related regular expression traits class `Traits`, use `basic_regex<CharT, Traits>`.
- <sup>4</sup> In the following requirements,
  - (4.1) — `X` denotes a traits class defining types and functions for the character container type `charT`;
  - (4.2) — `u` is an object of type `X`;
  - (4.3) — `v` is an object of type `const X`;
  - (4.4) — `p` is a value of type `const charT*`;
  - (4.5) — `I1` and `I2` are input iterators (25.3.5.3);
  - (4.6) — `F1` and `F2` are forward iterators (25.3.5.5);
  - (4.7) — `c` is a value of type `const charT`;
  - (4.8) — `s` is an object of type `X::string_type`;
  - (4.9) — `cs` is an object of type `const X::string_type`;
  - (4.10) — `b` is a value of type `bool`;
  - (4.11) — `I` is a value of type `int`;

- (4.12) — `cl` is an object of type `X::char_class_type`; and  
 (4.13) — `loc` is an object of type `X::locale_type`.
- 5 A traits class `X` meets the regular expression traits requirements if the following types and expressions are well-formed and have the specified semantics.

```

typename X::char_type
6 Result: charT, the character container type used in the implementation of class template basic_regex.
typename X::string_type
7 Result: basic_string<charT>
typename X::locale_type
8 Result: A copy constructible type that represents the locale used by the traits class.
typename X::char_class_type
9 Result: A bitmask type (16.3.3.3.3) representing a particular character classification.

X::length(p)
10 Result: size_t
11 Returns: The smallest i such that p[i] == 0.
12 Complexity: Linear in i.

v.translate(c)
13 Result: X::char_type
14 Returns: A character such that for any character d that is to be considered equivalent to c then v.translate(c) == v.translate(d).
v.translate_nocase(c)
15 Result: X::char_type
16 Returns: For all characters C that are to be considered equivalent to c when comparisons are to be performed without regard to case, then v.translate_nocase(c) == v.translate_nocase(C).
v.transform(F1, F2)
17 Result: X::string_type
18 Returns: A sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then v.transform(G1, G2) < v.transform(H1, H2).
v.transform_primary(F1, F2)
19 Result: X::string_type
20 Returns: A sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) when character case is not considered then v.transform_primary(G1, G2) < v.transform_primary(H1, H2).
v.lookup_collatename(F1, F2)
21 Result: X::string_type
22 Returns: A sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range [F1, F2). Returns an empty string if the character sequence is not a valid collating element.
v.lookup_classname(F1, F2, b)
23 Result: X::char_class_type
24 Returns: Converts the character sequence designated by the iterator range [F1, F2) into a value of a bitmask type that can subsequently be passed to isctype. Values returned from lookup_classname can be bitwise OR'ed together; the resulting value represents membership in either of the corresponding

```

character classes. If `b` is `true`, the returned bitmask is suitable for matching characters without regard to their case. Returns 0 if the character sequence is not the name of a character class recognized by `X`. The value returned shall be independent of the case of the characters in the sequence.

```

v.isctype(c, cl)
25 Result: bool
26 Returns: Returns true if character c is a member of one of the character classes designated by cl,
27 false otherwise.

v.value(c, I)
28 Result: int
29 Returns: Returns the value represented by the digit c in base I if the character c is a valid digit in
30 base I; otherwise returns -1.
31 [Note 2: The value of I will only be 8, 10, or 16. —end note]

u.imbue(loc)
32 Result: X::locale_type
33 Effects: Imbues u with the locale loc and returns the previous locale used by u if any.

v.getloc()
34 Result: X::locale_type
35 Returns: Returns the current locale used by v, if any.
36 [Note 3: Class template regex_traits meets the requirements for a regular expression traits class when it is specialized
37 for char or wchar_t. This class template is described in the header <regex>, and is described in 32.6. —end note]
```

### 32.3 Header `<regex>` synopsis

## 32.4 Namespace std::regex\_constants

[re.const]

### 32.4.1 General

[re.const.general]

- <sup>1</sup> The namespace `std::regex_constants` holds symbolic constants used by the regular expression library. This namespace provides three types, `syntax_option_type`, `match_flag_type`, and `error_type`, along with several constants of these types.

### 32.4.2 Bitmask type syntax\_option\_type

[re.synopt]

```

namespace std::regex_constants {
 using syntax_option_type = T1;
 inline constexpr syntax_option_type icase = unspecified;
 inline constexpr syntax_option_type nosubs = unspecified;
 inline constexpr syntax_option_type optimize = unspecified;
 inline constexpr syntax_option_type collate = unspecified;
 inline constexpr syntax_option_type ECMAScript = unspecified;
 inline constexpr syntax_option_type basic = unspecified;
 inline constexpr syntax_option_type extended = unspecified;
 inline constexpr syntax_option_type awk = unspecified;
 inline constexpr syntax_option_type grep = unspecified;
 inline constexpr syntax_option_type egrep = unspecified;
 inline constexpr syntax_option_type multiline = unspecified;
}

```

- <sup>1</sup> The type `syntax_option_type` is an implementation-defined bitmask type (16.3.3.3). Setting its elements has the effects listed in Table 137. A valid value of type `syntax_option_type` shall have at most one of the grammar elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep`, set. If no grammar element is set, the default grammar is `ECMAScript`.

### 32.4.3 Bitmask type match\_flag\_type

[re.matchflag]

```

namespace std::regex_constants {
 using match_flag_type = T2;
 inline constexpr match_flag_type match_default = {};
 inline constexpr match_flag_type match_not_bol = unspecified;
 inline constexpr match_flag_type match_not_eol = unspecified;
 inline constexpr match_flag_type match_not_bow = unspecified;
 inline constexpr match_flag_type match_not_eow = unspecified;
 inline constexpr match_flag_type match_any = unspecified;
 inline constexpr match_flag_type match_not_null = unspecified;
 inline constexpr match_flag_type match_continuous = unspecified;
 inline constexpr match_flag_type match_prev_avail = unspecified;
 inline constexpr match_flag_type format_default = {};
 inline constexpr match_flag_type format_sed = unspecified;
 inline constexpr match_flag_type format_no_copy = unspecified;
 inline constexpr match_flag_type format_first_only = unspecified;
}

```

- <sup>1</sup> The type `match_flag_type` is an implementation-defined bitmask type (16.3.3.3). The constants of that type, except for `match_default` and `format_default`, are bitmask elements. The `match_default` and `format_default` constants are empty bitmasks. Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 138 for any bitmask elements set.

Table 137 — `syntax_option_type` effects [tab:re.synopt]

| Element                 | Effect(s) if set                                                                                                                                                                                                                                                          |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>icase</code>      | Specifies that matching of regular expressions against a character container sequence shall be performed without regard to case.                                                                                                                                          |
| <code>nosubs</code>     | Specifies that no sub-expressions shall be considered to be marked, so that when a regular expression is matched against a character container sequence, no sub-expression matches shall be stored in the supplied <code>match_results</code> object.                     |
| <code>optimize</code>   | Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output. |
| <code>collate</code>    | Specifies that character ranges of the form " <code>[a-b]</code> " shall be locale sensitive.                                                                                                                                                                             |
| <code>ECMAScript</code> | Specifies that the grammar recognized by the regular expression engine shall be that used by ECMAScript in ECMA-262, as modified in <a href="#">32.12</a> .<br>SEE ALSO: ECMA-262 15.10                                                                                   |
| <code>basic</code>      | Specifies that the grammar recognized by the regular expression engine shall be that used by basic regular expressions in POSIX.<br>SEE ALSO: POSIX, Base Definitions and Headers, Section 9.3                                                                            |
| <code>extended</code>   | Specifies that the grammar recognized by the regular expression engine shall be that used by extended regular expressions in POSIX.<br>SEE ALSO: POSIX, Base Definitions and Headers, Section 9.4                                                                         |
| <code>awk</code>        | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>awk</code> in POSIX.                                                                                                                                       |
| <code>grep</code>       | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>grep</code> in POSIX.                                                                                                                                      |
| <code>egrep</code>      | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility <code>grep</code> when given the <code>-E</code> option in POSIX.                                                                                                |
| <code>multiline</code>  | Specifies that <code>^</code> shall match the beginning of a line and <code>\$</code> shall match the end of a line, if the <code>ECMAScript</code> engine is selected.                                                                                                   |

Table 138 — `regex_constants::match_flag_type` effects when obtaining a match against a character container sequence `[first, last)`. [tab:re.matchflag]

| Element                       | Effect(s) if set                                                                                                                                                                                                                                                       |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>match_not_bol</code>    | The first character in the sequence <code>[first, last)</code> shall be treated as though it is not at the beginning of a line, so the character <code>^</code> in the regular expression shall not match <code>[first, first)</code> .                                |
| <code>match_not_eol</code>    | The last character in the sequence <code>[first, last)</code> shall be treated as though it is not at the end of a line, so the character <code>"\$"</code> in the regular expression shall not match <code>[last, last)</code> .                                      |
| <code>match_not_bow</code>    | The expression <code>"\\b"</code> shall not match the sub-sequence <code>[first, first)</code> .                                                                                                                                                                       |
| <code>match_not_eow</code>    | The expression <code>"\\b"</code> shall not match the sub-sequence <code>[last, last)</code> .                                                                                                                                                                         |
| <code>match_any</code>        | If more than one match is possible then any match is an acceptable result.                                                                                                                                                                                             |
| <code>match_not_null</code>   | The expression shall not match an empty sequence.                                                                                                                                                                                                                      |
| <code>match_continuous</code> | The expression shall only match a sub-sequence that begins at <code>first</code> .                                                                                                                                                                                     |
| <code>match_prev_avail</code> | -- <code>first</code> is a valid iterator position. When this flag is set the flags <code>match_not_bol</code> and <code>match_not_bow</code> shall be ignored by the regular expression algorithms ( <a href="#">32.10</a> ) and iterators ( <a href="#">32.11</a> ). |

**Table 138 — `regex_constants::match_flag_type` effects when obtaining a match against a character container sequence [`first`, `last`]. (continued)**

| Element                        | Effect(s) if set                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>format_default</code>    | When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the ECMAScript replace function in ECMA-262, part 15.5.4.11 <code>String.prototype.replace</code> . In addition, during search and replace operations all non-overlapping occurrences of the regular expression shall be located and replaced, and sections of the input that did not match the expression shall be copied unchanged to the output string. |
| <code>format_sed</code>        | When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX.                                                                                                                                                                                                                                                                                                                                  |
| <code>format_no_copy</code>    | During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.                                                                                                                                                                                                                                                                                                     |
| <code>format_first_only</code> | When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.                                                                                                                                                                                                                                                                                                                                                              |

**32.4.4 Implementation-defined `error_type`**

[re.err]

```
namespace std::regex_constants {
 using error_type = T3;
 inline constexpr error_type error_collate = unspecified;
 inline constexpr error_type error_ctype = unspecified;
 inline constexpr error_type error_escape = unspecified;
 inline constexpr error_type error_backref = unspecified;
 inline constexpr error_type error_brack = unspecified;
 inline constexpr error_type error_paren = unspecified;
 inline constexpr error_type error_brace = unspecified;
 inline constexpr error_type error_badbrace = unspecified;
 inline constexpr error_type error_range = unspecified;
 inline constexpr error_type error_space = unspecified;
 inline constexpr error_type error_badrepeat = unspecified;
 inline constexpr error_type error_complexity = unspecified;
 inline constexpr error_type error_stack = unspecified;
}
```

<sup>1</sup> The type `error_type` is an implementation-defined enumerated type (16.3.3.3.2). Values of type `error_type` represent the error conditions described in Table 139:

**Table 139 — `error_type` values in the C locale [tab:re.err]**

| Value                         | Error condition                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------|
| <code>error_collate</code>    | The expression contains an invalid collating element name.                                 |
| <code>error_ctype</code>      | The expression contains an invalid character class name.                                   |
| <code>error_escape</code>     | The expression contains an invalid escaped character, or a trailing escape.                |
| <code>error_backref</code>    | The expression contains an invalid back reference.                                         |
| <code>error_brack</code>      | The expression contains mismatched [ and ].                                                |
| <code>error_paren</code>      | The expression contains mismatched ( and ).                                                |
| <code>error_brace</code>      | The expression contains mismatched { and }                                                 |
| <code>error_badbrace</code>   | The expression contains an invalid range in a {} expression.                               |
| <code>error_range</code>      | The expression contains an invalid character range, such as [b-a] in most encodings.       |
| <code>error_space</code>      | There is insufficient memory to convert the expression into a finite state machine.        |
| <code>error_badrepeat</code>  | One of *?+{ is not preceded by a valid regular expression.                                 |
| <code>error_complexity</code> | The complexity of an attempted match against a regular expression exceeds a pre-set level. |

Table 139 — `error_type` values in the C locale (continued)

| Value                    | Error condition                                                                                                    |
|--------------------------|--------------------------------------------------------------------------------------------------------------------|
| <code>error_stack</code> | There is insufficient memory to determine whether the regular expression matches the specified character sequence. |

### 32.5 Class `regex_error`

[re.badexp]

```
namespace std {
 class regex_error : public runtime_error {
public:
 explicit regex_error(regex_constants::error_type ecode);
 regex_constants::error_type code() const;
};
```

- <sup>1</sup> The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

`regex_error(regex_constants::error_type ecode);`  
<sup>2</sup> *Postconditions:* `ecode == code()`.

`regex_constants::error_type code() const;`  
<sup>3</sup> *Returns:* The error code that was passed to the constructor.

### 32.6 Class template `regex_traits`

[re.traits]

```
namespace std {
 template<class charT>
 struct regex_traits {
 using char_type = charT;
 using string_type = basic_string<char_type>;
 using locale_type = locale;
 using char_class_type = bitmask_type;

 regex_traits();
 static size_t length(const char_type* p);
 charT translate(charT c) const;
 charT translate_nocase(charT c) const;
 template<class ForwardIterator>
 string_type transform(ForwardIterator first, ForwardIterator last) const;
 template<class ForwardIterator>
 string_type transform_primary(
 ForwardIterator first, ForwardIterator last) const;
 template<class ForwardIterator>
 string_type lookup_collatename(
 ForwardIterator first, ForwardIterator last) const;
 template<class ForwardIterator>
 char_class_type lookup_classname(
 ForwardIterator first, ForwardIterator last, bool icase = false) const;
 bool isctype(charT c, char_class_type f) const;
 int value(charT ch, int radix) const;
 locale_type imbue(locale_type l);
 locale_type getloc() const;
 };
}
```

- <sup>1</sup> The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (32.2).

`using char_class_type = bitmask_type;`  
<sup>2</sup> The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

```

static size_t length(const char_type* p);
3 Returns: char_traits<charT>::length(p).

charT translate(charT c) const;
4 Returns: c.

charT translate_nocase(charT c) const;
5 Returns: use_facet<ctype<charT>>(getloc()).tolower(c).

template<class ForwardIterator>
string_type transform(ForwardIterator first, ForwardIterator last) const;
6 Effects: As if by:
 string_type str(first, last);
 return use_facet<collate<charT>>(
 getloc().transform(str.data(), str.data() + str.length());

template<class ForwardIterator>
string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
7 Effects: If
 typeid(use_facet<collate<charT>>) == typeid(collate_byname<charT>)
and the form of the sort key returned by collate_byname<charT>::transform(first, last) is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

template<class ForwardIterator>
string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
8 Returns: A sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [first, last). Returns an empty string if the character sequence is not a valid collating element.

template<class ForwardIterator>
char_class_type lookup_classname(
 ForwardIterator first, ForwardIterator last, bool icase = false) const;
9 Returns: An unspecified value that represents the character classification named by the character sequence designated by the iterator range [first, last). If the parameter icase is true then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched.302 The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns char_class_type().

10 Remarks: For regex_traits<char>, at least the narrow character names in Table 140 shall be recognized. For regex_traits<wchar_t>, at least the wide character names in Table 140 shall be recognized.

bool isctype(charT c, char_class_type f) const;
11 Effects: Determines if the character c is a member of the character classification represented by f.

12 Returns: Given the following function declaration:
 // for exposition only
 template<class C>
 ctype_base::mask convert(typename regex_traits<C>::char_class_type f);
that returns a value in which each ctype_base::mask value corresponding to a value in f named in Table 140 is set, then the result is determined as if by:
 ctype_base::mask m = convert<charT>(f);
 const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());

```

<sup>302</sup> For example, if the parameter icase is true then `[[::lower::]]` is the same as `[[::alpha::]]`.

```

 if (ct.is(m, c)) {
 return true;
 } else if (c == ct.widen('_')) {
 charT w[1] = { ct.widen('w') };
 char_class_type x = lookup_classname(w, w+1);
 return (f&x) == x;
 } else {
 return false;
 }
}

```

[Example 1:

```

 regex_traits<char> t;
 string d("d");
 string u("upper");
 regex_traits<char>::char_class_type f;
 f = t.lookup_classname(d.begin(), d.end());
 f |= t.lookup_classname(u.begin(), u.end());
 ctype_base::mask m = convert<char>(f); // m == ctype_base::digit|ctype_base::upper
— end example]

```

[Example 2:

```

 regex_traits<char> t;
 string w("w");
 regex_traits<char>::char_class_type f;
 f = t.lookup_classname(w.begin(), w.end());
 t.isctype('A', f); // returns true
 t.isctype('_', f); // returns true
 t.isctype(' ', f); // returns false
— end example]

```

int value(charT ch, int radix) const;

13     *Preconditions:* The value of `radix` is 8, 10, or 16.

14     *Returns:* The value represented by the digit `ch` in base `radix` if the character `ch` is a valid digit in base `radix`; otherwise returns -1.

locale\_type imbue(locale\_type loc);

15     *Effects:* Imbues `this` with a copy of the locale `loc`.

[Note 1: Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`. — end note]

16     *Postconditions:* `getloc() == loc`.

17     *Returns:* If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

locale\_type getloc() const;

18     *Returns:* If no locale has been imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

## 32.7 Class template `basic_regex`

[`re.regex`]

### 32.7.1 General

[`re.regex.general`]

- 1 For a char-like type `charT`, specializations of class template `basic_regex` represent regular expressions constructed from character sequences of `charT` characters. In the rest of 32.7, `charT` denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class `basic_regex`.
- 2 Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions.

[Note 1: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this. — end note]

Table 140 — Character class names and corresponding ctype masks [tab:re.traits.classnames]

| Narrow character name | Wide character name | Corresponding ctype_base::mask value |
|-----------------------|---------------------|--------------------------------------|
| "alnum"               | L"alnum"            | ctype_base::alnum                    |
| "alpha"               | L"alpha"            | ctype_base::alpha                    |
| "blank"               | L"blank"            | ctype_base::blank                    |
| "cntrl"               | L"cntrl"            | ctype_base::cntrl                    |
| "digit"               | L"digit"            | ctype_base::digit                    |
| "d"                   | L"d"                | ctype_base::digit                    |
| "graph"               | L"graph"            | ctype_base::graph                    |
| "lower"               | L"lower"            | ctype_base::lower                    |
| "print"               | L"print"            | ctype_base::print                    |
| "punct"               | L"punct"            | ctype_base::punct                    |
| "space"               | L"space"            | ctype_base::space                    |
| "s"                   | L"s"                | ctype_base::space                    |
| "upper"               | L"upper"            | ctype_base::upper                    |
| "w"                   | L"w"                | ctype_base::alnum                    |
| "xdigit"              | L"xdigit"           | ctype_base::xdigit                   |

<sup>3</sup> The functions described in 32.7 report errors by throwing exceptions of type regex\_error.

```
namespace std {
 template<class charT, class traits = regex_traits<charT>>
 class basic_regex {
 public:
 // types
 using value_type = charT;
 using traits_type = traits;
 using string_type = typename traits::string_type;
 using flag_type = regex_constants::syntax_option_type;
 using locale_type = typename traits::locale_type;

 // 32.4.2, constants

 -> basic_regex<typename iterator_traits<ForwardIterator>::value_type>;
}

```

### 32.7.2 Constructors

[re.regex.construct]

`basic_regex();`

1 *Postconditions:* `*this` does not match any character sequence.

2 `explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);`

3 *Preconditions:* `[p, p + char_traits<charT>::length(p))` is a valid range.

3 *Effects:* The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters `[p, p + char_traits<charT>::length(p))`, and interpreted according to the flags `f`.

4 *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

5 *Throws:* `regex_error` if `[p, p + char_traits<charT>::length(p))` is not a valid regular expression.

`basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);`

6 *Preconditions:* `[p, p + len)` is a valid range.

7 *Effects:* The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters `[p, p + len)`, and interpreted according the flags specified in `f`.

8 *Postconditions:* `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

9 *Throws:* `regex_error` if `[p, p + len)` is not a valid regular expression.

```

basic_regex(const basic_regex& e);

10 Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex(basic_regex&& e) noexcept;

11 Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(), respectively, had before construction.

template<class ST, class SA>
explicit basic_regex(const basic_string<charT, ST, SA>& s,
 flag_type f = regex_constants::ECMAScript);

12 Effects: The object's internal finite state machine is constructed from the regular expression contained in the string s, and interpreted according to the flags specified in f.

13 Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

14 Throws: regex_error if s is not a valid regular expression.

template<class ForwardIterator>
basic_regex(ForwardIterator first, ForwardIterator last,
 flag_type f = regex_constants::ECMAScript);

15 Effects: The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters [first, last), and interpreted according to the flags specified in f.

16 Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

17 Throws: regex_error if the sequence [first, last) is not a valid regular expression.

basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);

18 Effects: Same as basic_regex(il.begin(), il.end(), f).

```

### 32.7.3 Assignment

[re.regex.assign]

```

basic_regex& operator=(const basic_regex& e);

1 Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex& operator=(basic_regex&& e) noexcept;

2 Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(), respectively, had before assignment. e is in a valid state with unspecified value.

basic_regex& operator=(const charT* p);

3 Effects: Equivalent to: return assign(p);

basic_regex& operator=(initializer_list<charT> il);

4 Effects: Equivalent to: return assign(il.begin(), il.end());

template<class ST, class SA>
basic_regex& operator=(const basic_string<charT, ST, SA>& s);

5 Effects: Equivalent to: return assign(s);

basic_regex& assign(const basic_regex& e);

6 Effects: Equivalent to: return *this = e;

basic_regex& assign(basic_regex&& e) noexcept;

7 Effects: Equivalent to: return *this = std::move(e);

basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);

8 Effects: Equivalent to: return assign(string_type(p), f);

basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);

9 Effects: Equivalent to: return assign(string_type(p, len), f);

```

```
template<class ST, class SA>
basic_regex& assign(const basic_string<charT, ST, SA>& s,
 flag_type f = regex_constants::ECMAScript);
```

10     *Effects:* Assigns the regular expression contained in the string `s`, interpreted according the flags specified in `f`. If an exception is thrown, `*this` is unchanged.

11     *Postconditions:* If no exception is thrown, `flags()` returns `f` and `mark_count()` returns the number of marked sub-expressions within the expression.

12     *Returns:* `*this`.

13     *Throws:* `regex_error` if `s` is not a valid regular expression.

```
template<class InputIterator>
basic_regex& assign(InputIterator first, InputIterator last,
 flag_type f = regex_constants::ECMAScript);
```

14     *Effects:* Equivalent to: `return assign(string_type(first, last), f);`

```
basic_regex& assign(initializer_list<charT> il,
 flag_type f = regex_constants::ECMAScript);
```

15     *Effects:* Equivalent to: `return assign(il.begin(), il.end(), f);`

### 32.7.4 Constant operations

[`re.regex.operations`]

```
unsigned mark_count() const;
```

1     *Effects:* Returns the number of marked sub-expressions within the regular expression.

```
flag_type flags() const;
```

2     *Effects:* Returns a copy of the regular expression syntax flags that were passed to the object's constructor or to the last call to `assign`.

### 32.7.5 Locale

[`re.regex.locale`]

```
locale_type imbue(locale_type loc);
```

1     *Effects:* Returns the result of `traits_inst.imbue(loc)` where `traits_inst` is a (default-initialized) instance of the template type argument `traits` stored within the object. After a call to `imbue` the `basic_regex` object does not match any character sequence.

```
locale_type getloc() const;
```

2     *Effects:* Returns the result of `traits_inst.getloc()` where `traits_inst` is a (default-initialized) instance of the template parameter `traits` stored within the object.

### 32.7.6 Swap

[`re.regex.swap`]

```
void swap(basic_regex& e);
```

1     *Effects:* Swaps the contents of the two regular expressions.

2     *Postconditions:* `*this` contains the regular expression that was in `e`, `e` contains the regular expression that was in `*this`.

3     *Complexity:* Constant time.

### 32.7.7 Non-member functions

[`re.regex.nonmemb`]

```
template<class charT, class traits>
void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);
```

1     *Effects:* Calls `lhs.swap(rhs)`.

## 32.8 Class template sub\_match

[`re.submatch`]

### 32.8.1 General

[`re.submatch.general`]

<sup>1</sup> Class template `sub_match` denotes the sequence of characters matched by a particular marked sub-expression.

```

namespace std {
 template<class BidirectionalIterator>
 class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
public:
 using value_type =
 typename iterator_traits<BidirectionalIterator>::value_type;
 using difference_type =
 typename iterator_traits<BidirectionalIterator>::difference_type;
 using iterator = BidirectionalIterator;
 using string_type = basic_string<value_type>;

 bool matched;

 constexpr sub_match();

 difference_type length() const;
 operator string_type() const;
 string_type str() const;

 int compare(const sub_match& s) const;
 int compare(const string_type& s) const;
 int compare(const value_type* s) const;

 void swap(sub_match& s) noexcept(see below);
};

}

```

### 32.8.2 Members

[**re.submatch.members**]

`constexpr sub_match();`

1     *Effects:* Value-initializes the `pair` base class subobject and the member `matched`.

`difference_type length() const;`

2     *Returns:* `matched` ? `distance(first, second)` : 0.

`operator string_type() const;`

3     *Returns:* `matched` ? `string_type(first, second)` : `string_type()`.

`string_type str() const;`

4     *Returns:* `matched` ? `string_type(first, second)` : `string_type()`.

`int compare(const sub_match& s) const;`

5     *Returns:* `str().compare(s.str())`.

`int compare(const string_type& s) const;`

6     *Returns:* `str().compare(s)`.

`int compare(const value_type* s) const;`

7     *Returns:* `str().compare(s)`.

`void swap(sub_match& s) noexcept(see below);`

8     *Preconditions:* `BidirectionalIterator` meets the `Cpp17Swappable` requirements ([16.4.4.3](#)).

9     *Effects:* Equivalent to:

```

this->pair<BidirectionalIterator, BidirectionalIterator>::swap(s);
std::swap(matched, s.matched);

```

10    *Remarks:* The exception specification is equivalent to `is_nothrow_swappable_v<BidirectionalIterator>`.

### 32.8.3 Non-member operators

[**re.submatch.op**]

1 Let *SM-CAT(I)* be

```

compare_three_way_result_t<basic_string<typename iterator_traits<I>::value_type>>
template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
2 Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
3 Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0).

template<class BiIter, class ST, class SA>
bool operator==(
 const sub_match<BiIter>& lhs,
 const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
4 Returns:
 lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0

template<class BiIter, class ST, class SA>
auto operator<=>(
 const sub_match<BiIter>& lhs,
 const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
5 Returns:
 static_cast<SM-CAT(BiIter)>(lhs.compare(
 typename sub_match<BiIter>::string_type(rhs.data(), rhs.size()))
 <=> 0
)

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
 const typename iterator_traits<BiIter>::value_type* rhs);
6 Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs,
 const typename iterator_traits<BiIter>::value_type* rhs);
7 Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0).

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
 const typename iterator_traits<BiIter>::value_type& rhs);
8 Returns: lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs,
 const typename iterator_traits<BiIter>::value_type& rhs);
9 Returns:
 static_cast<SM-CAT(BiIter)>(lhs.compare(
 typename sub_match<BiIter>::string_type(1, rhs))
 <=> 0
)

template<class charT, class ST, class BiIter>
basic_ostream<charT, ST>&
operator<<((basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);
10 Returns: os << m.str().

```

## 32.9 Class template `match_results`

[`re.results`]

### 32.9.1 General

[`re.results.general`]

- 1 Class template `match_results` denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.
- 2 The class template `match_results` meets the requirements of an allocator-aware container (24.2.2.5) and of a sequence container (24.2.2, 24.2.4) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of the comparison operator functions are different from those required for a container.
- 3 A default-constructed `match_results` object has no fully established result state. A match result is *ready* when, as a consequence of a completed regular expression match modifying such an object, its result state becomes fully established. The effects of calling most member functions from a `match_results` object that is not ready are undefined.
- 4 The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always `true`. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to `true`, and members `first` and `second` denote the range of characters [`first`, `second`) which formed that match. Otherwise `matched` is `false`, and members `first` and `second` point to the end of the sequence that was searched.

[*Note 1:* The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — *end note*]

```
namespace std {
 template<class BidirectionalIterator,
 class Allocator = allocator<sub_match<BidirectionalIterator>>>
 class match_results {
public:
 using value_type = sub_match<BidirectionalIterator>;
 using const_reference = const value_type&;
 using reference = value_type&;
 using const_iterator = implementation-defined;
 using iterator = const_iterator;
 using difference_type =
 typename iterator_traits<BidirectionalIterator>::difference_type;
 using size_type = typename allocator_traits<Allocator>::size_type;
 using allocator_type = Allocator;
 using char_type =
 typename iterator_traits<BidirectionalIterator>::value_type;
 using string_type = basic_string<char_type>;

 // 32.9.2, construct/copy/destroy
 match_results() : match_results(Allocator{}) {}
 explicit match_results(const Allocator& a);
 match_results(const match_results& m);
 match_results(const match_results& m, const Allocator& a);
 match_results(match_results&& m) noexcept;
 match_results(match_results&& m, const Allocator& a);
 match_results& operator=(const match_results& m);
 match_results& operator=(match_results&& m);

// 32.9.8, swap
void swap(match_results& that);
};

}

```

### 32.9.2 Constructors

[re.results.const]

- <sup>1</sup> Table 141 lists the postconditions of `match_results` copy/move constructors and copy/move assignment operators. For move operations, the results of the expressions depending on the parameter `m` denote the values they had before the respective function calls.

`explicit match_results(const Allocator& a);`

- <sup>2</sup> *Effects:* The stored `Allocator` value is constructed from `a`.

- <sup>3</sup> *Postconditions:* `ready()` returns `false`. `size()` returns 0.

`match_results(const match_results& m);`  
`match_results(const match_results& m, const Allocator& a);`

- <sup>4</sup> *Effects:* For the first form, the stored `Allocator` value is obtained as specified in 24.2.2.2. For the second form, the stored `Allocator` value is constructed from `a`.

- <sup>5</sup> *Postconditions:* As specified in Table 141.

`match_results(match_results&& m) noexcept;`  
`match_results(match_results&& m, const Allocator& a);`

- <sup>6</sup> *Effects:* For the first form, the stored `Allocator` value is move constructed from `m.get_allocator()`. For the second form, the stored `Allocator` value is constructed from `a`.

- <sup>7</sup> *Postconditions:* As specified in Table 141.

- <sup>8</sup> *Throws:* The second form throws nothing if `a == m.get_allocator()` is true.

```
match_results& operator=(const match_results& m);
9 Postconditions: As specified in Table 141.
match_results& operator=(match_results&& m);
10 Postconditions: As specified in Table 141.
```

**Table 141 — `match_results` copy/move operation postconditions** [tab:re.results.const]

| Element                  | Value                                                                   |
|--------------------------|-------------------------------------------------------------------------|
| <code>ready()</code>     | <code>m.ready()</code>                                                  |
| <code>size()</code>      | <code>m.size()</code>                                                   |
| <code>str(n)</code>      | <code>m.str(n)</code> for all non-negative integers $n < m.size()$      |
| <code>prefix()</code>    | <code>m.prefix()</code>                                                 |
| <code>suffix()</code>    | <code>m.suffix()</code>                                                 |
| <code>(*this)[n]</code>  | <code>m[n]</code> for all non-negative integers $n < m.size()$          |
| <code>length(n)</code>   | <code>m.length(n)</code> for all non-negative integers $n < m.size()$   |
| <code>position(n)</code> | <code>m.position(n)</code> for all non-negative integers $n < m.size()$ |

### 32.9.3 State

[re.results.state]

```
bool ready() const;
1 Returns: true if *this has a fully established result state, otherwise false.
```

### 32.9.4 Size

[re.results.size]

```
size_type size() const;
1 Returns: One plus the number of marked sub-expressions in the regular expression that was matched if *this represents the result of a successful match. Otherwise returns 0.
```

[Note 1: The state of a `match_results` object can be modified only by passing that object to `regex_match` or `regex_search`. Subclauses [32.10.2](#) and [32.10.3](#) specify the effects of those algorithms on their `match_results` arguments. —end note]

```
size_type max_size() const;
2 Returns: The maximum number of sub_match elements that can be stored in *this.
```

[[nodiscard]] bool empty() const;

3 Returns: `size() == 0`.

### 32.9.5 Element access

[re.results.acc]

```
difference_type length(size_type sub = 0) const;
1 Preconditions: ready() == true.
2 Returns: (*this)[sub].length().
```

```
difference_type position(size_type sub = 0) const;
3 Preconditions: ready() == true.
4 Returns: The distance from the start of the target sequence to (*this)[sub].first.
```

```
string_type str(size_type sub = 0) const;
5 Preconditions: ready() == true.
6 Returns: string_type((*this)[sub]).
```

```

const_reference operator[](size_type n) const;
7 Preconditions: ready() == true.
8 Returns: A reference to the sub_match object representing the character sequence that matched marked sub-expression n. If n == 0 then returns a reference to a sub_match object representing the character sequence that matched the whole regular expression. If n >= size() then returns a sub_match object representing an unmatched sub-expression.

const_reference prefix() const;
9 Preconditions: ready() == true.
10 Returns: A reference to the sub_match object representing the character sequence from the start of the string being matched/searched to the start of the match found.

const_reference suffix() const;
11 Preconditions: ready() == true.
12 Returns: A reference to the sub_match object representing the character sequence from the end of the match found to the end of the string being matched/searched.

const_iterator begin() const;
const_iterator cbegin() const;
13 Returns: A starting iterator that enumerates over all the sub-expressions stored in *this.

const_iterator end() const;
const_iterator cend() const;
14 Returns: A terminating iterator that enumerates over all the sub-expressions stored in *this.

```

### 32.9.6 Formatting

[re.results.form]

```

template<class OutputIter>
OutputIter format(
 OutputIter out,
 const char_type* fmt_first, const char_type* fmt_last,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
1 Preconditions: ready() == true and OutputIter meets the requirements for a Cpp17OutputIterator (25.3.5.4).
2 Effects: Copies the character sequence [fmt_first,fmt_last) to OutputIter out. Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within *this to which it refers. The bitmasks specified in flags determine which format specifiers and escape sequences are recognized.
3 Returns: out.

template<class OutputIter, class ST, class SA>
OutputIter format(
 OutputIter out,
 const basic_string<char_type, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
4 Effects: Equivalent to:
 return format(out, fmt.data(), fmt.data() + fmt.size(), flags);

template<class ST, class SA>
basic_string<char_type, ST, SA> format(
 const basic_string<char_type, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
5 Preconditions: ready() == true.
6 Effects: Constructs an empty string result of type basic_string<char_type, ST, SA> and calls:
 format(back_inserter(result), fmt, flags);
7 Returns: result.

```

```

string_type format(
 const char_type* fmt,
 regex_constants::match_flag_type flags = regex_constants::format_default) const;
8 Preconditions: ready() == true.
9 Effects: Constructs an empty string result of type string_type and calls:
 format(back_inserter(result), fmt, fmt + char_traits<char_type>::length(fmt), flags);
10 Returns: result.

```

### 32.9.7 Allocator

[re.results.all]

```
allocator_type get_allocator() const;
```

1 *Returns:* A copy of the Allocator that was passed to the object's constructor or, if that allocator has been replaced, a copy of the most recent replacement.

### 32.9.8 Swap

[re.results.swap]

```
void swap(match_results& that);
```

1 *Effects:* Swaps the contents of the two sequences.

2 *Postconditions:* \*this contains the sequence of matched sub-expressions that were in that, that contains the sequence of matched sub-expressions that were in \*this.

3 *Complexity:* Constant time.

```
template<class BidirectionalIterator, class Allocator>
void swap(match_results<BidirectionalIterator, Allocator>& m1,
 match_results<BidirectionalIterator, Allocator>& m2);
```

4 *Effects:* As if by m1.swap(m2).

### 32.9.9 Non-member functions

[re.results.nonmember]

```
template<class BidirectionalIterator, class Allocator>
bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
 const match_results<BidirectionalIterator, Allocator>& m2);
```

1 *Returns:* true if neither match result is ready, false if one match result is ready and the other is not. If both match results are ready, returns true only if:

(1.1) — m1.empty() && m2.empty(), or

(1.2) — !m1.empty() && !m2.empty(), and the following conditions are satisfied:

(1.2.1) — m1.prefix() == m2.prefix(),

(1.2.2) — m1.size() == m2.size() && equal(m1.begin(), m1.end(), m2.begin()), and

(1.2.3) — m1.suffix() == m2.suffix().

[Note 1: The algorithm equal is defined in Clause 27. — end note]

## 32.10 Regular expression algorithms

[re.alg]

### 32.10.1 Exceptions

[re.exception]

1 The algorithms described in subclause 32.10 may throw an exception of type regex\_error. If such an exception e is thrown, e.code() shall return either regex\_constants::error\_complexity or regex\_constants::error\_stack.

### 32.10.2 regex\_match

[re.alg.match]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
 match_results<BidirectionalIterator, Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 *Preconditions:* BidirectionalIterator models bidirectional\_iterator (25.3.4.12).

- 2     *Effects:* Determines whether there is a match between the regular expression `e`, and all of the character sequence `[first, last)`. The parameter `flags` is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns `true` if such a match exists, `false` otherwise.

*[Example 1:*

```
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re); // returns true, and m[0] contains "Get"
regex_match ("GetValue", m, re); // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re); // returns true, and m[0] contains "Get"
regex_match ("GetValues", m, re); // returns false
— end example]
```

- 3     *Postconditions:* `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns 0 and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in [Table 142](#).

**Table 142 — Effects of `regex_match` algorithm** [tab:re.alg.match]

| Element                         | Value                                                                                                                                                                                                                   |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>m.size()</code>           | <code>1 + e.mark_count()</code>                                                                                                                                                                                         |
| <code>m.empty()</code>          | <code>false</code>                                                                                                                                                                                                      |
| <code>m.prefix().first</code>   | <code>first</code>                                                                                                                                                                                                      |
| <code>m.prefix().second</code>  | <code>first</code>                                                                                                                                                                                                      |
| <code>m.prefix().matched</code> | <code>false</code>                                                                                                                                                                                                      |
| <code>m.suffix().first</code>   | <code>last</code>                                                                                                                                                                                                       |
| <code>m.suffix().second</code>  | <code>last</code>                                                                                                                                                                                                       |
| <code>m.suffix().matched</code> | <code>false</code>                                                                                                                                                                                                      |
| <code>m[0].first</code>         | <code>first</code>                                                                                                                                                                                                      |
| <code>m[0].second</code>        | <code>last</code>                                                                                                                                                                                                       |
| <code>m[0].matched</code>       | <code>true</code>                                                                                                                                                                                                       |
| <code>m[n].first</code>         | For all integers $0 < n < m.size()$ , the start of the sequence that matched sub-expression <code>n</code> . Alternatively, if sub-expression <code>n</code> did not participate in the match, then <code>last</code> . |
| <code>m[n].second</code>        | For all integers $0 < n < m.size()$ , the end of the sequence that matched sub-expression <code>n</code> . Alternatively, if sub-expression <code>n</code> did not participate in the match, then <code>last</code> .   |
| <code>m[n].matched</code>       | For all integers $0 < n < m.size()$ , <code>true</code> if sub-expression <code>n</code> participated in the match, <code>false</code> otherwise.                                                                       |

```
template<class BidirectionalIterator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

- 4     *Effects:* Behaves “as if” by constructing an instance of `match_results<BidirectionalIterator>` `what`, and then returning the result of `regex_match(first, last, what, e, flags)`.

```
template<class charT, class Allocator, class traits>
bool regex_match(const charT* str,
 match_results<const charT*, Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

- 5     *Returns:* `regex_match(str, str + char_traits<charT>::length(str), m, e, flags)`.

```

template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
 match_results<typename basic_string<charT, ST, SA>::const_iterator,
 Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

6 Returns: regex_match(s.begin(), s.end(), m, e, flags).

template<class charT, class traits>
bool regex_match(const charT* str,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

7 Returns: regex_match(str, str + char_traits<charT>::length(str), e, flags)

template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

8 Returns: regex_match(s.begin(), s.end(), e, flags).

```

### 32.10.3 regex\_search

[re.alg.search]

```

template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
 match_results<BidirectionalIterator, Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

```

1    *Preconditions:* BidirectionalIterator models bidirectional\_iterator (25.3.4.12).

2    *Effects:* Determines whether there is some sub-sequence within [first, last) that matches the regular expression e. The parameter flags is used to control how the expression is matched against the character sequence. Returns true if such a sequence exists, false otherwise.

3    *Postconditions:* m.ready() == true in all cases. If the function returns false, then the effect on parameter m is unspecified except that m.size() returns 0 and m.empty() returns true. Otherwise the effects on parameter m are given in Table 143.

Table 143 — Effects of regex\_search algorithm [tab:re.alg.search]

| Element            | Value                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| m.size()           | 1 + e.mark_count()                                                                                                                                                          |
| m.empty()          | false                                                                                                                                                                       |
| m.prefix().first   | first                                                                                                                                                                       |
| m.prefix().second  | m[0].first                                                                                                                                                                  |
| m.prefix().matched | m.prefix().first != m.prefix().second                                                                                                                                       |
| m.suffix().first   | m[0].second                                                                                                                                                                 |
| m.suffix().second  | last                                                                                                                                                                        |
| m.suffix().matched | m.suffix().first != m.suffix().second                                                                                                                                       |
| m[0].first         | The start of the sequence of characters that matched the regular expression                                                                                                 |
| m[0].second        | The end of the sequence of characters that matched the regular expression                                                                                                   |
| m[0].matched       | true                                                                                                                                                                        |
| m[n].first         | For all integers 0 < n < m.size(), the start of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last. |
| m[n].second        | For all integers 0 < n < m.size(), the end of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.   |

Table 143 — Effects of `regex_search` algorithm (continued)

| Element                   | Value                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------|
| <code>m[n].matched</code> | For all integers $0 < n < m.size()$ , true if sub-expression $n$ participated in the match, false otherwise. |

```

template<class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

4 Returns: regex_search(str, str + char_traits<charT>::length(str), m, e, flags).

template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
 match_results<typename basic_string<charT, ST, SA>::const_iterator,
 Allocator>& m,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

5 Returns: regex_search(s.begin(), s.end(), m, e, flags).

template<class BidirectionalIterator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

6 Effects: Behaves “as if” by constructing an object what of type match_results<BidirectionalIterator> and returning regex_search(first, last, what, e, flags).

template<class charT, class traits>
bool regex_search(const charT* str,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

7 Returns: regex_search(str, str + char_traits<charT>::length(str), e, flags).

template<class ST, class SA, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
 const basic_regex<charT, traits>& e,
 regex_constants::match_flag_type flags = regex_constants::match_default);

8 Returns: regex_search(s.begin(), s.end(), e, flags).

```

### 32.10.4 `regex_replace`

[re.alg.replace]

```

template<class OutputIterator, class BidirectionalIterator,
 class traits, class charT, class ST, class SA>
OutputIterator
regex_replace(OutputIterator out,
 BidirectionalIterator first, BidirectionalIterator last,
 const basic_regex<charT, traits>& e,
 const basic_string<charT, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);

template<class OutputIterator, class BidirectionalIterator, class traits, class charT>
OutputIterator
regex_replace(OutputIterator out,
 BidirectionalIterator first, BidirectionalIterator last,
 const basic_regex<charT, traits>& e,
 const charT* fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);

```

1 Effects: Constructs a `regex_iterator` object  $i$  as if by  
`regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)`

and uses `i` to enumerate through all of the matches `m` of type `match_results<BidirectionalIterator>` that occur within the sequence `[first, last)`. If no such matches are found and `!(flags & regex_constants::format_no_copy)`, then calls

```
out = copy(first, last, out)
```

If any matches are found then, for each such match:

(1.1) — If `!(flags & regex_constants::format_no_copy)`, calls

```
out = copy(m.prefix().first, m.prefix().second, out)
```

(1.2) — Then calls

```
out = m.format(out, fmt, flags)
```

for the first form of the function and

```
out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)
```

for the second.

Finally, if such a match is found and `!(flags & regex_constants::format_no_copy)`, calls

```
out = copy(last_m.suffix().first, last_m.suffix().second, out)
```

where `last_m` is a copy of the last match found. If `flags & regex_constants::format_first_only` is nonzero, then only the first match found is replaced.

2     *Returns:* `out`.

```
template<class traits, class charT, class ST, class SA, class FST, class FSA>
basic_string<charT, ST, SA>
 regex_replace(const basic_string<charT, ST, SA>& s,
 const basic_regex<charT, traits>& e,
 const basic_string<charT, FST, FSA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT, class ST, class SA>
basic_string<charT, ST, SA>
 regex_replace(const basic_string<charT, ST, SA>& s,
 const basic_regex<charT, traits>& e,
 const charT* fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

3     *Effects:* Constructs an empty string `result` of type `basic_string<charT, ST, SA>` and calls:

```
regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);
```

4     *Returns:* `result`.

```
template<class traits, class charT, class ST, class SA>
basic_string<charT>
 regex_replace(const charT* s,
 const basic_regex<charT, traits>& e,
 const basic_string<charT, ST, SA>& fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT>
basic_string<charT>
 regex_replace(const charT* s,
 const basic_regex<charT, traits>& e,
 const charT* fmt,
 regex_constants::match_flag_type flags = regex_constants::match_default);
```

5     *Effects:* Constructs an empty string `result` of type `basic_string<charT>` and calls:

```
regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);
```

6     *Returns:* `result`.

### 32.11 Regular expression iterators

[re.iterator]

#### 32.11.1 Class template `regex_iterator`

[re.register]

##### 32.11.1.1 General

[re.register.general]

- <sup>1</sup> The class template `regex_iterator` is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A `regex_iterator` uses `regex_search` to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time `operator++` is used, the iterator finds and stores a value of `match_results<BidirectionalIterator>`. If the end of the sequence is reached (`regex_search` returns `false`), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>*` is returned. It is impossible to store things into `regex_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```

namespace std {
 template<class BidirectionalIterator,
 class charT = typename iterator_traits<BidirectionalIterator>::value_type,
 class traits = regex_traits<charT>>
 class regex_iterator {
public:
 using regex_type = basic_regex<charT, traits>;
 using iterator_category = forward_iterator_tag;
 using iterator_concept = input_iterator_tag;
 using value_type = match_results<BidirectionalIterator>;
 using difference_type = ptrdiff_t;
 using pointer = const value_type*;
 using reference = const value_type&;
 regex_iterator();
 regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 regex_constants::match_flag_type m = regex_constants::match_default);
 regex_iterator(BidirectionalIterator, BidirectionalIterator,
 const regex_type&&,
 regex_constants::match_flag_type = regex_constants::match_default) = delete;
 regex_iterator(const regex_iterator&);
 regex_iterator& operator=(const regex_iterator&);
 bool operator==(const regex_iterator&) const;
 bool operator==(default_sentinel_t) const { return *this == regex_iterator(); }
 const value_type& operator*() const;
 const value_type* operator->() const;
 regex_iterator& operator++();
 regex_iterator operator++(int);

private:
 BidirectionalIterator begin; // exposition only
 BidirectionalIterator end; // exposition only
 const regex_type* preget; // exposition only
 regex_constants::match_flag_type flags; // exposition only
 match_results<BidirectionalIterator> match; // exposition only
 };
}

```

- <sup>2</sup> An object of type `regex_iterator` that is not an end-of-sequence iterator holds a *zero-length match* if `match[0].matched == true` and `match[0].first == match[0].second`.

[*Note 1*: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as '^', '\$', '\b', '\B'). — *end note*]

**32.11.1.2 Constructors**

[re.register.cnstr]

```
regex_iterator();

1 Effects: Constructs an end-of-sequence iterator.
```

```
regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 regex_constants::match_flag_type m = regex_constants::match_default);
```

2 Effects: Initializes begin and end to a and b, respectively, sets pregex to addressof(re), sets flags to m, then calls regex\_search(begin, end, match, \*pregex, flags). If this call returns false the constructor sets \*this to the end-of-sequence iterator.

**32.11.1.3 Comparisons**

[re.register.comp]

```
bool operator==(const regex_iterator& right) const;
```

1 Returns: true if \*this and right are both end-of-sequence iterators or if the following conditions all hold:

- (1.1) — begin == right.begin,
- (1.2) — end == right.end,
- (1.3) — pregex == right.pregex,
- (1.4) — flags == right.flags, and
- (1.5) — match[0] == right.match[0];

otherwise false.

**32.11.1.4 Indirection**

[re.register.deref]

```
const value_type& operator*() const;
```

1 Returns: match.

```
const value_type* operator->() const;
```

2 Returns: addressof(match).

**32.11.1.5 Increment**

[re.register.incr]

```
regex_iterator& operator++();
```

1 Effects: Constructs a local variable start of type BidirectionalIterator and initializes it with the value of match[0].second.

2 If the iterator holds a zero-length match and start == end the operator sets \*this to the end-of-sequence iterator and returns \*this.

3 Otherwise, if the iterator holds a zero-length match, the operator calls:

```
 regex_search(start, end, match, *pregex,
 flags | regex_constants::match_not_null | regex_constants::match_continuous)
```

If the call returns true the operator returns \*this. Otherwise the operator increments start and continues as if the most recent match was not a zero-length match.

4 If the most recent match was not a zero-length match, the operator sets flags to flags | regex\_constants::match\_prev\_avail and calls regex\_search(start, end, match, \*pregex, flags). If the call returns false the iterator sets \*this to the end-of-sequence iterator. The iterator then returns \*this.

5 In all cases in which the call to regex\_search returns true, match.prefix().first shall be equal to the previous value of match[0].second, and for each index i in the half-open range [0, match.size()) for which match[i].matched is true, match.position(i) shall return distance(begin, match[i].first).

6 [Note 1: This means that match.position(i) gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to regex\_search. — end note]

- 7 It is unspecified how the implementation makes these adjustments.
- 8 [Note 2: This means that an implementation can call an implementation-specific search function, in which case  
a program-defined specialization of `regex_search` will not be called. —end note]

```
regex_iterator operator++(int);
```

- 9 *Effects:* As if by:

```
 regex_iterator tmp = *this;
 ++(*this);
 return tmp;
```

### 32.11.2 Class template `regex_token_iterator`

[re.tokiter]

#### 32.11.2.1 General

[re.tokiter.general]

- 1 The class template `regex_token_iterator` is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a `sub_match` class template instance that represents what matched a particular sub-expression within the regular expression.
- 2 When class `regex_token_iterator` is used to enumerate a single sub-expression with index  $-1$  the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.
- 3 After it is constructed, the iterator finds and stores a value `regex_iterator<BidirectionalIterator>` `position` and sets the internal count `N` to zero. It also maintains a sequence `subs` which contains a list of the sub-expressions which will be enumerated. Every time `operator++` is used the count `N` is incremented; if `N` exceeds or equals `subs.size()`, then the iterator increments member `position` and sets count `N` to zero.
- 4 If the end of sequence is reached (`position` is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index  $-1$ , in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.
- 5 The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>*` is returned.
- 6 It is impossible to store things into `regex_token_iterators`. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
 template<class BidirectionalIterator,
 class charT = typename iterator_traits<BidirectionalIterator>::value_type,
 class traits = regex_traits<charT>>
 class regex_token_iterator {
public:
 using regex_type = basic_regex<charT, traits>;
 using iterator_category = forward_iterator_tag;
 using iterator_concept = input_iterator_tag;
 using value_type = sub_match<BidirectionalIterator>;
 using difference_type = ptrdiff_t;
 using pointer = const value_type*;
 using reference = const value_type&;

 regex_token_iterator();
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 int submatch = 0,
 regex_constants::match_flag_type m =
 regex_constants::match_default);
```

```

 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 const vector<int>& submatches,
 regex_constants::match_flag_type m =
 regex_constants::match_default);
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 initializer_list<int> submatches,
 regex_constants::match_flag_type m =
 regex_constants::match_default);
template<size_t N>
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 const int (&submatches)[N],
 regex_constants::match_flag_type m =
 regex_constants::match_default);
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type&& re,
 int submatch = 0,
 regex_constants::match_flag_type m =
 regex_constants::match_default) = delete;
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type&& re,
 const vector<int>& submatches,
 regex_constants::match_flag_type m =
 regex_constants::match_default) = delete;
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type&& re,
 initializer_list<int> submatches,
 regex_constants::match_flag_type m =
 regex_constants::match_default) = delete;
template<size_t N>
 regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type&& re,
 const int (&submatches)[N],
 regex_constants::match_flag_type m =
 regex_constants::match_default) = delete;
 regex_token_iterator(const regex_token_iterator&);
 regex_token_iterator& operator=(const regex_token_iterator&);
 bool operator==(const regex_token_iterator&) const;
 bool operator==(default_sentinel_t) const { return *this == regex_token_iterator(); }
 const value_type& operator*() const;
 const value_type* operator->() const;
 regex_token_iterator& operator++();
 regex_token_iterator operator++(int);

private:
 using position_iterator =
 regex_iterator<BidirectionalIterator, charT, traits>; // exposition only
 position_iterator position; // exposition only
 const value_type* result; // exposition only
 value_type suffix; // exposition only
 size_t N; // exposition only
 vector<int> subs; // exposition only
};

}

7 A suffix iterator is a regex_token_iterator object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member result holds a pointer to the data member suffix, the value of the member suffix.match is true, suffix.first points to the beginning of the final sequence, and suffix.second points to the end of the final sequence.7
8 [Note 1: For a suffix iterator, data member suffix.first is the same as the end of the last match found, and suffix.second is the same as the end of the target sequence. —end note]

```

- <sup>9</sup> The current match is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N]`.

### 32.11.2.2 Constructors

[re.tokiter.cnstr]

```
regex_token_iterator();
1 Effects: Constructs the end-of-sequence iterator.

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 int submatch = 0,
 regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 const vector<int>& submatches,
 regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 initializer_list<int> submatches,
 regex_constants::match_flag_type m = regex_constants::match_default);

template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
 const regex_type& re,
 const int (&submatches)[N],
 regex_constants::match_flag_type m = regex_constants::match_default);
```

- 2    *Preconditions:* Each of the initialization values of `submatches` is  $\geq -1$ .

- 3    *Effects:* The first constructor initializes the member `subs` to hold the single value `submatch`. The second, third, and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range `[begin(submatches), end(submatches)]`.

- 4    Each constructor then sets `N` to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to `-1` the constructor sets `*this` to a suffix iterator that points to the range `[a, b)`, otherwise the constructor sets `*this` to an end-of-sequence iterator.

### 32.11.2.3 Comparisons

[re.tokiter.comp]

```
bool operator==(const regex_token_iterator& right) const;
```

- 1    *Returns:* true if `*this` and `right` are both end-of-sequence iterators, or if `*this` and `right` are both suffix iterators and `suffix == right.suffix`; otherwise returns false if `*this` or `right` is an end-of-sequence iterator or a suffix iterator. Otherwise returns true if `position == right.position`, `N == right.N`, and `subs == right.subs`. Otherwise returns false.

### 32.11.2.4 Indirection

[re.tokiter.deref]

```
const value_type& operator*() const;
```

- 1    *Returns:* `*result`.

```
const value_type* operator->() const;
```

- 2    *Returns:* `result`.

### 32.11.2.5 Increment

[re.tokiter.incr]

```
regex_token_iterator& operator++();
```

- 1    *Effects:* Constructs a local variable `prev` of type `position_iterator`, initialized with the value of `position`.

- 2    If `*this` is a suffix iterator, sets `*this` to an end-of-sequence iterator.

3     Otherwise, if `N + 1 < subs.size()`, increments `N` and sets `result` to the address of the current match.

4     Otherwise, sets `N` to 0 and increments `position`. If `position` is not an end-of-sequence iterator the operator sets `result` to the address of the current match.

5     Otherwise, if any of the values stored in `subs` is equal to `-1` and `prev->suffix().length()` is not 0 the operator sets `*this` to a suffix iterator that points to the range `[prev->suffix().first, prev->suffix().second]`.

6     Otherwise, sets `*this` to an end-of-sequence iterator.

7     >Returns: `*this`

```
regex_token_iterator& operator++(int);
```

8     Effects: Constructs a copy `tmp` of `*this`, then calls `++(*this)`.

9     >Returns: `tmp`.

### 32.12 Modified ECMAScript regular expression grammar

[re.grammar]

- 1 The regular expression grammar recognized by `basic_regex` objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.
- 2 Objects of type specialization of `basic_regex` store within themselves a default-constructed instance of their `traits` template parameter, henceforth referred to as `traits_inst`. This `traits_inst` object is used to support localization of the regular expression; `basic_regex` member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.
- 3 The following productions within the ECMAScript grammar are modified as follows:

```
ClassAtom ::
-
 ClassAtomNoDash
 ClassAtomExClass
 ClassAtomCollatingElement
 ClassAtomEquivalence
```

```
IdentityEscape ::
 SourceCharacter but not c
```

- 4 The following new productions are then added:

```
ClassAtomExClass ::
 [: ClassName :]
ClassAtomCollatingElement ::
 [. ClassName .]
ClassAtomEquivalence ::
 [= ClassName =]
ClassName ::
 ClassNameCharacter
 ClassNameCharacter ClassName
ClassNameCharacter ::
 SourceCharacter but not one of . or = or :
```

- 5 The productions `ClassAtomExClass`, `ClassAtomCollatingElement` and `ClassAtomEquivalence` provide functionality equivalent to that of the same features in regular expressions in POSIX.
- 6 The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in [Table 137](#).
- 7 A `ClassName` production, when used in `ClassAtomExClass`, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid `ClassNames` are determined by the type of the traits class, but at least the following names shall be recognized: `alnum`, `alpha`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `xdigit`, `d`, `s`, `w`. In addition the following expressions shall be equivalent:

`\d` and `[:digit:]`

```
\D and [^[:digit:]]
\s and [:space:]
\S and [^[:space:]]
\w and [_[:alnum:]]
\W and [^_[:alnum:]]
```

- 8 A *ClassName* production when used in a *ClassAtomCollatingElement* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.
- 9 The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR'ed together and subsequently passed to `traits_inst.isctype`.
- 10 A *ClassName* production when used in a *ClassAtomEquivalence* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.
- 11 When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.
- 12 If the *CV* of a *UnicodeEscapeSequence* is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`.

[*Note 1*: This means that values of the form "uxxxx" that do not fit in a character are invalid. — *end note*]

- 13 Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.
- 14 The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags (32.4.3) specified when using the regular expression object in one of the regular expression algorithms (32.10). The behavior is also localized by interaction with the traits class template parameter as follows:

- (14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters `c` and `d` are compared using the following rules:

- (14.1.1) — if `(flags() & regex_constants::icase)` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d)`;
- (14.1.2) — otherwise, if `flags() & regex_constants::collate` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d)`;
- (14.1.3) — otherwise, the two characters are equal if `c == d`.

- (14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range `c1-c2` against a character `c` is conducted as follows: if `flags() & regex_constants::collate` is `false` then the character `c` is matched if `c1 <= c && c <= c2`, otherwise `c` is matched in accordance with the following algorithm:

```
string_type str1 = string_type(1,
 flags() & icase ?
 traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1,
 flags() & icase ?
 traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1,
 flags() & icase ?
 traits_inst.translate_nocase(c) : traits_inst.translate(c));
return traits_inst.transform(str1.begin(), str1.end())
 <= traits_inst.transform(str.begin(), str.end())
 && traits_inst.transform(str.begin(), str.end())
 <= traits_inst.transform(str2.begin(), str2.end());
```

- (14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing whether a collating element is a member of a primary equivalence class is conducted by first converting

the collating element and the equivalence class to sort keys using `traits::transform_primary`, and then comparing the sort keys for equality.

- (14.4) — During matching of a regular expression finite state machine against a sequence of characters, a character `c` is a member of a character class designated by an iterator range `[first, last)` if `traits_inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase))` is true.

# 33 Concurrency support library [thread]

## 33.1 General

[thread.general]

- <sup>1</sup> The following subclauses describe components to create and manage threads (6.9.2), perform mutual exclusion, and communicate conditions and values between threads, as summarized in [Table 144](#).

**Table 144 — Concurrency support library summary** [tab:thread.summary]

| Subclause                | Header                  |
|--------------------------|-------------------------|
| 33.2 Requirements        |                         |
| 33.3 Stop tokens         | <stop_token>            |
| 33.4 Threads             | <thread>                |
| 33.5 Atomic operations   | <atomic>, <stdatomic.h> |
| 33.6 Mutual exclusion    | <mutex>, <shared_mutex> |
| 33.7 Condition variables | <condition_variable>    |
| 33.8 Semaphores          | <semaphore>             |
| 33.9 Coordination types  | <latch>, <barrier>      |
| 33.10 Futures            | <future>                |
| 33.11 Safe reclamation   | <rcu>, <hazard_pointer> |

## 33.2 Requirements

[thread.req]

### 33.2.1 Template parameter names

[thread.req.paramname]

- <sup>1</sup> Throughout this Clause, the names of template parameters are used to express type requirements. **Predicate** is a function object type (22.10). Let **pred** denote an lvalue of type **Predicate**. Then the expression **pred()** shall be well-formed and the type **decltype(pred())** shall model **boolean-testable** (18.5.2). The return value of **pred()**, converted to **bool**, yields **true** if the corresponding test condition is satisfied, and **false** otherwise. If a template parameter is named **Clock**, the corresponding template argument shall be a type **C** that meets the *Cpp17Clock* requirements (29.3); the program is ill-formed if **is\_clock\_v<C>** is **false**.

### 33.2.2 Exceptions

[thread.req.exception]

- <sup>1</sup> Some functions described in this Clause are specified to throw exceptions of type **system\_error** (19.5.8). Such exceptions are thrown if any of the function's error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in [16.4.6.13](#).

[*Example 1*: Consider a function in this Clause that is specified to throw exceptions of type **system\_error** and specifies error conditions that include **operation\_not\_permitted** for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an **errno** of **EPERM** is reported by a POSIX API call used by the implementation. Since POSIX specifies an **errno** of **EPERM** when “the caller does not have the privilege to perform the operation”, the implementation maps **EPERM** to an **error\_condition** of **operation\_not\_permitted** (19.5) and an exception of type **system\_error** is thrown. — *end example*]

- <sup>2</sup> The **error\_code** reported by such an exception's **code()** member function compares equal to one of the conditions specified in the function's error condition element.

### 33.2.3 Native handles

[thread.req.native]

- <sup>1</sup> Several classes described in this Clause have members **native\_handle\_type** and **native\_handle**. The presence of these members and their semantics is implementation-defined.

[*Note 1*: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — *end note*]

### 33.2.4 Timing specifications

[**thread.req.timing**]

- 1 Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in [Clause 29](#).
- 2 Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration  $D_i$ . Ideally, this delay would be zero. Further, any contention for processor and memory resources induces a “quality of management” delay, expressed as duration  $D_m$ . The delay durations may vary from timeout to timeout, but in all cases shorter is better.
- 3 The functions whose names end in `_for` take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.<sup>303</sup> Given a duration argument  $D_t$ , the real-time duration of the timeout is  $D_t + D_i + D_m$ .
- 4 The functions whose names end in `_until` take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument  $C_t$ , the clock time point of the return from timeout should be  $C_t + D_i + D_m$  when the clock is not adjusted during the timeout. If the clock is adjusted to the time  $C_a$  during the timeout, the behavior should be as follows:
  - (4.1) — If  $C_a > C_t$ , the waiting function should wake as soon as possible, i.e.,  $C_a + D_i + D_m$ , since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.
  - (4.2) — If  $C_a \leq C_t$ , the waiting function should not time out until `Clock::now()` returns a time  $C_n \geq C_t$ , i.e., waking at  $C_t + D_i + D_m$ .

[*Note 1*: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock. — *end note*]

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between  $C_t$  and the time point of the call to the `_until` function.

*Recommended practice*: Implementations should decrease the duration of the wait when the clock is adjusted forwards.

- 5 [*Note 2*: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts can fail to provide useful functionality. — *end note*]
- 6 The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the *native resolution*.
- 7 Implementation-provided clocks that are used for these functions meet the *Cpp17TrivialClock* requirements ([29.3](#)).
- 8 A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as *timeout-related exceptions*.

[*Note 3*: Instantiations of clock, time point and duration types supplied by the implementation as specified in [29.7](#) do not throw exceptions. — *end note*]

### 33.2.5 Requirements for *Cpp17Lockable* types

[**thread.req.lockable**]

#### 33.2.5.1 In general

[**thread.req.lockable.general**]

- 1 An *execution agent* is an entity such as a thread that may perform work in parallel with other execution agents.

[*Note 1*: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks. — *end note*]

The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

- 2 [*Note 2*: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). — *end note*]

---

<sup>303</sup>) Implementations for which standard time units are meaningful will typically have a steady clock within their hardware implementation.

- <sup>3</sup> The standard library templates `unique_lock` (33.6.5.4), `shared_lock` (33.6.5.5), `scoped_lock` (33.6.5.3), `lock_guard` (33.6.5.2), `lock`, `try_lock` (33.6.6), and `condition_variable_any` (33.7.5) all operate on user-supplied lockable objects. The *Cpp17BasicLockable* requirements, the *Cpp17Lockable* requirements, the *Cpp17TimedLockable* requirements, the *Cpp17SharedLockable* requirements, and the *Cpp17SharedTimedLockable* requirements list the requirements imposed by these library types in order to acquire or release ownership of a `lock` by a given execution agent.

[*Note 3*: The nature of any lock ownership and any synchronization it entails are not part of these requirements.  
— *end note*]

- <sup>4</sup> A lock on an object `m` is said to be

- (4.1) — a *non-shared lock* if it is acquired by a call to `lock`, `try_lock`, `try_lock_for`, or `try_lock_until` on `m`, or
- (4.2) — a *shared lock* if it is acquired by a call to `lock_shared`, `try_lock_shared`, `try_lock_shared_for`, or `try_lock_shared_until` on `m`.

[*Note 4*: Only the method of lock acquisition is considered; the nature of any lock ownership is not part of these definitions. — *end note*]

### 33.2.5.2 *Cpp17BasicLockable* requirements

[**thread.req.lockable.basic**]

- <sup>1</sup> A type `L` meets the *Cpp17BasicLockable* requirements if the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

`m.lock()`

- <sup>2</sup> *Effects*: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

`m.unlock()`

- <sup>3</sup> *Preconditions*: The current execution agent holds a non-shared lock on `m`.

- <sup>4</sup> *Effects*: Releases a non-shared lock on `m` held by the current execution agent.

- <sup>5</sup> *Throws*: Nothing.

### 33.2.5.3 *Cpp17Lockable* requirements

[**thread.req.lockable.req**]

- <sup>1</sup> A type `L` meets the *Cpp17Lockable* requirements if it meets the *Cpp17BasicLockable* requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

`m.try_lock()`

- <sup>2</sup> *Effects*: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

- <sup>3</sup> *Return type*: `bool`.

- <sup>4</sup> *Returns*: `true` if the lock was acquired, otherwise `false`.

### 33.2.5.4 *Cpp17TimedLockable* requirements

[**thread.req.lockable.timed**]

- <sup>1</sup> A type `L` meets the *Cpp17TimedLockable* requirements if it meets the *Cpp17Lockable* requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of an instantiation of `duration` (29.5), and `abs_time` denotes a value of an instantiation of `time_point` (29.6)).

`m.try_lock_for(rel_time)`

- <sup>2</sup> *Effects*: Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- <sup>3</sup> *Return type*: `bool`.

- <sup>4</sup> *Returns*: `true` if the lock was acquired, otherwise `false`.

`m.try_lock_until(abs_time)`

- 5     *Effects:* Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- 6     *Return type:* `bool`.

- 7     *Returns:* `true` if the lock was acquired, otherwise `false`.

### 33.2.5.5 Cpp17SharedLockable requirements

[thread.req.lockable.shared]

- 1 A type `L` meets the *Cpp17SharedLockable* requirements if the following expressions are well-formed, have the specified semantics, and the expression `m.try_lock_shared()` has type `bool` (`m` denotes a value of type `L`):

`m.lock_shared()`

- 2     *Effects:* Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

`m.try_lock_shared()`

- 3     *Effects:* Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

- 4     *Returns:* `true` if the lock was acquired, `false` otherwise.

`m.unlock_shared()`

- 5     *Preconditions:* The current execution agent holds a shared lock on `m`.

- 6     *Effects:* Releases a shared lock on `m` held by the current execution agent.

- 7     *Throws:* Nothing.

### 33.2.5.6 Cpp17SharedTimedLockable requirements

[thread.req.lockable.shared.timed]

- 1 A type `L` meets the *Cpp17SharedTimedLockable* requirements if it meets the *Cpp17SharedLockable* requirements, and the following expressions are well-formed, have type `bool`, and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of a specialization of `chrono::duration`, and `abs_time` denotes a value of a specialization of `chrono::time_point`).

`m.try_lock_shared_for(rel_time)`

- 2     *Effects:* Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- 3     *Returns:* `true` if the lock was acquired, `false` otherwise.

`m.try_lock_shared_until(abs_time)`

- 4     *Effects:* Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- 5     *Returns:* `true` if the lock was acquired, `false` otherwise.

## 33.3 Stop tokens

[thread.stoptoken]

### 33.3.1 Introduction

[thread.stoptoken.intro]

- 1 Subclause 33.3 describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a *stop request*.

- 2 `stop_source`, `stop_token`, and `stop_callback` implement semantics of shared ownership of a *stop state*. Any `stop_source`, `stop_token`, or `stop_callback` that shares ownership of the same stop state is an *associated stop\_source*, *stop\_token*, or *stop\_callback*, respectively. The last remaining owner of the stop state automatically releases the resources associated with the stop state.

- <sup>3</sup> A `stop_token` can be passed to an operation which can either
- (3.1) — actively poll the token to check if there has been a stop request, or
  - (3.2) — register a callback using the `stop_callback` class template which will be called in the event that a stop request is made.

A stop request made via a `stop_source` will be visible to all associated `stop_token` and `stop_source` objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

- <sup>4</sup> Callbacks registered via a `stop_callback` object are called when a stop request is first made by any associated `stop_source` object.
- <sup>5</sup> Calls to the functions `request_stop`, `stop_requested`, and `stop_possible` do not introduce data races. A call to `request_stop` that returns `true` synchronizes with a call to `stop_requested` on an associated `stop_token` or `stop_source` object that returns `true`. Registration of a callback synchronizes with the invocation of that callback.

### 33.3.2 Header <stop\_token> synopsis

[`thread.stoptoken.syn`]

```
namespace std {
 // 33.3.3, class stop_token
 class stop_token;

 // 33.3.4, class stop_source
 class stop_source;

 // no-shared-stop-state indicator
 struct nostopstate_t {
 explicit nostopstate_t() = default;
 };
 inline constexpr nostopstate_t nostopstate{};

 // 33.3.5, class template stop_callback
 template<class Callback>
 class stop_callback;
}
```

### 33.3.3 Class `stop_token`

[`stoptoken`]

#### 33.3.3.1 General

[`stoptoken.general`]

- <sup>1</sup> The class `stop_token` provides an interface for querying whether a stop request has been made (`stop_requested`) or can ever be made (`stop_possible`) using an associated `stop_source` object (33.3.4). A `stop_token` can also be passed to a `stop_callback` (33.3.5) constructor to register a callback to be called when a stop request has been made from an associated `stop_source`.

```
namespace std {
 class stop_token {
 public:
 // 33.3.3.2, constructors, copy, and assignment
 stop_token() noexcept;

 stop_token(const stop_token&) noexcept;
 stop_token(stop_token&&) noexcept;
 stop_token& operator=(const stop_token&) noexcept;
 stop_token& operator=(stop_token&&) noexcept;
 ~stop_token();
 void swap(stop_token&) noexcept;

 // 33.3.3.3, stop handling
 [[nodiscard]] bool stop_requested() const noexcept;
 [[nodiscard]] bool stop_possible() const noexcept;

 [[nodiscard]] friend bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
 friend void swap(stop_token& lhs, stop_token& rhs) noexcept;
 };
}
```

**33.3.3.2 Constructors, copy, and assignment**[**stoptoken.cons**]

```

stop_token() noexcept;
1 Postconditions: stop_possible() is false and stop_requested() is false.
 [Note 1: Because the created stop_token object can never receive a stop request, no resources are allocated for
 a stop state. —end note]

stop_token(const stop_token& rhs) noexcept;
2 Postconditions: *this == rhs is true.
 [Note 2: *this and rhs share the ownership of the same stop state, if any. —end note]

stop_token(stop_token&& rhs) noexcept;
3 Postconditions: *this contains the value of rhs prior to the start of construction and rhs.stop_-
 possible() is false.

~stop_token();
4 Effects: Releases ownership of the stop state, if any.

stop_token& operator=(const stop_token& rhs) noexcept;
5 Effects: Equivalent to: stop_token(rhs).swap(*this).
6 Returns: *this.

stop_token& operator=(stop_token&& rhs) noexcept;
7 Effects: Equivalent to: stop_token(std::move(rhs)).swap(*this).
8 Returns: *this.

void swap(stop_token& rhs) noexcept;
9 Effects: Exchanges the values of *this and rhs.

```

**33.3.3.3 Members**[**stoptoken.mem**]

```

[[nodiscard]] bool stop_requested() const noexcept;
1 Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.

[[nodiscard]] bool stop_possible() const noexcept;
2 Returns: false if:
(2.1) — *this does not have ownership of a stop state, or
(2.2) — a stop request was not made and there are no associated stop_source objects;
 otherwise, true.

```

**33.3.3.4 Non-member functions**[**stoptoken.nonmembers**]

```

[[nodiscard]] bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
1 Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not
 have ownership of a stop state; otherwise false.

friend void swap(stop_token& x, stop_token& y) noexcept;
2 Effects: Equivalent to: x.swap(y).

```

**33.3.4 Class `stop_source`**[**stopsource**]**33.3.4.1 General**[**stopsource.general**]

<sup>1</sup> The class `stop_source` implements the semantics of making a stop request. A stop request made on a `stop_source` object is visible to all associated `stop_source` and `stop_token` (33.3.3) objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

```

namespace std {
 // no-shared-stop-state indicator
 struct nostopstate_t {
 explicit nostopstate_t() = default;
 };
 inline constexpr nostopstate_t nostopstate{};

 class stop_source {
 public:
 // 33.3.4.2, constructors, copy, and assignment
 stop_source();
 explicit stop_source(nostopstate_t) noexcept;

 stop_source(const stop_source&) noexcept;
 stop_source(stop_source&&) noexcept;
 stop_source& operator=(const stop_source&) noexcept;
 stop_source& operator=(stop_source&&) noexcept;
 ~stop_source();
 void swap(stop_source&) noexcept;

 // 33.3.4.3, stop handling
 [[nodiscard]] stop_token get_token() const noexcept;
 [[nodiscard]] bool stop_possible() const noexcept;
 [[nodiscard]] bool stop_requested() const noexcept;
 bool request_stop() noexcept;

 [[nodiscard]] friend bool
 operator==(const stop_source& lhs, const stop_source& rhs) noexcept;
 friend void swap(stop_source& lhs, stop_source& rhs) noexcept;
 };
}

```

### 33.3.4.2 Constructors, copy, and assignment

[stopsource.cons]

```
stop_source();
```

1      *Effects:* Initialises `*this` to have ownership of a new stop state.

2      *Postconditions:* `stop_possible()` is `true` and `stop_requested()` is `false`.

3      *Throws:* `bad_alloc` if memory cannot be allocated for the stop state.

```
explicit stop_source(nostopstate_t) noexcept;
```

4      *Postconditions:* `stop_possible()` is `false` and `stop_requested()` is `false`.

[Note 1: No resources are allocated for the state. — *end note*]

```
stop_source(const stop_source& rhs) noexcept;
```

5      *Postconditions:* `*this == rhs` is `true`.

[Note 2: `*this` and `rhs` share the ownership of the same stop state, if any. — *end note*]

```
stop_source(stop_source&& rhs) noexcept;
```

6      *Postconditions:* `*this` contains the value of `rhs` prior to the start of construction and `rhs.stop_possible()` is `false`.

```
~stop_source();
```

7      *Effects:* Releases ownership of the stop state, if any.

```
stop_source& operator=(const stop_source& rhs) noexcept;
```

8      *Effects:* Equivalent to: `stop_source(rhs).swap(*this)`.

9      *Returns:* `*this`.

```
stop_source& operator=(stop_source&& rhs) noexcept;
```

10     *Effects:* Equivalent to: `stop_source(std::move(rhs)).swap(*this)`.

11       >Returns: `*this`.  
 void swap(stop\_source& rhs) noexcept;  
 12      Effects: Exchanges the values of `*this` and `rhs`.

### 33.3.4.3 Members

[stopsource.mem]

[[nodiscard]] stop\_token get\_token() const noexcept;  
 1       >Returns: `stop_token()` if `stop_possible()` is `false`; otherwise a new associated `stop_token` object.  
 [[nodiscard]] bool stop\_possible() const noexcept;  
 2       >Returns: `true` if `*this` has ownership of a stop state; otherwise, `false`.  
 [[nodiscard]] bool stop\_requested() const noexcept;  
 3       >Returns: `true` if `*this` has ownership of a stop state that has received a stop request; otherwise, `false`.  
 bool request\_stop() noexcept;  
 4       Effects: If `*this` does not have ownership of a stop state, returns `false`. Otherwise, atomically determines whether the owned stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request are an atomic read-modify-write operation (6.9.2.2). If the request was made, the callbacks registered by associated `stop_callback` objects are synchronously called. If an invocation of a callback exits via an exception then `terminate` is invoked (14.6.2).  
*[Note 1: A stop request includes notifying all condition variables of type `condition_variable_any` temporarily registered during an interruptible wait (33.7.5.3). — end note]*  
 5       Postconditions: `stop_possible()` is `false` or `stop_requested()` is `true`.  
 6       >Returns: `true` if this call made a stop request; otherwise `false`.

### 33.3.4.4 Non-member functions

[stopsource.nonmembers]

[[nodiscard]] friend bool  
 operator==(const stop\_source& lhs, const stop\_source& rhs) noexcept;  
 1       >Returns: `true` if `lhs` and `rhs` have ownership of the same stop state or if both `lhs` and `rhs` do not have ownership of a stop state; otherwise `false`.  
 friend void swap(stop\_source& x, stop\_source& y) noexcept;  
 2       Effects: Equivalent to: `x.swap(y)`.

## 33.3.5 Class template `stop_callback`

[stopcallback]

### 33.3.5.1 General

[stopcallback.general]

```
1 namespace std {
 template<class Callback>
 class stop_callback {
 public:
 using callback_type = Callback;

 // 33.3.5.2, constructors and destructor
 template<class C>
 explicit stop_callback(const stop_token& st, C&& cb)
 noexcept(is_nothrow_constructible_v<Callback, C>);
 template<class C>
 explicit stop_callback(stop_token&& st, C&& cb)
 noexcept(is_nothrow_constructible_v<Callback, C>);
 ~stop_callback();

 stop_callback(const stop_callback&) = delete;
 stop_callback(stop_callback&&) = delete;
 stop_callback& operator=(const stop_callback&) = delete;
 stop_callback& operator=(stop_callback&&) = delete;
```

```

private:
 Callback callback; // exposition only
};

template<class Callback>
stop_callback(stop_token, Callback) -> stop_callback<Callback>;
}

```

- <sup>2</sup> *Mandates*: `stop_callback` is instantiated with an argument for the template parameter `Callback` that satisfies both `invocable` and `destructible`.
- <sup>3</sup> *Preconditions*: `stop_callback` is instantiated with an argument for the template parameter `Callback` that models both `invocable` and `destructible`.

### 33.3.5.2 Constructors and destructor

[`stopcallback.cons`]

```

template<class C>
explicit stop_callback(const stop_token& st, C&& cb)
 noexcept(is_nothrow_constructible_v<Callback, C>);

template<class C>
explicit stop_callback(stop_token&& st, C&& cb)
 noexcept(is_nothrow_constructible_v<Callback, C>);

```

- <sup>1</sup> *Constraints*: `Callback` and `C` satisfy `constructible_from<Callback, C>`.
- <sup>2</sup> *Preconditions*: `Callback` and `C` model `constructible_from<Callback, C>`.
- <sup>3</sup> *Effects*: Initializes `callback` with `std::forward<C>(cb)`. If `st.stop_requested()` is `true`, then `std::forward<Callback>(callback)()` is evaluated in the current thread before the constructor returns. Otherwise, if `st` has ownership of a stop state, acquires shared ownership of that stop state and registers the callback with that stop state such that `std::forward<Callback>(callback)()` is evaluated by the first call to `request_stop()` on an associated `stop_source`.
- <sup>4</sup> *Throws*: Any exception thrown by the initialization of `callback`.
- <sup>5</sup> *Remarks*: If evaluating `std::forward<Callback>(callback)()` exits via an exception, then `terminate` is invoked ([14.6.2](#)).

`~stop_callback();`

- <sup>6</sup> *Effects*: Unregisters the callback from the owned stop state, if any. The destructor does not block waiting for the execution of another callback registered by an associated `stop_callback`. If `callback` is concurrently executing on another thread, then the return from the invocation of `callback` strongly happens before ([6.9.2.2](#)) `callback` is destroyed. If `callback` is executing on the current thread, then the destructor does not block ([3.6](#)) waiting for the return from the invocation of `callback`. Releases ownership of the stop state, if any.

## 33.4 Threads

[`thread.threads`]

### 33.4.1 General

[`thread.threads.general`]

- <sup>1</sup> [33.4](#) describes components that can be used to create and manage threads.

[*Note 1*: These threads are intended to map one-to-one with operating system threads. — *end note*]

### 33.4.2 Header <thread> synopsis

[`thread.syn`]

```

#include <compare> // see 17.11.1

namespace std {
 // 33.4.3, class thread
 class thread;

 void swap(thread& x, thread& y) noexcept;

 // 33.4.4, class jthread
 class jthread;

```

```
// 33.4.5, namespace this_thread
namespace this_thread {
 thread::id get_id() noexcept;

 void yield() noexcept;
 template<class Clock, class Duration>
 void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
 template<class Rep, class Period>
 void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}
}
```

### 33.4.3 Class `thread`

[`thread.thread.class`]

#### 33.4.3.1 General

[`thread.thread.class.general`]

- <sup>1</sup> The class `thread` provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A `thread` object uniquely represents a particular thread of execution. That representation may be transferred to other `thread` objects in such a way that no two `thread` objects simultaneously represent the same thread of execution. A thread of execution is *detached* when no `thread` object represents that thread. Objects of class `thread` can be in a state that does not represent a thread of execution.

[*Note 1:* A `thread` object does not represent a thread of execution after default construction, after being moved from, or after a successful call to `detach` or `join`. — *end note*]

```
namespace std {
 class thread {
 public:
 // 33.4.3.2, class thread::id
 class id;
 using native_handle_type = implementation-defined; // see 33.2.3

 // construct/copy/destroy
 thread() noexcept;
 template<class F, class... Args> explicit thread(F&& f, Args&&... args);
 ~thread();
 thread(const thread&) = delete;
 thread(thread&&) noexcept;
 thread& operator=(const thread&) = delete;
 thread& operator=(thread&&) noexcept;

 // 33.4.3.6, members
 void swap(thread&) noexcept;
 bool joinable() const noexcept;
 void join();
 void detach();
 id get_id() const noexcept;
 native_handle_type native_handle(); // see 33.2.3

 // static members
 static unsigned int hardware_concurrency() noexcept;
 };
}
```

#### 33.4.3.2 Class `thread::id`

[`thread.thread.id`]

```
namespace std {
 class thread::id {
 public:
 id() noexcept;
 bool operator==(thread::id x, thread::id y) noexcept;
 strong_ordering operator<=>(thread::id x, thread::id y) noexcept;
 };
}
```

```

template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& out, thread::id id);

template<class charT> struct formatter<thread::id, charT>

// hash support
template<class T> struct hash;
template<> struct hash<thread::id>;
}

```

- <sup>1</sup> An object of type `thread::id` provides a unique identifier for each thread of execution and a single distinct value for all `thread` objects that do not represent a thread of execution ([33.4.3](#)). Each thread of execution has an associated `thread::id` object that is not equal to the `thread::id` object of any other thread of execution and that is not equal to the `thread::id` object of any `thread` object that does not represent threads of execution.
- <sup>2</sup> The *text representation* for the character type `charT` of an object of type `thread::id` is an unspecified sequence of `charT` such that, for two objects of type `thread::id` `x` and `y`, if `x == y` is true, the `thread::id` objects have the same text representation, and if `x != y` is true, the `thread::id` objects have distinct text representations.
- <sup>3</sup> `thread::id` is a trivially copyable class ([11.2](#)). The library may reuse the value of a `thread::id` of a terminated thread that can no longer be joined.
- <sup>4</sup> [Note 1: Relational operators allow `thread::id` objects to be used as keys in associative containers. — end note]

`id() noexcept;`

<sup>5</sup> *Postconditions*: The constructed object does not represent a thread of execution.

`bool operator==(thread::id x, thread::id y) noexcept;`

<sup>6</sup> *Returns*: `true` only if `x` and `y` represent the same thread of execution or neither `x` nor `y` represents a thread of execution.

`strong_ordering operator<=(thread::id x, thread::id y) noexcept;`

<sup>7</sup> Let  $P(x, y)$  be an unspecified total ordering over `thread::id` as described in [27.8](#).

<sup>8</sup> *Returns*: `strong_ordering::less` if  $P(x, y)$  is true. Otherwise, `strong_ordering::greater` if  $P(y, x)$  is true. Otherwise, `strong_ordering::equal`.

`template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<< (basic_ostream<charT, traits>& out, thread::id id);`

<sup>9</sup> *Effects*: Inserts the text representation for `charT` of `id` into `out`.

<sup>10</sup> *Returns*: `out`.

`template<class charT> struct formatter<thread::id, charT>;`

<sup>11</sup> *formatter<thread::id, charT>* interprets *format-spec* as a *thread-id-format-spec*. The syntax of format specifications is as follows:

*thread-id-format-spec*:  
 $\text{fill-and-align}_{opt} \text{width}_{opt}$

[Note 2: The productions *fill-and-align* and *width* are described in [22.14.2.2](#). — end note]

<sup>12</sup> If the *align* option is omitted it defaults to `>`.

<sup>13</sup> A `thread::id` object is formatted by writing its text representation for `charT` to the output with additional padding and adjustments as specified by the format specifiers.

`template<> struct hash<thread::id>;`

<sup>14</sup> The specialization is enabled ([22.10.19](#)).

### 33.4.3.3 Constructors

[`thread.thread.constr`]

```
thread() noexcept;
1 Effects: The object does not represent a thread of execution.
2 Postconditions: get_id() == id().
template<class F, class... Args> explicit thread(F&& f, Args&&... args);
3 Constraints: remove_cvref_t<F> is not the same type as thread.
4 Mandates: The following are all true:
(4.1) — is_constructible_v<decay_t<F>, F>,
(4.2) — (is_constructible_v<decay_t<Args>, Args> && ...), and
(4.3) — is_invocable_v<decay_t<F>, decay_t<Args>...>.
5 Effects: The new thread of execution executes
 invoke(auto(std::forward<F>(f)), // for invoke, see 22.10.5
 auto(std::forward<Args>(args))...)
```

with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

[*Note 1*: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — *end note*]

If the invocation of `invoke` terminates with an uncaught exception, `terminate` is invoked (14.6.2).

6 Synchronization: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

7 Postconditions: `get_id() != id()`. `*this` represents the newly started thread.

8 Throws: `system_error` if unable to start the new thread.

9 Error conditions:

(9.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
thread(thread&& x) noexcept;
10 Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the start of construction.
```

### 33.4.3.4 Destructor

[`thread.thread.destr`]

```
~thread();
```

1 Effects: If `joinable()`, invokes `terminate` (14.6.2). Otherwise, has no effects.

[*Note 1*: Either implicitly detaching or joining a `joinable()` thread in its destructor can result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. These bugs can be avoided by ensuring that the destructor is never executed while the thread is still joinable. — *end note*]

### 33.4.3.5 Assignment

[`thread.thread.assign`]

```
thread& operator=(thread&& x) noexcept;
```

1 Effects: If `joinable()`, invokes `terminate` (14.6.2). Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.

2 Postconditions: `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.

3 Returns: `*this`.

### 33.4.3.6 Members

[`thread.thread.member`]

```
void swap(thread& x) noexcept;
```

1 Effects: Swaps the state of `*this` and `x`.

```

 bool joinable() const noexcept;
2 Returns: get_id() != id().
void join();
3 Effects: Blocks until the thread represented by *this has completed.
4 Synchronization: The completion of the thread represented by *this synchronizes with (6.9.2) the
corresponding successful join() return.
[Note 1: Operations on *this are not synchronized. —end note]
5 Postconditions: The thread represented by *this has completed. get_id() == id().
6 Throws: system_error when an exception is required (33.2.2).
7 Error conditions:
(7.1) — resource_deadlock_would_occur — if deadlock is detected or get_id() == this_thread::
get_id().
(7.2) — no_such_process — if the thread is not valid.
(7.3) — invalid_argument — if the thread is not joinable.

void detach();
8 Effects: The thread represented by *this continues execution without the calling thread blocking.
When detach() returns, *this no longer represents the possibly continuing thread of execution. When
the thread previously represented by *this ends execution, the implementation releases any owned
resources.
9 Postconditions: get_id() == id().
10 Throws: system_error when an exception is required (33.2.2).
11 Error conditions:
(11.1) — no_such_process — if the thread is not valid.
(11.2) — invalid_argument — if the thread is not joinable.

id get_id() const noexcept;
12 Returns: A default constructed id object if *this does not represent a thread, otherwise this_-
thread::get_id() for the thread of execution represented by *this.

```

**33.4.3.7 Static members**

[thread.thread.static]

```
unsigned hardware_concurrency() noexcept;
```

1 Returns: The number of hardware thread contexts.

[Note 1: This value should only be considered to be a hint. —end note]

If this value is not computable or well-defined, an implementation should return 0.

**33.4.3.8 Specialized algorithms**

[thread.thread.algorithm]

```
void swap(thread& x, thread& y) noexcept;
```

1 Effects: As if by x.swap(y).

**33.4.4 Class jthread**

[thread.jthread.class]

**33.4.4.1 General**

[thread.jthread.class.general]

1 The class jthread provides a mechanism to create a new thread of execution. The functionality is the same
as for class thread (33.4.3) with the additional abilities to provide a stop\_token (33.3) to the new thread of
execution, make stop requests, and automatically join.

```

namespace std {
 class jthread {
public:
 // types
 using id = thread::id;
 using native_handle_type = thread::native_handle_type;

```

```

// 33.4.4.2, constructors, move, and assignment
jthread() noexcept;
template<class F, class... Args> explicit jthread(F&& f, Args&&... args);
~jthread();
jthread(const jthread&) = delete;
jthread(jthread&&) noexcept;
jthread& operator=(const jthread&) = delete;
jthread& operator=(jthread&&) noexcept;

// 33.4.4.3, members
void swap(jthread&) noexcept;
[[nodiscard]] bool joinable() const noexcept;
void join();
void detach();
[[nodiscard]] id get_id() const noexcept;
[[nodiscard]] native_handle_type native_handle(); // see 33.2.3

// 33.4.4.4, stop token handling
[[nodiscard]] stop_source get_stop_source() noexcept;
[[nodiscard]] stop_token get_stop_token() const noexcept;
bool request_stop() noexcept;

// 33.4.4.5, specialized algorithms
friend void swap(jthread& lhs, jthread& rhs) noexcept;

// 33.4.4.6, static members
[[nodiscard]] static unsigned int hardware_concurrency() noexcept;

private:
 stop_source ssource; // exposition only
};

}

```

### 33.4.4.2 Constructors, move, and assignment

[`thread.jthread.cons`]

`jthread()` noexcept;

1 *Effects*: Constructs a `jthread` object that does not represent a thread of execution.

2 *Postconditions*: `get_id() == id()` is true and `ssource.stop_possible()` is false.

`template<class F, class... Args> explicit jthread(F&& f, Args&&... args);`

3 *Constraints*: `remove_cvref_t<F>` is not the same type as `jthread`.

4 *Mandates*: The following are all true:

- (4.1) — `is_constructible_v<decay_t<F>, F>`,
- (4.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and
- (4.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...> ||`  
`is_invocable_v<decay_t<F>, stop_token, decay_t<Args>...>`.

5 *Effects*: Initializes `ssource`. The new thread of execution executes

```
invoke(auto(std::forward<F>(f)), get_stop_token(), // for invoke, see 22.10.5
 auto(std::forward<Args>(args))...)
```

if that expression is well-formed, otherwise

```
invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)
```

with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

[*Note 1*: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — *end note*]

If the `invoke` expression exits via an exception, `terminate` is called.

6        *Synchronization:* The completion of the invocation of the constructor synchronizes with the beginning  
of the invocation of the copy of `f`.

7        *Postconditions:* `get_id() != id()` is `true` and `ssource.stop_possible()` is `true` and `*this` repre-  
sents the newly started thread.

[Note 2: The calling thread can make a stop request only once, because it cannot replace this stop token.  
— end note]

8        *Throws:* `system_error` if unable to start the new thread.

9        *Error conditions:*

(9.1)     — `resource_unavailable_try_again` — the system lacked the necessary resources to create another  
thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
jthread(jthread&& x) noexcept;
```

10      *Postconditions:* `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the  
start of construction. `ssource` has the value of `x.ssource` prior to the start of construction and  
`x.ssource.stop_possible()` is `false`.

```
~jthread();
```

11      *Effects:* If `joinable()` is `true`, calls `request_stop()` and then `join()`.

[Note 3: Operations on `*this` are not synchronized. — end note]

```
jthread& operator=(jthread&& x) noexcept;
```

12      *Effects:* If `&x == this` is `true`, there are no effects. Otherwise, if `joinable()` is `true`, calls `request_-  
stop()` and then `join()`, then assigns the state of `x` to `*this` and sets `x` to a default constructed  
state.

13      *Postconditions:* `get_id()` returns the value of `x.get_id()` prior to the assignment. `ssource` has the  
value of `x.ssource` prior to the assignment.

14      *Returns:* `*this`.

### 33.4.4.3 Members

[`thread.jthread.mem`]

```
void swap(jthread& x) noexcept;
```

1        *Effects:* Exchanges the values of `*this` and `x`.

```
[[nodiscard]] bool joinable() const noexcept;
```

2        *Returns:* `get_id() != id()`.

```
void join();
```

3        *Effects:* Blocks until the thread represented by `*this` has completed.

4        *Synchronization:* The completion of the thread represented by `*this` synchronizes with (6.9.2) the  
corresponding successful `join()` return.

[Note 1: Operations on `*this` are not synchronized. — end note]

5        *Postconditions:* The thread represented by `*this` has completed. `get_id() == id()`.

6        *Throws:* `system_error` when an exception is required (33.2.2).

7        *Error conditions:*

(7.1)     — `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::  
get_id()`.

(7.2)     — `no_such_process` — if the thread is not valid.

(7.3)     — `invalid_argument` — if the thread is not joinable.

```
void detach();
```

8        *Effects:* The thread represented by `*this` continues execution without the calling thread blocking.  
When `detach()` returns, `*this` no longer represents the possibly continuing thread of execution. When  
the thread previously represented by `*this` ends execution, the implementation releases any owned  
resources.

9       *Postconditions:* `get_id() == id()`.  
 10      *Throws:* `system_error` when an exception is required (33.2.2).  
 11      *Error conditions:*  
 (11.1)     — `no_such_process` — if the thread is not valid.  
 (11.2)     — `invalid_argument` — if the thread is not joinable.

```
id get_id() const noexcept;
```

12      *Returns:* A default constructed `id` object if `*this` does not represent a thread, otherwise `this_thread::get_id()` for the thread of execution represented by `*this`.

**33.4.4.4 Stop token handling**

[thread.jthread.stop]

```
[[nodiscard]] stop_source get_stop_source() noexcept;
```

1       *Effects:* Equivalent to: `return ssource;`

```
[[nodiscard]] stop_token get_stop_token() const noexcept;
```

2       *Effects:* Equivalent to: `return ssource.get_token();`

```
bool request_stop() noexcept;
```

3       *Effects:* Equivalent to: `return ssource.request_stop();`

**33.4.4.5 Specialized algorithms**

[thread.jthread.special]

```
friend void swap(jthread& x, jthread& y) noexcept;
```

1       *Effects:* Equivalent to: `x.swap(y).`

**33.4.4.6 Static members**

[thread.jthread.static]

```
[[nodiscard]] static unsigned int hardware_concurrency() noexcept;
```

1       *Returns:* `thread::hardware_concurrency()`.

**33.4.5 Namespace this\_thread**

[thread.thread.this]

```
namespace std::this_thread {
 thread::id get_id() noexcept;

 void yield() noexcept;
 template<class Clock, class Duration>
 void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
 template<class Rep, class Period>
 void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}
```

```
thread::id this_thread::get_id() noexcept;
```

1       *Returns:* An object of type `thread::id` that uniquely identifies the current thread of execution. Every invocation from this thread of execution returns the same value. The object returned does not compare equal to a default-constructed `thread::id`.

```
void this_thread::yield() noexcept;
```

2       *Effects:* Offers the implementation the opportunity to reschedule.

3       *Synchronization:* None.

```
template<class Clock, class Duration>
 void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
```

4       *Effects:* Blocks the calling thread for the absolute timeout (33.2.4) specified by `abs_time`.

5       *Synchronization:* None.

6       *Throws:* Timeout-related exceptions (33.2.4).

```
template<class Rep, class Period>
void sleep_for(const chrono::duration<Rep, Period>& rel_time);

7 Effects: Blocks the calling thread for the relative timeout (33.2.4) specified by rel_time.
8 Synchronization: None.
9 Throws: Timeout-related exceptions (33.2.4).
```

### 33.5 Atomic operations

[atomics]

#### 33.5.1 General

[atomics.general]

- <sup>1</sup> Subclause 33.5 describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

#### 33.5.2 Header <atomic> synopsis

[atomics.syn]

```
namespace std {
 // 33.5.4, order and consistency
 enum class memory_order : unspecified; // freestanding
 inline constexpr memory_order memory_order_relaxed = memory_order::relaxed; // freestanding
 inline constexpr memory_order memory_order_consume = memory_order::consume; // freestanding
 inline constexpr memory_order memory_order_acquire = memory_order::acquire; // freestanding
 inline constexpr memory_order memory_order_release = memory_order::release; // freestanding
 inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel; // freestanding

### 33.5.3 Type aliases

[**atomics.alias**]

- The type aliases `atomic_intN_t`, `atomic_uintN_t`, `atomic_intptr_t`, and `atomic_uintptr_t` are defined if and only if `intN_t`, `uintN_t`, `intptr_t`, and `uintptr_t` are defined, respectively.
- The type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` name specializations of `atomic` whose template arguments are integral types, respectively signed and unsigned, and whose `is_always_lock_free` property is `true`.

[*Note 1*: These aliases are optional in freestanding implementations (16.4.2.5). — *end note*]

Implementations should choose for these aliases the integral specializations of `atomic` for which the atomic waiting and notifying operations (33.5.6) are most efficient.

### 33.5.4 Order and consistency

[**atomics.order**]

```

namespace std {
 enum class memory_order : unspecified {
 relaxed, consume, acquire, release, acq_rel, seq_cst
 };
}

```

<sup>1</sup> The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.9.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

- (1.1) — `memory_order::relaxed`: no operation orders memory.
- (1.2) — `memory_order::release`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.
- (1.3) — `memory_order::consume`: a load operation performs a consume operation on the affected memory location.

[*Note 1*: Prefer `memory_order::acquire`, which provides stronger guarantees than `memory_order::consume`. Implementations have found it infeasible to provide performance better than that of `memory_order::acquire`. Specification revisions are under consideration. — *end note*]

- (1.4) — `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

[*Note 2*: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — *end note*]

<sup>2</sup> An atomic operation *A* that performs a release operation on an atomic object *M* synchronizes with an atomic operation *B* that performs an acquire operation on *M* and takes its value from any side effect in the release sequence headed by *A*.

<sup>3</sup> An atomic operation *A* on some atomic object *M* is *coherence-ordered before* another atomic operation *B* on *M* if

- (3.1) — *A* is a modification, and *B* reads the value stored by *A*, or
- (3.2) — *A* precedes *B* in the modification order of *M*, or
- (3.3) — *A* and *B* are not the same atomic read-modify-write operation, and there exists an atomic modification *X* of *M* such that *A* reads the value stored by *X* and *X* precedes *B* in the modification order of *M*, or
- (3.4) — there exists an atomic modification *X* of *M* such that *A* is coherence-ordered before *X* and *X* is coherence-ordered before *B*.

<sup>4</sup> There is a single total order *S* on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if *A* and *B* are `memory_order::seq_cst` operations and *A* strongly happens before *B*, then *A* precedes *B* in *S*. Second, for every pair of atomic operations *A* and *B* on an object *M*, where *A* is coherence-ordered before *B*, the following four conditions are required to be satisfied by *S*:

- (4.1) — if *A* and *B* are both `memory_order::seq_cst` operations, then *A* precedes *B* in *S*; and
- (4.2) — if *A* is a `memory_order::seq_cst` operation and *B* happens before a `memory_order::seq_cst` fence *Y*, then *A* precedes *Y* in *S*; and
- (4.3) — if a `memory_order::seq_cst` fence *X* happens before *A* and *B* is a `memory_order::seq_cst` operation, then *X* precedes *B* in *S*; and
- (4.4) — if a `memory_order::seq_cst` fence *X* happens before *A* and *B* happens before a `memory_order::seq_cst` fence *Y*, then *X* precedes *Y* in *S*.

<sup>5</sup> [*Note 3*: This definition ensures that *S* is consistent with the modification order of any atomic object *M*. It also ensures that a `memory_order::seq_cst` load *A* of *M* gets its value either from the last modification of *M* that precedes *A* in *S* or from some non-`memory_order::seq_cst` modification of *M* that does not happen before any modification of *M* that precedes *A* in *S*. — *end note*]

<sup>6</sup> [*Note 4*: We do not require that *S* be consistent with “happens before” (6.9.2.2). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. — *end note*]

<sup>7</sup> [*Note 5*: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. — *end note*]

<sup>8</sup> Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[*Note 6*: For example, with *x* and *y* initially zero,

```
// Thread 1:
r1 = y.load(memory_order::relaxed);
x.store(r1, memory_order::relaxed);

// Thread 2:
r2 = x.load(memory_order::relaxed);
y.store(r2, memory_order::relaxed);
```

this recommendation discourages producing `r1 == r2 == 42`, since the store of 42 to `y` is only possible if the store to `x` stores 42, which circularly depends on the store to `y` storing 42. Note that without this restriction, such an execution is possible. — *end note*

- <sup>9</sup> [Note 7: The recommendation similarly disallows `r1 == r2 == 42` in the following example, with `x` and `y` again initially zero:

```
// Thread 1:
r1 = x.load(memory_order::relaxed);
if (r1 == 42) y.store(42, memory_order::relaxed);

// Thread 2:
r2 = y.load(memory_order::relaxed);
if (r2 == 42) x.store(42, memory_order::relaxed);
— end note]
```

- <sup>10</sup> Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

- <sup>11</sup> *Recommended practice:* The implementation should make atomic stores visible to atomic loads, and atomic loads should observe atomic stores, within a reasonable amount of time.

`template<class T>  
T kill_dependency(T y) noexcept;`

- <sup>12</sup> *Effects:* The argument does not carry a dependency to the return value (6.9.2).

- <sup>13</sup> *Returns:* `y`.

### 33.5.5 Lock-free property

[**atomics.lockfree**]

```
#define ATOMIC_BOOL_LOCK_FREE unspecified
#define ATOMIC_CHAR_LOCK_FREE unspecified
#define ATOMIC_CHAR8_T_LOCK_FREE unspecified
#define ATOMIC_CHAR16_T_LOCK_FREE unspecified
#define ATOMIC_CHAR32_T_LOCK_FREE unspecified
#define ATOMIC_WCHAR_T_LOCK_FREE unspecified
#define ATOMIC_SHORT_LOCK_FREE unspecified
#define ATOMIC_INT_LOCK_FREE unspecified
#define ATOMIC_LONG_LOCK_FREE unspecified
#define ATOMIC_LLONG_LOCK_FREE unspecified
#define ATOMIC_POINTER_LOCK_FREE unspecified
```

- <sup>1</sup> The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.

- <sup>2</sup> On a hosted implementation (16.4.2.5), at least one signed integral specialization of the `atomic` template, along with the specialization for the corresponding unsigned type (6.8.2), is always lock-free.

- <sup>3</sup> The functions `atomic<T>::is_lock_free` and `atomic_is_lock_free` (33.5.8.2) indicate whether the object is lock-free. In any given program execution, the result of the lock-free query is the same for all atomic objects of the same type.

- <sup>4</sup> Atomic operations that are not lock-free are considered to potentially block (6.9.2.3).

- <sup>5</sup> *Recommended practice:* Operations that are lock-free should also be address-free.<sup>304</sup> The implementation of these operations should not depend on any per-process state.

[*Note 1:* This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. — *end note*]

<sup>304</sup> That is, atomic operations on the same memory location via two different addresses will communicate atomically.

### 33.5.6 Waiting and notifying

[**atomics.wait**]

- <sup>1</sup> *Atomic waiting operations* and *atomic notifying operations* provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function's effects.

[*Note 1*: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met. — *end note*]

- <sup>2</sup> [*Note 2*: The following functions are atomic waiting operations:

- (2.1) — `atomic<T>::wait`,
- (2.2) — `atomic_flag::wait`,
- (2.3) — `atomic_wait` and `atomic_wait_explicit`,
- (2.4) — `atomic_flag_wait` and `atomic_flag_wait_explicit`, and
- (2.5) — `atomic_ref<T>::wait`.

— *end note*]

- <sup>3</sup> [*Note 3*: The following functions are atomic notifying operations:

- (3.1) — `atomic<T>::notify_one` and `atomic<T>::notify_all`,
- (3.2) — `atomic_flag::notify_one` and `atomic_flag::notify_all`,
- (3.3) — `atomic_notify_one` and `atomic_notify_all`,
- (3.4) — `atomic_flag_notify_one` and `atomic_flag_notify_all`, and
- (3.5) — `atomic_ref<T>::notify_one` and `atomic_ref<T>::notify_all`.

— *end note*]

- <sup>4</sup> A call to an atomic waiting operation on an atomic object M is *eligible to be unblocked* by a call to an atomic notifying operation on M if there exist side effects X and Y on M such that:

- (4.1) — the atomic waiting operation has blocked after observing the result of X,
- (4.2) — X precedes Y in the modification order of M, and
- (4.3) — Y happens before the call to the atomic notifying operation.

### 33.5.7 Class template `atomic_ref`

[**atomics.ref.generic**]

#### 33.5.7.1 General

[**atomics.ref.generic.general**]

```
namespace std {
 template<class T> struct atomic_ref {
 private:
 T* ptr; // exposition only

 public:
 using value_type = T;
 static constexpr size_t required_alignment = implementation-defined;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const noexcept;

 explicit atomic_ref(T&);
 atomic_ref(const atomic_ref&) noexcept;
 atomic_ref& operator=(const atomic_ref&) = delete;

 void store(T, memory_order = memory_order::seq_cst) const noexcept;
 T operator=(T) const noexcept;
 T load(memory_order = memory_order::seq_cst) const noexcept;
 operator T() const noexcept;

 T exchange(T, memory_order = memory_order::seq_cst) const noexcept;
 bool compare_exchange_weak(T&, T,
 memory_order, memory_order) const noexcept;
 bool compare_exchange_strong(T&, T,
 memory_order, memory_order) const noexcept;
 };
}
```

```

 bool compare_exchange_weak(T&, T,
 memory_order = memory_order::seq_cst) const noexcept;
 bool compare_exchange_strong(T&, T,
 memory_order = memory_order::seq_cst) const noexcept;

 void wait(T, memory_order = memory_order::seq_cst) const noexcept;
 void notify_one() const noexcept;
 void notify_all() const noexcept;
 };
}

```

- <sup>1</sup> An `atomic_ref` object applies atomic operations (33.5.1) to the object referenced by `*ptr` such that, for the lifetime (6.7.3) of the `atomic_ref` object, the object referenced by `*ptr` is an atomic object (6.9.2.2).
- <sup>2</sup> The program is ill-formed if `is_trivially_copyable_v<T>` is `false`.
- <sup>3</sup> The lifetime (6.7.3) of an object referenced by `*ptr` shall exceed the lifetime of all `atomic_refs` that reference the object. While any `atomic_ref` instances exist that reference the `*ptr` object, all accesses to that object shall exclusively occur through those `atomic_ref` instances. No subobject of the object referenced by `atomic_ref` shall be concurrently referenced by any other `atomic_ref` object.
- <sup>4</sup> Atomic operations applied to an object through a referencing `atomic_ref` are atomic with respect to atomic operations applied through any other `atomic_ref` referencing the same object.

[Note 1: Atomic operations or the `atomic_ref` constructor can acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object. — end note]

### 33.5.7.2 Operations

[atomics.ref.ops]

```
static constexpr size_t required_alignment;
```

- <sup>1</sup> The alignment required for an object to be referenced by an atomic reference, which is at least `alignof(T)`.
- <sup>2</sup> [Note 1: Hardware could require an object referenced by an `atomic_ref` to have stricter alignment (6.7.6) than other objects of type `T`. Further, whether operations on an `atomic_ref` are lock-free could depend on the alignment of the referenced object. For example, lock-free operations on `std::complex<double>` could be supported only if aligned to `2*alignof(double)`. — end note]

```
static constexpr bool is_always_lock_free;
```

- <sup>3</sup> The static data member `is_always_lock_free` is `true` if the `atomic_ref` type's operations are always lock-free, and `false` otherwise.

```
bool is_lock_free() const noexcept;
```

- <sup>4</sup> Returns: `true` if operations on all objects of the type `atomic_ref<T>` are lock-free, `false` otherwise.

```
atomic_ref(T& obj);
```

- <sup>5</sup> Preconditions: The referenced object is aligned to `required_alignment`.

- <sup>6</sup> Postconditions: `*this` references `obj`.

- <sup>7</sup> Throws: Nothing.

```
atomic_ref(const atomic_ref& ref) noexcept;
```

- <sup>8</sup> Postconditions: `*this` references the object referenced by `ref`.

```
void store(T desired, memory_order order = memory_order::seq_cst) const noexcept;
```

- <sup>9</sup> Preconditions: `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

- <sup>10</sup> Effects: Atomically replaces the value referenced by `*ptr` with the value of `desired`. Memory is affected according to the value of `order`.

```
T operator=(T desired) const noexcept;
```

- <sup>11</sup> Effects: Equivalent to:

```
 store(desired);
 return desired;
```

12     T load(memory\_order order = memory\_order::seq\_cst) const noexcept;  
     *Preconditions:* order is memory\_order::relaxed, memory\_order::consume, memory\_order::acquire, or memory\_order::seq\_cst.  
     *Effects:* Memory is affected according to the value of order.  
     *Returns:* Atomically returns the value referenced by \*ptr.

13     operator T() const noexcept;  
     *Effects:* Equivalent to: return load();

14     T exchange(T desired, memory\_order order = memory\_order::seq\_cst) const noexcept;  
     *Effects:* Atomically replaces the value referenced by \*ptr with desired. Memory is affected according to the value of order. This operation is an atomic read-modify-write operation (6.9.2).  
     *Returns:* Atomically returns the value referenced by \*ptr immediately before the effects.

```
bool compare_exchange_weak(T& expected, T desired,
 memory_order success, memory_order failure) const noexcept;
```

```
bool compare_exchange_strong(T& expected, T desired,
 memory_order success, memory_order failure) const noexcept;
```

```
bool compare_exchange_weak(T& expected, T desired,
 memory_order order = memory_order::seq_cst) const noexcept;
```

```
bool compare_exchange_strong(T& expected, T desired,
 memory_order order = memory_order::seq_cst) const noexcept;
```

15     *Preconditions:* failure is memory\_order::relaxed, memory\_order::consume, memory\_order::acquire, or memory\_order::seq\_cst.

16     *Effects:* Retrieves the value in expected. It then atomically compares the value representation of the value referenced by \*ptr for equality with that previously retrieved from expected, and if true, replaces the value referenced by \*ptr with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory\_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory\_order::acq\_rel shall be replaced by the value memory\_order::acquire and a value of memory\_order::release shall be replaced by the value memory\_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value read from the value referenced by \*ptr during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2) on the value referenced by \*ptr. Otherwise, these operations are atomic load operations on that memory.

17     *Returns:* The result of the comparison.

18     *Remarks:* A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and ptr are equal, it may return false and store back to expected the same memory contents that were originally there.

[Note 2: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — end note]

```
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

22     *Preconditions:* order is memory\_order::relaxed, memory\_order::consume, memory\_order::acquire, or memory\_order::seq\_cst.

23     *Effects:* Repeatedly performs the following steps, in order:

- (23.1) — Evaluates load(order) and compares its value representation for equality against that of old.
- (23.2) — If they compare unequal, returns.

(23.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

24 *Remarks:* This function is an atomic waiting operation (33.5.6) on atomic object \*ptr.

```
void notify_one() const noexcept;
```

25 *Effects:* Unblocks the execution of at least one atomic waiting operation on \*ptr that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

26 *Remarks:* This function is an atomic notifying operation (33.5.6) on atomic object \*ptr.

```
void notify_all() const noexcept;
```

27 *Effects:* Unblocks the execution of all atomic waiting operations on \*ptr that are eligible to be unblocked (33.5.6) by this call.

28 *Remarks:* This function is an atomic notifying operation (33.5.6) on atomic object \*ptr.

### 33.5.7.3 Specializations for integral types

[atomics.ref.int]

- <sup>1</sup> There are specializations of the `atomic_ref` class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the typedefs in the header `<cstdint>` (17.4.1). For each such type *integral-type*, the specialization `atomic_ref<integral-type>` provides additional atomic operations appropriate to integral types.

[*Note 1:* The specialization `atomic_ref<bool>` uses the primary template (33.5.7). — *end note*]

```
namespace std {
 template<> struct atomic_ref<integral-type> {
 private:
 integral-type* ptr; // exposition only

 public:
 using value_type = integral-type;
 using difference_type = value_type;
 static constexpr size_t required_alignment = implementation-defined;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const noexcept;

 explicit atomic_ref(integral-type&);
 atomic_ref(const atomic_ref&) noexcept;
 atomic_ref& operator=(const atomic_ref&) = delete;

 void store(integral-type, memory_order = memory_order::seq_cst) const noexcept;
 integral-type operator=(integral-type) const noexcept;
 integral-type load(memory_order = memory_order::seq_cst) const noexcept;
 operator integral-type() const noexcept;

 integral-type exchange(integral-type,
 memory_order = memory_order::seq_cst) const noexcept;
 bool compare_exchange_weak(integral-type&, integral-type,
 memory_order, memory_order) const noexcept;
 bool compare_exchange_strong(integral-type&, integral-type,
 memory_order, memory_order) const noexcept;
 bool compare_exchange_weak(integral-type&, integral-type,
 memory_order = memory_order::seq_cst) const noexcept;
 bool compare_exchange_strong(integral-type&, integral-type,
 memory_order = memory_order::seq_cst) const noexcept;

 integral-type fetch_add(integral-type,
 memory_order = memory_order::seq_cst) const noexcept;
 integral-type fetch_sub(integral-type,
 memory_order = memory_order::seq_cst) const noexcept;
 integral-type fetch_and(integral-type,
 memory_order = memory_order::seq_cst) const noexcept;
```

```

integral-type fetch_or(integral-type,
 memory_order = memory_order::seq_cst) const noexcept;
integral-type fetch_xor(integral-type,
 memory_order = memory_order::seq_cst) const noexcept;

integral-type operator++(int) const noexcept;
integral-type operator--(int) const noexcept;
integral-type operator++() const noexcept;
integral-type operator--() const noexcept;
integral-type operator+=(integral-type) const noexcept;
integral-type operator-=(integral-type) const noexcept;
integral-type operator&=(integral-type) const noexcept;
integral-type operator|=(integral-type) const noexcept;
integral-type operator^=(integral-type) const noexcept;

void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

}

```

- <sup>2</sup> Descriptions are provided below only for members that differ from the primary template.
- <sup>3</sup> The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 145](#).

```

integral-type fetch_key(integral-type operand,
 memory_order order = memory_order::seq_cst) const noexcept;

```

- <sup>4</sup> *Effects*: Atomically replaces the value referenced by *\*ptr* with the result of the computation applied to the value referenced by *\*ptr* and the given operand. Memory is affected according to the value of *order*. These operations are atomic read-modify-write operations ([6.9.2.2](#)).
- <sup>5</sup> *Returns*: Atomically, the value referenced by *\*ptr* immediately before the effects.
- <sup>6</sup> *Remarks*: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[*Note 2*: There are no undefined results arising from the computation. — *end note*]

```

integral-type operator op=(integral-type operand) const noexcept;

```

- <sup>7</sup> *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

### 33.5.7.4 Specializations for floating-point types

[**atomics.ref.float**]

- <sup>1</sup> There are specializations of the `atomic_ref` class template for all cv-unqualified floating-point types. For each such type *floating-point-type*, the specialization `atomic_ref<floating-point>` provides additional atomic operations appropriate to floating-point types.

```

namespace std {
 template<> struct atomic_ref<floating-point-type> {
private:
 floating-point-type* ptr; // exposition only

public:
 using value_type = floating-point-type;
 using difference_type = value_type;
 static constexpr size_t required_alignment = implementation-defined;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const noexcept;

 explicit atomic_ref(floating-point-type&);
 atomic_ref(const atomic_ref&) noexcept;
 atomic_ref& operator=(const atomic_ref&) = delete;
}

```

```

void store(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
floating-point-type operator=(floating-point-type) const noexcept;
floating-point-type load(memory_order = memory_order::seq_cst) const noexcept;
operator floating-point-type() const noexcept;

floating-point-type exchange(floating-point-type,
 memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_weak(floating-point-type&, floating-point-type,
 memory_order, memory_order) const noexcept;
bool compare_exchange_strong(floating-point-type&, floating-point-type,
 memory_order, memory_order) const noexcept;
bool compare_exchange_weak(floating-point-type&, floating-point-type,
 memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_strong(floating-point-type&, floating-point-type,
 memory_order = memory_order::seq_cst) const noexcept;

floating-point-type fetch_add(floating-point-type,
 memory_order = memory_order::seq_cst) const noexcept;
floating-point-type fetch_sub(floating-point-type,
 memory_order = memory_order::seq_cst) const noexcept;

floating-point-type operator+=(floating-point-type) const noexcept;
floating-point-type operator-=(floating-point-type) const noexcept;

void wait(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

}

```

<sup>2</sup> Descriptions are provided below only for members that differ from the primary template.

<sup>3</sup> The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 145](#).

```

floating-point-type fetch_key(floating-point-type operand,
 memory_order order = memory_order::seq_cst) const noexcept;

```

<sup>4</sup> *Effects*: Atomically replaces the value referenced by *\*ptr* with the result of the computation applied to the value referenced by *\*ptr* and the given operand. Memory is affected according to the value of *order*. These operations are atomic read-modify-write operations ([6.9.2.2](#)).

<sup>5</sup> *Returns*: Atomically, the value referenced by *\*ptr* immediately before the effects.

<sup>6</sup> *Remarks*: If the result is not a representable value for its type ([7.1](#)), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *floating-point-type* should conform to the `std::numeric_limits<floating-point-type>` traits associated with the floating-point type ([17.3.3](#)). The floating-point environment ([28.3](#)) for atomic arithmetic operations on *floating-point-type* may be different than the calling thread's floating-point environment.

```

floating-point-type operator op=(floating-point-type operand) const noexcept;

```

<sup>7</sup> *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

### 33.5.7.5 Partial specialization for pointers

[`atomics.ref.pointer`]

```

namespace std {
template<class T> struct atomic_ref<T*> {
private:
 T** ptr; // exposition only

public:
 using value_type = T*;
 using difference_type = ptrdiff_t;
 static constexpr size_t required_alignment = implementation-defined;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const noexcept;
}

```

```

explicit atomic_ref(T*&);

atomic_ref(const atomic_ref&) noexcept;
atomic_ref& operator=(const atomic_ref&) = delete;

void store(T*, memory_order = memory_order::seq_cst) const noexcept;
T* operator=(T*) const noexcept;
T* load(memory_order = memory_order::seq_cst) const noexcept;
operator T*() const noexcept;

T* exchange(T*, memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_weak(T*&, T*,
 memory_order, memory_order) const noexcept;
bool compare_exchange_strong(T*&, T*,
 memory_order, memory_order) const noexcept;
bool compare_exchange_weak(T*&, T*,
 memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_strong(T*&, T*,
 memory_order = memory_order::seq_cst) const noexcept;

T* fetch_add(difference_type, memory_order = memory_order::seq_cst) const noexcept;
T* fetch_sub(difference_type, memory_order = memory_order::seq_cst) const noexcept;

T* operator++(int) const noexcept;
T* operator--(int) const noexcept;
T* operator++() const noexcept;
T* operator--() const noexcept;
T* operator+=(difference_type) const noexcept;
T* operator-=(difference_type) const noexcept;

void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

}

```

- <sup>1</sup> Descriptions are provided below only for members that differ from the primary template.
- <sup>2</sup> The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 146](#).

- T\* *fetch\_key*(difference\_type *operand*, memory\_order *order* = memory\_order::seq\_cst) const noexcept;
- <sup>3</sup> *Mandates:* T is a complete object type.
  - <sup>4</sup> *Effects:* Atomically replaces the value referenced by *\*ptr* with the result of the computation applied to the value referenced by *\*ptr* and the given operand. Memory is affected according to the value of *order*. These operations are atomic read-modify-write operations ([6.9.2.2](#)).
  - <sup>5</sup> *Returns:* Atomically, the value referenced by *\*ptr* immediately before the effects.
  - <sup>6</sup> *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior.

- T\* operator *op*=(difference\_type *operand*) const noexcept;
- <sup>7</sup> *Effects:* Equivalent to: return *fetch\_key*(*operand*) *op* *operand*;

### 33.5.7.6 Member operators common to integers and pointers to objects [atomics.ref.memop]

- value\_type operator++(int) const noexcept;
- <sup>1</sup> *Effects:* Equivalent to: return *fetch\_add*(1);

value\_type operator--(int) const noexcept;

    - <sup>2</sup> *Effects:* Equivalent to: return *fetch\_sub*(1);

value\_type operator++() const noexcept;

      - <sup>3</sup> *Effects:* Equivalent to: return *fetch\_add*(1) + 1;

value\_type operator--() const noexcept;  
 4     *Effects:* Equivalent to: return fetch\_sub(1) - 1;

### 33.5.8 Class template atomic

[**atomics.types.generic**]

#### 33.5.8.1 General

[**atomics.types.generic.general**]

```
namespace std {
 template<class T> struct atomic {
 using value_type = T;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const volatile noexcept;
 bool is_lock_free() const noexcept;

 // 33.5.8.2, operations on atomic types
 constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
 constexpr atomic(T) noexcept;
 atomic(const atomic&) = delete;
 atomic& operator=(const atomic&) = delete;
 atomic& operator=(const atomic&) volatile = delete;

 T load(memory_order = memory_order::seq_cst) const volatile noexcept;
 T load(memory_order = memory_order::seq_cst) const noexcept;
 operator T() const volatile noexcept;
 operator T() const noexcept;
 void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
 void store(T, memory_order = memory_order::seq_cst) noexcept;
 T operator=(T) volatile noexcept;
 T operator=(T) noexcept;

 T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
 T exchange(T, memory_order = memory_order::seq_cst) noexcept;
 bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
 bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
 bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
 bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
 bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
 bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;
 bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
 bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;

 void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
 void wait(T, memory_order = memory_order::seq_cst) const noexcept;
 void notify_one() volatile noexcept;
 void notify_one() noexcept;
 void notify_all() volatile noexcept;
 void notify_all() noexcept;
 };
}
```

<sup>1</sup> The template argument for T shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. The program is ill-formed if any of

- (1.1) — *is\_trivially\_copyable\_v*<T>,
- (1.2) — *is\_copy\_constructible\_v*<T>,
- (1.3) — *is\_move\_constructible\_v*<T>,
- (1.4) — *is\_copy\_assignable\_v*<T>, or
- (1.5) — *is\_move\_assignable\_v*<T>

is false.

[*Note 1:* Type arguments that are not also statically initializable can be difficult to use. — *end note*]

- <sup>2</sup> The specialization `atomic<bool>` is a standard-layout struct.
- <sup>3</sup> [Note 2: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — end note]

### 33.5.8.2 Operations on atomic types

[`atomics.types.operations`]

```
constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);

1 Mandates: is_default_constructible_v<T> is true.

2 Effects: Initializes the atomic object with the value of T(). Initialization is not an atomic operation (6.9.2).

constexpr atomic(T desired) noexcept;

3 Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[Note 1: It is possible to have an access to an atomic object A race with its construction, for example by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

static constexpr bool is_always_lock_free = implementation-defined;

4 The static data member is_always_lock_free is true if the atomic type's operations are always lock-free, and false otherwise.

[Note 2: The value of is_always_lock_free is consistent with the value of the corresponding ATOMIC_..._LOCK_FREE macro, if defined. — end note]

bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;

5 Returns: true if the object's operations are lock-free, false otherwise.

[Note 3: The return value of the is_lock_free member function is consistent with the value of is_always_lock_free for the same type. — end note]

void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
void store(T desired, memory_order order = memory_order::seq_cst) noexcept;

6 Constraints: For the volatile overload of this function, is_always_lock_free is true.

7 Preconditions: order is memory_order::relaxed, memory_order::release, or memory_order::seq_cst.

8 Effects: Atomically replaces the value pointed to by this with the value of desired. Memory is affected according to the value of order.

T operator=(T desired) volatile noexcept;
T operator=(T desired) noexcept;

9 Constraints: For the volatile overload of this function, is_always_lock_free is true.

10 Effects: Equivalent to store(desired).

11 Returns: desired.

T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const noexcept;

12 Constraints: For the volatile overload of this function, is_always_lock_free is true.

13 Preconditions: order is memory_order::relaxed, memory_order::consume, memory_order::acquire, or memory_order::seq_cst.

14 Effects: Memory is affected according to the value of order.

15 Returns: Atomically returns the value pointed to by this.

operator T() const volatile noexcept;
operator T() const noexcept;

16 Constraints: For the volatile overload of this function, is_always_lock_free is true.

17 Effects: Equivalent to: return load();
```

```

T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;

18 Constraints: For the volatile overload of this function, is_always_lock_free is true.

19 Effects: Atomically replaces the value pointed to by this with desired. Memory is affected according
 to the value of order. These operations are atomic read-modify-write operations (6.9.2).

20 Returns: Atomically returns the value pointed to by this immediately before the effects.

bool compare_exchange_weak(T& expected, T desired,
 memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order order = memory_order::seq_cst) noexcept;

21 Constraints: For the volatile overload of this function, is_always_lock_free is true.

22 Preconditions: failure is memory_order::relaxed, memory_order::consume, memory_order::acquire, or memory_order::seq_cst.

23 Effects: Retrieves the value in expected. It then atomically compares the value representation of
 the value pointed to by this for equality with that previously retrieved from expected, and if true,
 replaces the value pointed to by this with that in desired. If and only if the comparison is true,
 memory is affected according to the value of success, and if the comparison is false, memory is affected
 according to the value of failure. When only one memory_order argument is supplied, the value of
 success is order, and the value of failure is order except that a value of memory_order::acq_rel
 shall be replaced by the value memory_order::acquire and a value of memory_order::release shall
 be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after
 the atomic operation, the value in expected is replaced by the value pointed to by this during the
 atomic comparison. If the operation returns true, these operations are atomic read-modify-write
 operations (6.9.2) on the memory pointed to by this. Otherwise, these operations are atomic load
 operations on that memory.

24 Returns: The result of the comparison.

25 [Note 4: For example, the effect of compare_exchange_strong on objects without padding bits (6.8.1) is

```

if (memcmp(this, &expected, sizeof(*this)) == 0)
    memcpy(this, &desired, sizeof(*this));
else
    memcpy(&expected, this, sizeof(*this));
— end note]
```

 [Example 1: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange
 operations will update expected when another iteration of the loop is needed.

```

expected = current.load();
do {
    desired = function(expected);
} while (!current.compare_exchange_weak(expected, desired));
— end example]
```

 [Example 2: Because the expected value is updated only on failure, code releasing the memory containing
 the expected value on success will work. For example, list head insertion will act atomically and would not
 introduce a data race in the following code:

```

// Example code showing atomic list insertion
list_head = current.load();
do {
    desired = function(list_head);
} while (!current.compare_exchange_weak(list_head, desired));
list_head = desired;
// list_head now contains the new value, and the old value is released
```

]

```

```

do {
 p->next = head; // make new list node point to the current head
} while (!head.compare_exchange_weak(p->next, p)); // try to insert
— end example]

```

26 Implementations should ensure that weak compare-and-exchange operations do not consistently return `false` unless either the atomic object has value different from `expected` or there are concurrent modifications to the atomic object.

27 *Remarks:* A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by `expected` and `this` are equal, it may return `false` and store back to `expected` the same memory contents that were originally there.

[*Note 5:* This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — end note]

28 [Note 6: Under cases where the `memcpy` and `memcmp` semantics of the compare-and-exchange operations apply, the comparisons can fail for values that compare equal with `operator==` if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC/IEEE 60559, floating-point `-0.0` and `+0.0` will not compare equal with `memcmp` but will compare equal with `operator==`, and NaNs with the same payload will compare equal with `memcmp` but will not compare equal with `operator==`. — end note]

[*Note 7:* Because compare-and-exchange acts on an object's value representation, padding bits that never participate in the object's value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:

```

struct padded {
 char clank = 0x42;
 // Padding here.
 unsigned biff = 0xC0DEFEFE;
};

atomic<padded> pad = {};

bool zap() {
 padded expected, desired{0, 0};
 return pad.compare_exchange_strong(expected, desired);
}
— end note]

```

[*Note 8:* For a union with bits that participate in the value representation of some members but not others, compare-and-exchange might always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

```

union pony {
 double celestia = 0.;
 short luna; // padded
};

atomic<pony> princesses = {};

bool party(pony desired) {
 pony expected;
 return princesses.compare_exchange_strong(expected, desired);
}
— end note]

```

```

void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;

```

29 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::consume`, `memory_order::acquire`, or `memory_order::seq_cst`.

30 *Effects:* Repeatedly performs the following steps, in order:

- (30.1) — Evaluates `load(order)` and compares its value representation for equality against that of `old`.

- (30.2) — If they compare unequal, returns.  
 (30.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.
- 31    *Remarks:* This function is an atomic waiting operation (33.5.6).

```
void notify_one() volatile noexcept;
void notify_one() noexcept;
```

- 32    *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.
- 33    *Remarks:* This function is an atomic notifying operation (33.5.6).

```
void notify_all() volatile noexcept;
void notify_all() noexcept;
```

- 34    *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.
- 35    *Remarks:* This function is an atomic notifying operation (33.5.6).

### 33.5.8.3 Specializations for integers

[atomics.types.int]

- <sup>1</sup> There are specializations of the `atomic` class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the `typedefs` in the header `<cstdint>` (17.4.1). For each such type *integral-type*, the specialization `atomic<integral-type>` provides additional atomic operations appropriate to integral types.

[*Note 1:* The specialization `atomic<bool>` uses the primary template (33.5.8). — *end note*]

```
namespace std {
 template<> struct atomic<integral-type> {
 using value_type = integral-type;
 using difference_type = value_type;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const volatile noexcept;
 bool is_lock_free() const noexcept;

 constexpr atomic() noexcept;
 constexpr atomic(integral-type) noexcept;
 atomic(const atomic&) = delete;
 atomic& operator=(const atomic&) = delete;
 atomic& operator=(const atomic&) volatile = delete;

 void store(integral-type, memory_order = memory_order::seq_cst) volatile noexcept;
 void store(integral-type, memory_order = memory_order::seq_cst) noexcept;
 integral-type operator=(integral-type) volatile noexcept;
 integral-type operator=(integral-type) noexcept;
 integral-type load(memory_order = memory_order::seq_cst) const volatile noexcept;
 integral-type load(memory_order = memory_order::seq_cst) const noexcept;
 operator integral-type() const volatile noexcept;
 operator integral-type() const noexcept;

 integral-type exchange(integral-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 integral-type exchange(integral-type,
 memory_order = memory_order::seq_cst) noexcept;
 bool compare_exchange_weak(integral-type&, integral-type,
 memory_order, memory_order) volatile noexcept;
 bool compare_exchange_weak(integral-type&, integral-type,
 memory_order, memory_order) noexcept;
 bool compare_exchange_strong(integral-type&, integral-type,
 memory_order, memory_order) volatile noexcept;
 bool compare_exchange_strong(integral-type&, integral-type,
 memory_order, memory_order) noexcept;
 };
}
```

```

 bool compare_exchange_weak(integral-type&, integral-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 bool compare_exchange_weak(integral-type&, integral-type,
 memory_order = memory_order::seq_cst) noexcept;
 bool compare_exchange_strong(integral-type&, integral-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 bool compare_exchange_strong(integral-type&, integral-type,
 memory_order = memory_order::seq_cst) noexcept;

 integral-type fetch_add(integral-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 integral-type fetch_add(integral-type,
 memory_order = memory_order::seq_cst) noexcept;
 integral-type fetch_sub(integral-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 integral-type fetch_sub(integral-type,
 memory_order = memory_order::seq_cst) noexcept;
 integral-type fetch_and(integral-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 integral-type fetch_and(integral-type,
 memory_order = memory_order::seq_cst) noexcept;
 integral-type fetch_or(integral-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 integral-type fetch_or(integral-type,
 memory_order = memory_order::seq_cst) noexcept;
 integral-type fetch_xor(integral-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 integral-type fetch_xor(integral-type,
 memory_order = memory_order::seq_cst) noexcept;

 integral-type operator++(int) volatile noexcept;
 integral-type operator++(int) noexcept;
 integral-type operator--(int) volatile noexcept;
 integral-type operator--(int) noexcept;
 integral-type operator++() volatile noexcept;
 integral-type operator++() noexcept;
 integral-type operator--() volatile noexcept;
 integral-type operator--() noexcept;
 integral-type operator+=(integral-type) volatile noexcept;
 integral-type operator+=(integral-type) noexcept;
 integral-type operator-=(integral-type) volatile noexcept;
 integral-type operator-=(integral-type) noexcept;
 integral-type operator&=(integral-type) volatile noexcept;
 integral-type operator&=(integral-type) noexcept;
 integral-type operator|=(integral-type) volatile noexcept;
 integral-type operator|=(integral-type) noexcept;
 integral-type operator^=(integral-type) volatile noexcept;
 integral-type operator^=(integral-type) noexcept;

 void wait(integral-type, memory_order = memory_order::seq_cst) const volatile noexcept;
 void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;
 void notify_one() volatile noexcept;
 void notify_one() noexcept;
 void notify_all() volatile noexcept;
 void notify_all() noexcept;
 };
}

```

<sup>2</sup> The atomic integral specializations are standard-layout structs. They each have a trivial destructor.

<sup>3</sup> Descriptions are provided below only for members that differ from the primary template.

<sup>4</sup> The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 145](#).

**Table 145 — Atomic arithmetic computations** [tab:atomic.types.int.comp]

| <b>key</b> | <b>Op</b> | <b>Computation</b>   | <b>key</b> | <b>Op</b> | <b>Computation</b>   |
|------------|-----------|----------------------|------------|-----------|----------------------|
| add        | +         | addition             | sub        | -         | subtraction          |
| or         |           | bitwise inclusive or | xor        | ^         | bitwise exclusive or |
| and        | &         | bitwise and          |            |           |                      |

T `fetch_key(T operand, memory_order order = memory_order::seq_cst)` volatile noexcept;  
T `fetch_key(T operand, memory_order order = memory_order::seq_cst)` noexcept;

- 5     *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.  
6     *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied  
       to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of  
       `order`. These operations are atomic read-modify-write operations (6.9.2).  
7     *Returns:* Atomically, the value pointed to by `this` immediately before the effects.  
8     *Remarks:* For signed integer types, the result is as if the object value and parameters were converted to  
       their corresponding unsigned types, the computation performed on those types, and the result converted  
       back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]

T `operator op=(T operand) volatile noexcept;`  
T `operator op=(T operand) noexcept;`

- 9     *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.  
10    *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

### 33.5.8.4 Specializations for floating-point types

[atomics.types.float]

- 1 There are specializations of the `atomic` class template for all cv-unqualified floating-point types. For each such type `floating-point-type`, the specialization `atomic<floating-point-type>` provides additional atomic operations appropriate to floating-point types.

```
namespace std {
 template<> struct atomic<floating-point-type> {
 using value_type = floating-point-type;
 using difference_type = value_type;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const volatile noexcept;
 bool is_lock_free() const noexcept;

 constexpr atomic() noexcept;
 constexpr atomic(floating-point-type) noexcept;
 atomic(const atomic&) = delete;
 atomic& operator=(const atomic&) = delete;
 atomic& operator=(const atomic&) volatile = delete;

 void store(floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
 void store(floating-point-type, memory_order = memory_order::seq_cst) noexcept;
 floating-point-type operator=(floating-point-type) volatile noexcept;
 floating-point-type operator=(floating-point-type) noexcept;
 floating-point-type load(memory_order = memory_order::seq_cst) volatile noexcept;
 floating-point-type load(memory_order = memory_order::seq_cst) noexcept;
 operator floating-point-type() volatile noexcept;
 operator floating-point-type() noexcept;

 floating-point-type exchange(floating-point-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 floating-point-type exchange(floating-point-type,
 memory_order = memory_order::seq_cst) noexcept;
```

```

 bool compare_exchange_weak(floating-point-type&, floating-point-type,
 memory_order, memory_order) volatile noexcept;
 bool compare_exchange_weak(floating-point-type&, floating-point-type,
 memory_order, memory_order) noexcept;
 bool compare_exchange_strong(floating-point-type&, floating-point-type,
 memory_order, memory_order) volatile noexcept;
 bool compare_exchange_strong(floating-point-type&, floating-point-type,
 memory_order, memory_order) noexcept;
 bool compare_exchange_weak(floating-point-type&, floating-point-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 bool compare_exchange_weak(floating-point-type&, floating-point-type,
 memory_order = memory_order::seq_cst) noexcept;
 bool compare_exchange_strong(floating-point-type&, floating-point-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 bool compare_exchange_strong(floating-point-type&, floating-point-type,
 memory_order = memory_order::seq_cst) noexcept;

 floating-point-type fetch_add(floating-point-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 floating-point-type fetch_add(floating-point-type,
 memory_order = memory_order::seq_cst) noexcept;
 floating-point-type fetch_sub(floating-point-type,
 memory_order = memory_order::seq_cst) volatile noexcept;
 floating-point-type fetch_sub(floating-point-type,
 memory_order = memory_order::seq_cst) noexcept;

 floating-point-type operator+=(floating-point-type) volatile noexcept;
 floating-point-type operator+=(floating-point-type) noexcept;
 floating-point-type operator-=(floating-point-type) volatile noexcept;
 floating-point-type operator-=(floating-point-type) noexcept;

 void wait(floating-point-type, memory_order = memory_order::seq_cst) const volatile noexcept;
 void wait(floating-point-type, memory_order = memory_order::seq_cst) const noexcept;
 void notify_one() volatile noexcept;
 void notify_one() noexcept;
 void notify_all() volatile noexcept;
 void notify_all() noexcept;
 };
}

```

<sup>2</sup> The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.

<sup>3</sup> Descriptions are provided below only for members that differ from the primary template.

<sup>4</sup> The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in [Table 145](#).

T fetch\_key(T operand, memory\_order order = memory\_order::seq\_cst) volatile noexcept;  
T fetch\_key(T operand, memory\_order order = memory\_order::seq\_cst) noexcept;

<sup>5</sup> *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

<sup>6</sup> *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.9.2](#)).

<sup>7</sup> *Returns:* Atomically, the value pointed to by `this` immediately before the effects.

<sup>8</sup> *Remarks:* If the result is not a representable value for its type ([7.1](#)) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on `floating-point-type` should conform to the `std::numeric_limits<floating-point-type>` traits associated with the floating-point type ([17.3.3](#)). The floating-point environment ([28.3](#)) for atomic arithmetic operations on `floating-point-type` may be different than the calling thread's floating-point environment.

T operator op=(T operand) volatile noexcept;  
T operator op=(T operand) noexcept;

<sup>9</sup> *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

10     *Effects:* Equivalent to: `return fetch_key(operand) op operand;`  
 11     *Remarks:* If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *floating-point-type* should conform to the `std::numeric_limits<floating-point-type>` traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on *floating-point-type* may be different than the calling thread's floating-point environment.

### 33.5.8.5 Partial specialization for pointers

[`atomics.types.pointer`]

```
namespace std {
 template<class T> struct atomic<T*> {
 using value_type = T*;
 using difference_type = ptrdiff_t;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const volatile noexcept;
 bool is_lock_free() const noexcept;

 constexpr atomic() noexcept;
 constexpr atomic(T*) noexcept;
 atomic(const atomic&) = delete;
 atomic& operator=(const atomic&) = delete;
 atomic& operator=(const atomic&) volatile = delete;

 void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
 void store(T*, memory_order = memory_order::seq_cst) noexcept;
 T* operator=(T*) volatile noexcept;
 T* operator=(T*) noexcept;
 T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
 T* load(memory_order = memory_order::seq_cst) const noexcept;
 operator T*() const volatile noexcept;
 operator T*() const noexcept;

 T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
 T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
 bool compare_exchange_weak(T*&, T*, memory_order, memory_order) volatile noexcept;
 bool compare_exchange_weak(T*&, T*, memory_order, memory_order) noexcept;
 bool compare_exchange_strong(T*&, T*, memory_order, memory_order) volatile noexcept;
 bool compare_exchange_strong(T*&, T*, memory_order, memory_order) noexcept;
 bool compare_exchange_weak(T*&, T*,
 memory_order = memory_order::seq_cst) volatile noexcept;
 bool compare_exchange_weak(T*&, T*,
 memory_order = memory_order::seq_cst) noexcept;
 bool compare_exchange_strong(T*&, T*,
 memory_order = memory_order::seq_cst) volatile noexcept;
 bool compare_exchange_strong(T*&, T*,
 memory_order = memory_order::seq_cst) noexcept;

 T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
 T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
 T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
 T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;

 T* operator++(int) volatile noexcept;
 T* operator++(int) noexcept;
 T* operator--(int) volatile noexcept;
 T* operator--(int) noexcept;
 T* operator++() volatile noexcept;
 T* operator++() noexcept;
 T* operator--() volatile noexcept;
 T* operator--() noexcept;
 T* operator+=(ptrdiff_t) volatile noexcept;
 T* operator+=(ptrdiff_t) noexcept;
 T* operator-=(ptrdiff_t) volatile noexcept;
```

```

T* operator--(ptrdiff_t) noexcept;

void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

}

```

- <sup>1</sup> There is a partial specialization of the `atomic` class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.
- <sup>2</sup> Descriptions are provided below only for members that differ from the primary template.
- <sup>3</sup> The following operations perform pointer arithmetic. The correspondence among key, operator, and computation is specified in [Table 146](#).

**Table 146 — Atomic pointer computations** [tab:atomic.types.pointer.comp]

| key | Op | Computation | key | Op | Computation |
|-----|----|-------------|-----|----|-------------|
| add | +  | addition    | sub | -  | subtraction |

```

T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;

4 Constraints: For the volatile overload of this function, is_always_lock_free is true.

5 Mandates: T is a complete object type.

[Note 1: Pointer arithmetic on void* or function pointers is ill-formed. — end note]

6 Effects: Atomically replaces the value pointed to by this with the result of the computation applied
 to the value pointed to by this and the given operand. Memory is affected according to the value of
 order. These operations are atomic read-modify-write operations (6.9.2).

7 Returns: Atomically, the value pointed to by this immediately before the effects.

8 Remarks: The result may be an undefined address, but the operations otherwise have no undefined
 behavior.

T* operator op=(ptrdiff_t operand) volatile noexcept;
T* operator op=(ptrdiff_t operand) noexcept;

9 Constraints: For the volatile overload of this function, is_always_lock_free is true.

10 Effects: Equivalent to: return fetch_key(operand) op operand;

```

### 33.5.8.6 Member operators common to integers and pointers to objects[atomics.types.memop]

```

value_type operator++(int) volatile noexcept;
value_type operator++(int) noexcept;

1 Constraints: For the volatile overload of this function, is_always_lock_free is true.

2 Effects: Equivalent to: return fetch_add(1);

value_type operator--(int) volatile noexcept;
value_type operator--(int) noexcept;

3 Constraints: For the volatile overload of this function, is_always_lock_free is true.

4 Effects: Equivalent to: return fetch_sub(1);

value_type operator++() volatile noexcept;
value_type operator++() noexcept;

5 Constraints: For the volatile overload of this function, is_always_lock_free is true.

6 Effects: Equivalent to: return fetch_add(1) + 1;

```

```
value_type operator--() volatile noexcept;
value_type operator--() noexcept;
```

7     *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is true.

8     *Effects:* Equivalent to: `return fetch_sub(1) - 1;`

### 33.5.8.7 Partial specializations for smart pointers

[`util.smartptr.atomic`]

#### 33.5.8.7.1 General

[`util.smartptr.atomic.general`]

<sup>1</sup> The library provides partial specializations of the `atomic` template for shared-ownership smart pointers ([20.3.2](#)).

[*Note 1:* The partial specializations are declared in header `<memory>` ([20.2.2](#)). — *end note*]

The behavior of all operations is as specified in [33.5.8](#), unless specified otherwise. The template parameter `T` of these partial specializations may be an incomplete type.

<sup>2</sup> All changes to an atomic smart pointer in [33.5.8.7](#), and all associated `use_count` increments, are guaranteed to be performed atomically. Associated `use_count` decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

[*Note 2:* If the atomic operation uses locks, locks acquired by the implementation will be held when any `use_count` adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed. — *end note*]

3     *[Example 1:*

```
template<typename T> class atomic_list {
 struct node {
 T t;
 shared_ptr<node> next;
 };
 atomic<shared_ptr<node>> head;

public:
 shared_ptr<node> find(T t) const {
 auto p = head.load();
 while (p && p->t != t)
 p = p->next;

 return p;
 }

 void push_front(T t) {
 auto p = make_shared<node>();
 p->t = t;
 p->next = head;
 while (!head.compare_exchange_weak(p->next, p)) {}
 }
};
```

*— end example*]

#### 33.5.8.7.2 Partial specialization for `shared_ptr`

[`util.smartptr.atomic.shared`]

```
namespace std {
 template<class T> struct atomic<shared_ptr<T>> {
 using value_type = shared_ptr<T>;

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const noexcept;

 constexpr atomic() noexcept;
 constexpr atomic(nullptr_t) noexcept : atomic() { }
 atomic(shared_ptr<T> desired) noexcept;
 atomic(const atomic&) = delete;
 void operator=(const atomic&) = delete;
```

```

shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
operator shared_ptr<T>() const noexcept;
void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
void operator=(shared_ptr<T> desired) noexcept;
void operator=(nullptr_t) noexcept;

shared_ptr<T> exchange(shared_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
 memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
 memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;

void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
void notify_one() noexcept;
void notify_all() noexcept;

private:
 shared_ptr<T> p; // exposition only
};

constexpr atomic() noexcept;

```

1      *Effects:* Initializes p{}.

atomic(shared\_ptr<T> desired) noexcept;

2      *Effects:* Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[*Note 1:* It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — *end note*]

void store(shared\_ptr<T> desired, memory\_order order = memory\_order::seq\_cst) noexcept;

3      *Preconditions:* order is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

4      *Effects:* Atomically replaces the value pointed to by this with the value of desired as if by `p.swap(desired)`. Memory is affected according to the value of order.

void operator=(shared\_ptr<T> desired) noexcept;

5      *Effects:* Equivalent to `store(desired)`.

void operator=(nullptr\_t) noexcept;

6      *Effects:* Equivalent to `store(nullptr)`.

shared\_ptr<T> load(memory\_order order = memory\_order::seq\_cst) const noexcept;

7      *Preconditions:* order is `memory_order::relaxed`, `memory_order::consume`, `memory_order::acquire`, or `memory_order::seq_cst`.

8      *Effects:* Memory is affected according to the value of order.

9      *Returns:* Atomically returns p.

operator shared\_ptr<T>() const noexcept;

10     *Effects:* Equivalent to: `return load();`

```
shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

11     *Effects:* Atomically replaces `p` with `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`. This is an atomic read-modify-write operation (6.9.2.2).

12     *Returns:* Atomically returns the value of `p` immediately before the effects.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
 memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
 memory_order success, memory_order failure) noexcept;
```

13     *Preconditions:* `failure` is `memory_order::relaxed`, `memory_order::consume`, `memory_order::acquire`, or `memory_order::seq_cst`.

14     *Effects:* If `p` is equivalent to `expected`, assigns `desired` to `p` and has synchronization semantics corresponding to the value of `success`, otherwise assigns `p` to `expected` and has synchronization semantics corresponding to the value of `failure`.

15     *Returns:* `true` if `p` was equivalent to `expected`, `false` otherwise.

16     *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

17     If the operation returns `true`, `expected` is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by `this`. Otherwise, the operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;
```

18     *Effects:* Equivalent to:

```
 return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;
```

19     *Effects:* Equivalent to:

```
 return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

20     *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::consume`, `memory_order::acquire`, or `memory_order::seq_cst`.

21     *Effects:* Repeatedly performs the following steps, in order:

- (21.1) — Evaluates `load(order)` and compares it to `old`.
- (21.2) — If the two are not equivalent, returns.
- (21.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

22     *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

```
void notify_one() noexcept;
```

23     *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

24        *Remarks:* This function is an atomic notifying operation (33.5.6).

void notify\_all() noexcept;

25        *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

26        *Remarks:* This function is an atomic notifying operation (33.5.6).

### 33.5.8.7.3 Partial specialization for `weak_ptr`

[`util.smartptr.atomic.weak`]

```
namespace std {
 template<class T> struct atomic<weak_ptr<T>> {
 using value_type = weak_ptr<T>

 static constexpr bool is_always_lock_free = implementation-defined;
 bool is_lock_free() const noexcept;

 constexpr atomic() noexcept;
 atomic(weak_ptr<T> desired) noexcept;
 atomic(const atomic&) = delete;
 void operator=(const atomic&) = delete;

 weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
 operator weak_ptr<T>() const noexcept;
 void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
 void operator=(weak_ptr<T> desired) noexcept;

 weak_ptr<T> exchange(weak_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;
 bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
 memory_order success, memory_order failure) noexcept;
 bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
 memory_order success, memory_order failure) noexcept;
 bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;
 bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;

 void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
 void notify_one() noexcept;
 void notify_all() noexcept;

 private:
 weak_ptr<T> p; // exposition only
 };
}
```

constexpr atomic() noexcept;

1        *Effects:* Initializes `p{}`.

atomic(weak\_ptr<T> desired) noexcept;

2        *Effects:* Initializes the object with the value `desired`. Initialization is not an atomic operation (6.9.2).

[*Note 1:* It is possible to have an access to an atomic object `A` race with its construction, for example, by communicating the address of the just-constructed object `A` to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing `A` in the receiving thread. This results in undefined behavior. — *end note*]

void store(weak\_ptr<T> desired, memory\_order order = memory\_order::seq\_cst) noexcept;

3        *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

4        *Effects:* Atomically replaces the value pointed to by `this` with the value of `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`.

```

void operator=(weak_ptr<T> desired) noexcept;
5 Effects: Equivalent to store(desired).

weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
6 Preconditions: order is memory_order::relaxed, memory_order::consume, memory_order::ac-
 quire, or memory_order::seq_cst.
7 Effects: Memory is affected according to the value of order.
8 Returns: Atomically returns p.

operator weak_ptr<T>() const noexcept;
9 Effects: Equivalent to: return load();

weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
10 Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according
 to the value of order. This is an atomic read-modify-write operation (6.9.2.2).
11 Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
 memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
 memory_order success, memory_order failure) noexcept;
12 Preconditions: failure is memory_order::relaxed, memory_order::consume, memory_order::ac-
 quire, or memory_order::seq_cst.
13 Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics
 corresponding to the value of success, otherwise assigns p to expected and has synchronization
 semantics corresponding to the value of failure.
14 Returns: true if p was equivalent to expected, false otherwise.
15 Remarks: Two weak_ptr objects are equivalent if they store the same pointer value and either share
 ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.
16 If the operation returns true, expected is not accessed after the atomic update and the operation
 is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the
 operation is an atomic load operation on that memory, and expected is updated with the existing value
 read from the atomic object in the attempted atomic update. The use_count update corresponding to
 the write to expected is part of the atomic operation. The write to expected itself is not required to
 be part of the atomic operation.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;
17 Effects: Equivalent to:
 return compare_exchange_weak(expected, desired, order, fail_order);
where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced
by the value memory_order::acquire and a value of memory_order::release shall be replaced by
the value memory_order::relaxed.

bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
 memory_order order = memory_order::seq_cst) noexcept;
18 Effects: Equivalent to:
 return compare_exchange_strong(expected, desired, order, fail_order);
where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced
by the value memory_order::acquire and a value of memory_order::release shall be replaced by
the value memory_order::relaxed.

void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
19 Preconditions: order is memory_order::relaxed, memory_order::consume, memory_order::ac-
 quire, or memory_order::seq_cst.

```

- 20     *Effects:* Repeatedly performs the following steps, in order:  
 (20.1) — Evaluates `load(order)` and compares it to `old`.  
 (20.2) — If the two are not equivalent, returns.  
 (20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.
- 21     *Remarks:* Two `weak_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

```
void notify_one() noexcept;
```

- 22     *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

- 23     *Remarks:* This function is an atomic notifying operation (33.5.6).

```
void notify_all() noexcept;
```

- 24     *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

- 25     *Remarks:* This function is an atomic notifying operation (33.5.6).

### 33.5.9 Non-member functions

[**atomics.nonmembers**]

- 1 A non-member function template whose name matches the pattern `atomic_f` or the pattern `atomic_f_-explicit` invokes the member function `f`, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An argument for a parameter of type `atomic<T>::value_type*` is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.
- 2 [Note 1: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file. — end note]

### 33.5.10 Flag type and operations

[**atomics.flag**]

```
namespace std {
 struct atomic_flag {
 constexpr atomic_flag() noexcept;
 atomic_flag(const atomic_flag&) = delete;
 atomic_flag& operator=(const atomic_flag&) = delete;
 atomic_flag& operator=(const atomic_flag&) volatile = delete;

 bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
 bool test(memory_order = memory_order::seq_cst) const noexcept;
 bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
 bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
 void clear(memory_order = memory_order::seq_cst) volatile noexcept;
 void clear(memory_order = memory_order::seq_cst) noexcept;

 void wait(bool, memory_order = memory_order::seq_cst) const volatile noexcept;
 void wait(bool, memory_order = memory_order::seq_cst) const noexcept;
 void notify_one() volatile noexcept;
 void notify_one() noexcept;
 void notify_all() volatile noexcept;
 void notify_all() noexcept;
 };
}
```

- 1 The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.
- 2 Operations on an object of type `atomic_flag` shall be lock-free. The operations should also be address-free.
- 3 The `atomic_flag` type is a standard-layout struct. It has a trivial destructor.

```
constexpr atomic_flag::atomic_flag() noexcept;
```

- 4     *Effects:* Initializes `*this` to the clear state.

```

bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object,
 memory_order order) noexcept;
bool atomic_flag_test_explicit(const atomic_flag* object,
 memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;

5 For atomic_flag_test, let order be memory_order::seq_cst.

6 Preconditions: order is memory_order::relaxed, memory_order::consume, memory_order::ac-
 quire, or memory_order::seq_cst.

7 Effects: Memory is affected according to the value of order.

8 Returns: Atomically returns the value pointed to by object or this.

```

```

bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;

9 Effects: Atomically sets the value pointed to by object or by this to true. Memory is affected
 according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

10 Returns: Atomically, the value of the object immediately before the effects.

```

```

void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;

11 Preconditions: order is memory_order::relaxed, memory_order::release, or memory_order::seq-
 cst.

12 Effects: Atomically sets the value pointed to by object or by this to false. Memory is affected
 according to the value of order.

```

```

void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object,
 bool old, memory_order order) noexcept;
void atomic_flag_wait_explicit(const atomic_flag* object,
 bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order =
 memory_order::seq_cst) const volatile noexcept;
void atomic_flag::wait(bool old, memory_order order =
 memory_order::seq_cst) const noexcept;

```

```

13 For atomic_flag_wait, let order be memory_order::seq_cst. Let flag be object for the non-
 member functions and this for the member functions.

14 Preconditions: order is memory_order::relaxed, memory_order::consume, memory_order::ac-
 quire, or memory_order::seq_cst.

15 Effects: Repeatedly performs the following steps, in order:
 — Evaluates flag->test(order) != old.
 — If the result of that evaluation is true, returns.
 — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

16 Remarks: This function is an atomic waiting operation (33.5.6).

```

```

void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_one(atomic_flag* object) noexcept;

```

```
void atomic_flag::notify_one() volatile noexcept;
void atomic_flag::notify_one() noexcept;
```

17     *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

18     *Remarks:* This function is an atomic notifying operation (33.5.6).

```
void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
void atomic_flag::notify_all() noexcept;
```

19     *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

20     *Remarks:* This function is an atomic notifying operation (33.5.6).

```
#define ATOMIC_FLAG_INIT see below
```

21     *Remarks:* The macro ATOMIC\_FLAG\_INIT is defined in such a way that it can be used to initialize an object of type `atomic_flag` to the clear state. The macro can be used in the form:

```
atomic_flag guard = ATOMIC_FLAG_INIT;
```

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.

### 33.5.11 Fences

[**atomics.fences**]

- 1 This subclause introduces synchronization primitives called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an *acquire fence*. A fence with release semantics is called a *release fence*.
- 2 A release fence *A* synchronizes with an acquire fence *B* if there exist atomic operations *X* and *Y*, both operating on some atomic object *M*, such that *A* is sequenced before *X*, *X* modifies *M*, *Y* is sequenced before *B*, and *Y* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- 3 A release fence *A* synchronizes with an atomic operation *B* that performs an acquire operation on an atomic object *M* if there exists an atomic operation *X* such that *A* is sequenced before *X*, *X* modifies *M*, and *B* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.
- 4 An atomic operation *A* that is a release operation on an atomic object *M* synchronizes with an acquire fence *B* if there exists some atomic operation *X* on *M* such that *X* is sequenced before *B* and reads the value written by *A* or a value written by any side effect in the release sequence headed by *A*.

```
extern "C" void atomic_thread_fence(memory_order order) noexcept;
```

5     *Effects:* Depending on the value of `order`, this operation:

- (5.1)     — has no effects, if `order == memory_order::relaxed`;
- (5.2)     — is an acquire fence, if `order == memory_order::acquire` or `order == memory_order::consume`;
- (5.3)     — is a release fence, if `order == memory_order::release`;
- (5.4)     — is both an acquire fence and a release fence, if `order == memory_order::acq_rel`;
- (5.5)     — is a sequentially consistent acquire and release fence, if `order == memory_order::seq_cst`.

```
extern "C" void atomic_signal_fence(memory_order order) noexcept;
```

6     *Effects:* Equivalent to `atomic_thread_fence(order)`, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

7     [*Note 1:* `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted. — *end note*]

### 33.5.12 C compatibility

The header <stdatomic.h> provides the following definitions:

```
template<class T>
using std::atomic = std::atomic<T>; // exposition only

#define _Atomic(T) std::atomic<T>

#define ATOMIC_BOOL_LOCK_FREE see below
#define ATOMIC_CHAR_LOCK_FREE see below

#define ATOMIC_FLAG_INIT see below

using std::atomic_thread_fence; // see below
using std::atomic_signal_fence; // see below

```

- <sup>1</sup> Each *using-declaration* for some name *A* in the synopsis above makes available the same entity as `std::A` declared in `<atomic>` (33.5.2). Each macro listed above other than `_Atomic(T)` is defined as in `<atomic>`. It is unspecified whether `<stdatomic.h>` makes available any declarations in namespace `std`.
- <sup>2</sup> Each of the *using-declarations* for `intN_t`, `uintN_t`, `intptr_t`, and `uintptr_t` listed above is defined if and only if the implementation defines the corresponding *typedef-name* in 33.5.2.
- <sup>3</sup> Neither the `_Atomic` macro, nor any of the non-macro global namespace declarations, are provided by any C++ standard library header other than `<stdatomic.h>`.
- <sup>4</sup> *Recommended practice:* Implementations should ensure that C and C++ representations of atomic objects are compatible, so that the same object can be accessed as both an `_Atomic(T)` from C code and an `atomic<T>` from C++ code. The representations should be the same, and the mechanisms used to ensure atomicity and memory ordering should be compatible.

## 33.6 Mutual exclusion

[**thread.mutex**]

### 33.6.1 General

[**thread.mutex.general**]

- <sup>1</sup> Subclause 33.6 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

### 33.6.2 Header <mutex> synopsis

[**mutex.syn**]

```

namespace std {
 // 33.6.4.2.2, class mutex
 class mutex;
 // 33.6.4.2.3, class recursive_mutex
 class recursive_mutex;
 // 33.6.4.3.2 class timed_mutex
 class timed_mutex;
 // 33.6.4.3.3, class recursive_timed_mutex
 class recursive_timed_mutex;

 struct defer_lock_t { explicit defer_lock_t() = default; };
 struct try_to_lock_t { explicit try_to_lock_t() = default; };
 struct adopt_lock_t { explicit adopt_lock_t() = default; };

 inline constexpr defer_lock_t defer_lock { };
 inline constexpr try_to_lock_t try_to_lock { };
 inline constexpr adopt_lock_t adopt_lock { };

 // 33.6.5, locks
 template<class Mutex> class lock_guard;
 template<class... MutexTypes> class scoped_lock;
 template<class Mutex> class unique_lock;

 template<class Mutex>
 void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

 // 33.6.6, generic locking algorithms
 template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
 template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

 struct once_flag;

 template<class Callable, class... Args>
 void call_once(once_flag& flag, Callable&& func, Args&&... args);
}

```

### 33.6.3 Header <shared\_mutex> synopsis

[shared.mutex.syn]

```

namespace std {
 // 33.6.4.2, class shared_mutex
 class shared_mutex;
 // 33.6.4.5.2, class shared_timed_mutex
 class shared_timed_mutex;
 // 33.6.5.5, class template shared_lock
 template<class Mutex> class shared_lock;
 template<class Mutex>
 void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}

```

### 33.6.4 Mutex requirements

[thread.mutex.requirements]

#### 33.6.4.1 In general

[thread.mutex.requirements.general]

- 1 A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (33.2.5). An execution agent *owns* a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

#### 33.6.4.2 Mutex types

[thread.mutex.requirements.mutex]

##### 33.6.4.2.1 General

[thread.mutex.requirements.mutex.general]

- 1 The *mutex types* are the standard library types `mutex`, `recursive_mutex`, `timed_mutex`, `recursive_timed_mutex`, `shared_mutex`, and `shared_timed_mutex`. They meet the requirements set out in 33.6.4.2. In this description,  $m$  denotes an object of a mutex type.

[Note 1: The mutex types meet the *Cpp17Lockable* requirements (33.2.5.3). — end note]

- <sup>2</sup> The mutex types meet *Cpp17DefaultConstructible* and *Cpp17Destructible*. If initialization of an object of a mutex type fails, an exception of type `system_error` is thrown. The mutex types are neither copyable nor movable.
- <sup>3</sup> The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:
- (3.1) — `resource_unavailable_try_again` — if any native handle type manipulated is not available.
  - (3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
  - (3.3) — `invalid_argument` — if any native handle type manipulated as part of mutex construction is incorrect.
- <sup>4</sup> The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.9.2). The lock and unlock operations on a single mutex appears to occur in a single total order.

[*Note 2*: This can be viewed as the modification order (6.9.2) of the mutex. — *end note*]

[*Note 3*: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization can be used to ensure that mutex objects are initialized and visible to other threads. — *end note*]

- <sup>5</sup> The expression `m.lock()` is well-formed and has the following semantics:

- <sup>6</sup> *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.
- <sup>7</sup> *Effects*: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.
- <sup>8</sup> *Synchronization*: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
- <sup>9</sup> *Postconditions*: The calling thread owns the mutex.
- <sup>10</sup> *Return type*: `void`.
- <sup>11</sup> *Throws*: `system_error` when an exception is required (33.2.2).

- <sup>12</sup> *Error conditions*:

- (12.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- (12.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

- <sup>13</sup> The expression `m.try_lock()` is well-formed and has the following semantics:

- <sup>14</sup> *Preconditions*: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.
- <sup>15</sup> *Effects*: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

[*Note 4*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (33.5). — *end note*]

An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

- <sup>16</sup> *Synchronization*: If `try_lock()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

[*Note 5*: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — *end note*]

- <sup>17</sup> *Return type*: `bool`.

- <sup>18</sup> *Returns*: `true` if ownership was obtained, otherwise `false`.

- <sup>19</sup> *Throws*: Nothing.

- <sup>20</sup> The expression `m.unlock()` is well-formed and has the following semantics:

- <sup>21</sup> *Preconditions*: The calling thread owns the mutex.

- <sup>22</sup> *Effects*: Releases the calling thread's ownership of the mutex.

- <sup>23</sup> *Return type*: `void`.

- <sup>24</sup> *Synchronization*: This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.

25        *Throws:* Nothing.

### 33.6.4.2.2 Class mutex

[thread.mutex.class]

```
namespace std {
 class mutex {
 public:
 constexpr mutex() noexcept;
 ~mutex();

 mutex(const mutex&) = delete;
 mutex& operator=(const mutex&) = delete;

 void lock();
 bool try_lock();
 void unlock();

 using native_handle_type = implementation-defined; // see 33.2.3
 native_handle_type native_handle(); // see 33.2.3
 };
}
```

- 1 The class **mutex** provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a **mutex** object, attempts by another thread to acquire ownership of that object will fail (for **try\_lock()**) or block (for **lock()**) until the owning thread has released ownership with a call to **unlock()**.
- 2 [Note 1: After a thread A has called **unlock()**, releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread A doesn't access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — end note]
- 3 The class **mutex** meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).
- 4 [Note 2: A program can deadlock if the thread that owns a **mutex** object calls **lock()** on that object. If the implementation can detect the deadlock, a **resource\_deadlock\_would\_occur** error condition might be observed. — end note]
- 5 The behavior of a program is undefined if it destroys a **mutex** object owned by any thread or a thread terminates while owning a **mutex** object.

### 33.6.4.2.3 Class recursive\_mutex

[thread.mutex.recursive]

```
namespace std {
 class recursive_mutex {
 public:
 recursive_mutex();
 ~recursive_mutex();

 recursive_mutex(const recursive_mutex&) = delete;
 recursive_mutex& operator=(const recursive_mutex&) = delete;

 void lock();
 bool try_lock() noexcept;
 void unlock();

 using native_handle_type = implementation-defined; // see 33.2.3
 native_handle_type native_handle(); // see 33.2.3
 };
}
```

- 1 The class **recursive\_mutex** provides a recursive mutex with exclusive ownership semantics. If one thread owns a **recursive\_mutex** object, attempts by another thread to acquire ownership of that object will fail (for **try\_lock()**) or block (for **lock()**) until the first thread has completely released ownership.
- 2 The class **recursive\_mutex** meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).
- 3 A thread that owns a **recursive\_mutex** object may acquire additional levels of ownership by calling **lock()** or **try\_lock()** on that object. It is unspecified how many levels of ownership may be acquired by a single

thread. If a thread has already acquired the maximum level of ownership for a `recursive_mutex` object, additional calls to `try_lock()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()` and `try_lock()`. Only when all levels of ownership have been released may ownership be acquired by another thread.

- <sup>4</sup> The behavior of a program is undefined if:

(4.1) — it destroys a `recursive_mutex` object owned by any thread or

(4.2) — a thread terminates while owning a `recursive_mutex` object.

### 33.6.4.3 Timed mutex types

[`thread.timedmutex.requirements`]

#### 33.6.4.3.1 General

[`thread.timedmutex.requirements.general`]

- <sup>1</sup> The *timed mutex types* are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_timed_mutex`. They meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (29.5), and `abs_time` denotes an object of an instantiation of `time_point` (29.6).

[*Note 1*: The timed mutex types meet the *Cpp17TimedLockable* requirements (33.2.5.4). — *end note*]

- <sup>2</sup> The expression `m.try_lock_for(rel_time)` is well-formed and has the following semantics:

<sup>3</sup> *Preconditions*: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

<sup>4</sup> *Effects*: The function attempts to obtain ownership of the mutex within the relative timeout (33.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object.

[*Note 2*: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

<sup>5</sup> *Synchronization*: If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

<sup>6</sup> *Return type*: `bool`.

<sup>7</sup> *Returns*: `true` if ownership was obtained, otherwise `false`.

<sup>8</sup> *Throws*: Timeout-related exceptions (33.2.4).

- <sup>9</sup> The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

<sup>10</sup> *Preconditions*: If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

<sup>11</sup> *Effects*: The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (33.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object.

[*Note 3*: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

<sup>12</sup> *Synchronization*: If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

<sup>13</sup> *Return type*: `bool`.

<sup>14</sup> *Returns*: `true` if ownership was obtained, otherwise `false`.

<sup>15</sup> *Throws*: Timeout-related exceptions (33.2.4).

#### 33.6.4.3.2 Class `timed_mutex`

[`thread.timedmutex.class`]

```
namespace std {
 class timed_mutex {
 public:
 timed_mutex();
 ~timed_mutex();
```

```

timed_mutex(const timed_mutex&) = delete;
timed_mutex& operator=(const timed_mutex&) = delete;

void lock(); // blocking
bool try_lock();
template<class Rep, class Period>
 bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
 bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock();

using native_handle_type = implementation-defined; // see 33.2.3
native_handle_type native_handle(); // see 33.2.3
};

}

```

- <sup>1</sup> The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- <sup>2</sup> The class `timed_mutex` meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).
- 3 The behavior of a program is undefined if:
  - (3.1) — it destroys a `timed_mutex` object owned by any thread,
  - (3.2) — a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
  - (3.3) — a thread terminates while owning a `timed_mutex` object.

### 33.6.4.3.3 Class recursive\_timed\_mutex

[thread.timedmutex.recursive]

```

namespace std {
 class recursive_timed_mutex {
 public:
 recursive_timed_mutex();
 ~recursive_timed_mutex();

 recursive_timed_mutex(const recursive_timed_mutex&) = delete;
 recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

 void lock(); // blocking
 bool try_lock() noexcept;
 template<class Rep, class Period>
 bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
 template<class Clock, class Duration>
 bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
 void unlock();

 using native_handle_type = implementation-defined; // see 33.2.3
 native_handle_type native_handle(); // see 33.2.3
 };
}

```

- <sup>1</sup> The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- <sup>2</sup> The class `recursive_timed_mutex` meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).

- <sup>3</sup> A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.
- <sup>4</sup> The behavior of a program is undefined if:
- (4.1) — it destroys a `recursive_timed_mutex` object owned by any thread, or
  - (4.2) — a thread terminates while owning a `recursive_timed_mutex` object.

### 33.6.4.4 Shared mutex types

[`thread.sharedmutex.requirements`]

#### 33.6.4.4.1 General

[`thread.sharedmutex.requirements.general`]

- <sup>1</sup> The standard library types `shared_mutex` and `shared_timed_mutex` are *shared mutex types*. Shared mutex types meet the requirements of mutex types (33.6.4.2) and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared mutex type.

[*Note 1*: The shared mutex types meet the `Cpp17SharedLockable` requirements (33.2.5.5). — *end note*]

- <sup>2</sup> In addition to the exclusive lock ownership mode specified in 33.6.4.2, shared mutex types provide a *shared lock* ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.

- <sup>3</sup> The expression `m.lock_shared()` is well-formed and has the following semantics:

<sup>4</sup> *Preconditions*: The calling thread has no ownership of the mutex.

<sup>5</sup> *Effects*: Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.

<sup>6</sup> *Synchronization*: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

<sup>7</sup> *Postconditions*: The calling thread has a shared lock on the mutex.

<sup>8</sup> *Return type*: `void`.

<sup>9</sup> *Throws*: `system_error` when an exception is required (33.2.2).

<sup>10</sup> *Error conditions*:

<sup>(10.1)</sup> — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

<sup>(10.2)</sup> — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

- <sup>11</sup> The expression `m.unlock_shared()` is well-formed and has the following semantics:

<sup>12</sup> *Preconditions*: The calling thread holds a shared lock on the mutex.

<sup>13</sup> *Effects*: Releases a shared lock on the mutex held by the calling thread.

<sup>14</sup> *Return type*: `void`.

<sup>15</sup> *Synchronization*: This operation synchronizes with (6.9.2) subsequent `lock()` operations that obtain ownership on the same object.

<sup>16</sup> *Throws*: Nothing.

- <sup>17</sup> The expression `m.try_lock_shared()` is well-formed and has the following semantics:

<sup>18</sup> *Preconditions*: The calling thread has no ownership of the mutex.

<sup>19</sup> *Effects*: Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

20        *Synchronization:* If `try_lock_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

21        *Return type:* `bool`.

22        *Returns:* `true` if the shared lock was acquired, otherwise `false`.

23        *Throws:* Nothing.

### 33.6.4.4.2 Class `shared_mutex`

[`thread.sharedmutex.class`]

```
namespace std {
 class shared_mutex {
 public:
 shared_mutex();
 ~shared_mutex();

 shared_mutex(const shared_mutex&) = delete;
 shared_mutex& operator=(const shared_mutex&) = delete;

 // exclusive ownership
 void lock(); // blocking
 bool try_lock();
 void unlock();

 // shared ownership
 void lock_shared(); // blocking
 bool try_lock_shared();
 void unlock_shared();

 using native_handle_type = implementation-defined; // see 33.2.3
 native_handle_type native_handle(); // see 33.2.3
 };
}
```

- <sup>1</sup> The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.
- <sup>2</sup> The class `shared_mutex` meets all of the shared mutex requirements (33.6.4.4). It is a standard-layout class (11.2).
- <sup>3</sup> The behavior of a program is undefined if:
  - (3.1) — it destroys a `shared_mutex` object owned by any thread,
  - (3.2) — a thread attempts to recursively gain any ownership of a `shared_mutex`, or
  - (3.3) — a thread terminates while possessing any ownership of a `shared_mutex`.
- <sup>4</sup> `shared_mutex` may be a synonym for `shared_timed_mutex`.

### 33.6.4.5 Shared timed mutex types

[`thread.sharedtimedmutex.requirements`]

#### 33.6.4.5.1 General

[`thread.sharedtimedmutex.requirements.general`]

- <sup>1</sup> The standard library type `shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (33.6.4.3), shared mutex types (33.6.4.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_time` denotes an object of an instantiation of `duration` (29.5), and `abs_time` denotes an object of an instantiation of `time_point` (29.6).

[*Note 1:* The shared timed mutex types meet the *Cpp17SharedTimedLockable* requirements (33.2.5.6). — *end note*]

- <sup>2</sup> The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:

<sup>3</sup> *Preconditions:* The calling thread has no ownership of the mutex.

<sup>4</sup> *Effects:* Attempts to obtain shared lock ownership for the calling thread within the relative timeout (33.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object.

[*Note 2*: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

If an exception is thrown then a shared lock has not been acquired for the current thread.

<sup>5</sup> *Synchronization*: If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

<sup>6</sup> *Return type*: `bool`.

<sup>7</sup> *Returns*: `true` if the shared lock was acquired, otherwise `false`.

<sup>8</sup> *Throws*: Timeout-related exceptions (33.2.4).

<sup>9</sup> The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

<sup>10</sup> *Preconditions*: The calling thread has no ownership of the mutex.

<sup>11</sup> *Effects*: The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function returns before the absolute timeout (33.2.4) specified by `abs_time` only if it has obtained shared ownership of the mutex object.

[*Note 3*: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — *end note*]

If an exception is thrown then a shared lock has not been acquired for the current thread.

<sup>12</sup> *Synchronization*: If `try_lock_shared_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

<sup>13</sup> *Return type*: `bool`.

<sup>14</sup> *Returns*: `true` if the shared lock was acquired, otherwise `false`.

<sup>15</sup> *Throws*: Timeout-related exceptions (33.2.4).

### 33.6.4.5.2 Class `shared_timed_mutex`

[`thread.sharedtimedmutex.class`]

```
namespace std {
 class shared_timed_mutex {
 public:
 shared_timed_mutex();
 ~shared_timed_mutex();

 shared_timed_mutex(const shared_timed_mutex&) = delete;
 shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

 // exclusive ownership
 void lock(); // blocking
 bool try_lock();
 template<class Rep, class Period>
 bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
 template<class Clock, class Duration>
 bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
 void unlock();

 // shared ownership
 void lock_shared(); // blocking
 bool try_lock_shared();
 template<class Rep, class Period>
 bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
 template<class Clock, class Duration>
 bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
 void unlock_shared();
 };
}
```

<sup>1</sup> The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.

<sup>2</sup> The class `shared_timed_mutex` meets all of the shared timed mutex requirements (33.6.4.5). It is a standard-layout class (11.2).

<sup>3</sup> The behavior of a program is undefined if:

- (3.1) — it destroys a `shared_timed_mutex` object owned by any thread,
- (3.2) — a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
- (3.3) — a thread terminates while possessing any ownership of a `shared_timed_mutex`.

### 33.6.5 Locks

[`thread.lock`]

#### 33.6.5.1 General

[`thread.lock.general`]

<sup>1</sup> A *lock* is an object that holds a reference to a lockable object and may unlock the lockable object during the lock's destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to *own* a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

[*Note 1*: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — *end note*]

<sup>2</sup> Some lock constructors take tag types which describe what should be done with the lockable object during the lock's construction.

```
namespace std {
 struct defer_lock_t { }; // do not acquire ownership of the mutex
 struct try_to_lock_t { }; // try to acquire ownership of the mutex
 // without blocking
 struct adopt_lock_t { }; // assume the calling thread has already
 // obtained mutex ownership and manage it

 inline constexpr defer_lock_t defer_lock { };
 inline constexpr try_to_lock_t try_to_lock { };
 inline constexpr adopt_lock_t adopt_lock { };
}
```

#### 33.6.5.2 Class template `lock_guard`

[`thread.lock.guard`]

```
namespace std {
 template<class Mutex>
 class lock_guard {
 public:
 using mutex_type = Mutex;

 explicit lock_guard(mutex_type& m);
 lock_guard(mutex_type& m, adopt_lock_t);
 ~lock_guard();

 lock_guard(const lock_guard&) = delete;
 lock_guard& operator=(const lock_guard&) = delete;

 private:
 mutex_type& pm; // exposition only
 };
}
```

<sup>1</sup> An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object's lifetime (6.7.3). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (33.2.5.2).

`explicit lock_guard(mutex_type& m);`

<sup>2</sup> *Effects*: Initializes `pm` with `m`. Calls `m.lock()`.

`lock_guard(mutex_type& m, adopt_lock_t);`

<sup>3</sup> *Preconditions*: The calling thread holds a non-shared lock on `m`.

<sup>4</sup> *Effects*: Initializes `pm` with `m`.

<sup>5</sup> *Throws*: Nothing.

`~lock_guard();`  
 6     *Effects:* Equivalent to: `pm.unlock()`

### 33.6.5.3 Class template `scoped_lock`

[`thread.lock.scoped`]

```
namespace std {
 template<class... MutexTypes>
 class scoped_lock {
 public:
 using mutex_type = see below; // Only if sizeof...(MutexTypes) == 1 is true

 explicit scoped_lock(MutexTypes&... m);
 explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
 ~scoped_lock();

 scoped_lock(const scoped_lock&) = delete;
 scoped_lock& operator=(const scoped_lock&) = delete;

 private:
 tuple<MutexTypes&...> pm; // exposition only
 };
}
```

- 1 An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object's lifetime (6.7.3). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `scoped_lock` object.

- (1.1) — If `sizeof...(MutexTypes)` is one, let `Mutex` denote the sole type constituting the pack `MutexTypes`. `Mutex` shall meet the *Cpp17BasicLockable* requirements (33.2.5.2). The member *typedef-name* `mutex_type` denotes the same type as `Mutex`.
- (1.2) — Otherwise, all types in the template parameter pack `MutexTypes` shall meet the *Cpp17Lockable* requirements (33.2.5.3) and there is no member `mutex_type`.

`explicit scoped_lock(MutexTypes&... m);`

- 2     *Effects:* Initializes `pm` with `tie(m...)`. Then if `sizeof...(MutexTypes)` is 0, no effects. Otherwise if `sizeof...(MutexTypes)` is 1, then `m.lock()`. Otherwise, `lock(m...)`.

`explicit scoped_lock(adopt_lock_t, MutexTypes&... m);`

- 3     *Preconditions:* The calling thread holds a non-shared lock on each element of `m`.

- 4     *Effects:* Initializes `pm` with `tie(m...)`.

- 5     *Throws:* Nothing.

`~scoped_lock();`

- 6     *Effects:* For all `i` in `[0, sizeof...(MutexTypes))`, `get<i>(pm).unlock()`.

### 33.6.5.4 Class template `unique_lock`

[`thread.lock.unique`]

#### 33.6.5.4.1 General

[`thread.lock.unique.general`]

```
namespace std {
 template<class Mutex>
 class unique_lock {
 public:
 using mutex_type = Mutex;

 // 33.6.5.4.2, construct/copy/destroy
 unique_lock() noexcept;
 explicit unique_lock(mutex_type& m);
 unique_lock(mutex_type& m, defer_lock_t) noexcept;
 unique_lock(mutex_type& m, try_to_lock_t);
 unique_lock(mutex_type& m, adopt_lock_t);
 template<class Clock, class Duration>
 unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
```

```

template<class Rep, class Period>
 unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
~unique_lock();

unique_lock(const unique_lock&) = delete;
unique_lock& operator=(const unique_lock&) = delete;

unique_lock(unique_lock&& u) noexcept;
unique_lock& operator=(unique_lock&& u);

// 33.6.5.4.3, locking
void lock();
bool try_lock();

template<class Rep, class Period>
 bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
 bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

void unlock();

// 33.6.5.4.4, modifiers
void swap(unique_lock& u) noexcept;
mutex_type* release() noexcept;

// 33.6.5.4.5, observers
bool owns_lock() const noexcept;
explicit operator bool () const noexcept;
mutex_type* mutex() const noexcept;

private:
 mutex_type* pm; // exposition only
 bool owns; // exposition only
};

}

```

- 1 An object of type `unique_lock` controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `unique_lock` object. Objects of type `unique_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `unique_lock` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (33.2.5.2).
- 2 [Note 1: `unique_lock<Mutex>` meets the *Cpp17BasicLockable* requirements. If `Mutex` meets the *Cpp17Lockable* requirements (33.2.5.3), `unique_lock<Mutex>` also meets the *Cpp17Lockable* requirements; if `Mutex` meets the *Cpp17TimedLockable* requirements (33.2.5.4), `unique_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements.  
— end note]

### 33.6.5.4.2 Constructors, destructor, and assignment

[`thread.lock.unique.cons`]

- unique\_lock() noexcept;
- Postconditions:* `pm == nullptr` and `owns == false`.
- `explicit unique_lock(mutex_type& m);`
- Effects:* Calls `m.lock()`.
- Postconditions:* `pm == addressof(m)` and `owns == true`.
- `unique_lock(mutex_type& m, defer_lock_t) noexcept;`
- Postconditions:* `pm == addressof(m)` and `owns == false`.
- `unique_lock(mutex_type& m, try_to_lock_t);`
- Preconditions:* The supplied `Mutex` type meets the *Cpp17Lockable* requirements (33.2.5.3).
- Effects:* Calls `m.try_lock()`.

7       *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock()`.

8       *Preconditions:* The calling thread holds a non-shared lock on `m`.

9       *Postconditions:* `pm == addressof(m)` and `owns == true`.

10      *Throws:* Nothing.

```
template<class Clock, class Duration>
unique_lock(mutex_type& m, adopt_lock_t);
```

11     *Preconditions:* The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements ([33.2.5.4](#)).

12     *Effects:* Calls `m.try_lock_until(abs_time)`.

13     *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_until(abs_time)`.

```
template<class Rep, class Period>
unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
```

14     *Preconditions:* The supplied `Mutex` type meets the *Cpp17TimedLockable* requirements ([33.2.5.4](#)).

15     *Effects:* Calls `m.try_lock_for(rel_time)`.

16     *Postconditions:* `pm == addressof(m)` and `owns == res`, where `res` is the value returned by the call to `m.try_lock_for(rel_time)`.

```
unique_lock(unique_lock&& u) noexcept;
```

17     *Postconditions:* `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

```
unique_lock& operator=(unique_lock&& u);
```

18     *Effects:* If `owns` calls `pm->unlock()`.

19     *Postconditions:* `pm == u_p.pm` and `owns == u_p.owns` (where `u_p` is the state of `u` just prior to this construction), `u.pm == 0` and `u.owns == false`.

20     [*Note 1:* With a recursive mutex it is possible for both `*this` and `u` to own the same mutex before the assignment. In this case, `*this` will own the mutex after the assignment and `u` will not. —*end note*]

21     *Throws:* Nothing.

```
~unique_lock();
```

22     *Effects:* If `owns` calls `pm->unlock()`.

### 33.6.5.4.3 Locking

[**thread.lock.unique.locking**]

```
void lock();
```

1       *Effects:* As if by `pm->lock()`.

2       *Postconditions:* `owns == true`.

3       *Throws:* Any exception thrown by `pm->lock()`. `system_error` when an exception is required ([33.2.2](#)).

4       *Error conditions:*

(4.1)     — `operation_not_permitted` — if `pm` is `nullptr`.

(4.2)     — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
bool try_lock();
```

5       *Preconditions:* The supplied `Mutex` meets the *Cpp17Lockable* requirements ([33.2.5.3](#)).

6       *Effects:* As if by `pm->try_lock()`.

7       *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock()`.

8       *Returns:* The value returned by `pm->try_lock()`.

9       *Throws:* Any exception thrown by `pm->try_lock()`. `system_error` when an exception is required  
 (33.2.2).

10      *Error conditions:*

(10.1)     — `operation_not_permitted` — if `pm` is `nullptr`.

(10.2)     — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

11      *Preconditions:* The supplied `Mutex` type meets the `Cpp17TimedLockable` requirements (33.2.5.4).

12      *Effects:* As if by `pm->try_lock_until(abs_time)`.

13      *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock_until(abs_time)`.

14      *Returns:* The value returned by `pm->try_lock_until(abs_time)`.

15      *Throws:* Any exception thrown by `pm->try_lock_until(abstime)`. `system_error` when an exception is required (33.2.2).

16      *Error conditions:*

(16.1)     — `operation_not_permitted` — if `pm` is `nullptr`.

(16.2)     — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

17      *Preconditions:* The supplied `Mutex` type meets the `Cpp17TimedLockable` requirements (33.2.5.4).

18      *Effects:* As if by `pm->try_lock_for(rel_time)`.

19      *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock_for(rel_time)`.

20      *Returns:* The value returned by `pm->try_lock_for(rel_time)`.

21      *Throws:* Any exception thrown by `pm->try_lock_for(rel_time)`. `system_error` when an exception is required (33.2.2).

22      *Error conditions:*

(22.1)     — `operation_not_permitted` — if `pm` is `nullptr`.

(22.2)     — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

```
void unlock();
```

23      *Effects:* As if by `pm->unlock()`.

24      *Postconditions:* `owns == false`.

25      *Throws:* `system_error` when an exception is required (33.2.2).

26      *Error conditions:*

(26.1)     — `operation_not_permitted` — if on entry `owns` is `false`.

### 33.6.5.4.4 Modifiers

[`thread.lock.unique.mod`]

```
void swap(unique_lock& u) noexcept;
```

1       *Effects:* Swaps the data members of `*this` and `u`.

```
mutex_type* release() noexcept;
```

2       *Postconditions:* `pm == 0` and `owns == false`.

3       *Returns:* The previous value of `pm`.

```
template<class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
```

4       *Effects:* As if by `x.swap(y)`.

**33.6.5.4.5 Observers**

[thread.lock.unique.obs]

```
bool owns_lock() const noexcept;
1 Returns: owns.

explicit operator bool() const noexcept;
2 Returns: owns.

mutex_type *mutex() const noexcept;
3 Returns: pm.
```

**33.6.5.5 Class template shared\_lock**

[thread.lock.shared]

**33.6.5.5.1 General**

[thread.lock.shared.general]

```
namespace std {
 template<class Mutex>
 class shared_lock {
 public:
 using mutex_type = Mutex;

 // 33.6.5.5.2, construct/copy/destroy
 shared_lock() noexcept;
 explicit shared_lock(mutex_type& m); // blocking
 shared_lock(mutex_type& m, defer_lock_t) noexcept;
 shared_lock(mutex_type& m, try_to_lock_t);
 shared_lock(mutex_type& m, adopt_lock_t);
 template<class Clock, class Duration>
 shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
 template<class Rep, class Period>
 shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
 ~shared_lock();

 shared_lock(const shared_lock&) = delete;
 shared_lock& operator=(const shared_lock&) = delete;

 shared_lock(shared_lock&& u) noexcept;
 shared_lock& operator=(shared_lock&& u) noexcept;

 // 33.6.5.5.3, locking
 void lock(); // blocking
 bool try_lock();
 template<class Rep, class Period>
 bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
 template<class Clock, class Duration>
 bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
 void unlock();

 // 33.6.5.5.4, modifiers
 void swap(shared_lock& u) noexcept;
 mutex_type* release() noexcept;

 // 33.6.5.5.5, observers
 bool owns_lock() const noexcept;
 explicit operator bool () const noexcept;
 mutex_type* mutex() const noexcept;

 private:
 mutex_type* pm; // exposition only
 bool owns; // exposition only
 };
 }
}
```

<sup>1</sup> An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred,

after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `shared_lock` object. The supplied `Mutex` type shall meet the *Cpp17SharedLockable* requirements (33.2.5.5).

- 2 [Note 1: `shared_lock<Mutex>` meets the *Cpp17Lockable* requirements (33.2.5.3). If `Mutex` meets the *Cpp17SharedTimedLockable* requirements (33.2.5.6), `shared_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements (33.2.5.4). — end note]

### 33.6.5.5.2 Constructors, destructor, and assignment

[`thread.lock.shared.cons`]

```
shared_lock() noexcept;
1 Postconditions: pm == nullptr and owns == false.

explicit shared_lock(mutex_type& m);
2 Effects: Calls m.lock_shared().

Postconditions: pm == addressof(m) and owns == true.

shared_lock(mutex_type& m, defer_lock_t) noexcept;
4 Postconditions: pm == addressof(m) and owns == false.

shared_lock(mutex_type& m, try_to_lock_t);
5 Effects: Calls m.try_lock_shared().

Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
m.try_lock_shared().

shared_lock(mutex_type& m, adopt_lock_t);
7 Preconditions: The calling thread holds a shared lock on m.
8 Postconditions: pm == addressof(m) and owns == true.

template<class Clock, class Duration>
 shared_lock(mutex_type& m,
 const chrono::time_point<Clock, Duration>& abs_time);
9 Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

Effects: Calls m.try_lock_shared_until(abs_time).

Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
m.try_lock_shared_until(abs_time).

template<class Rep, class Period>
 shared_lock(mutex_type& m,
 const chrono::duration<Rep, Period>& rel_time);
12 Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

Effects: Calls m.try_lock_shared_for(rel_time).

Postconditions: pm == addressof(m) and owns == res where res is the value returned by the call to
m.try_lock_shared_for(rel_time).

~shared_lock();
15 Effects: If owns calls pm->unlock_shared().

shared_lock(shared_lock&& sl) noexcept;
16 Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to
this construction), sl.pm == nullptr and sl.owns == false.

shared_lock& operator=(shared_lock&& sl) noexcept;
17 Effects: If owns calls pm->unlock_shared().

Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to
this assignment), sl.pm == nullptr and sl.owns == false.
```

**33.6.5.5.3 Locking**

[thread.lock.shared.locking]

`void lock();`1      *Effects:* As if by `pm->lock_shared()`.2      *Postconditions:* `owns == true`.3      *Throws:* Any exception thrown by `pm->lock_shared()`. `system_error` when an exception is required (33.2.2).4      *Error conditions:*(4.1)     — `operation_not_permitted` — if `pm` is `nullptr`.(4.2)     — `resource_deadlock_would_occur` — if on entry `owns` is `true`.`bool try_lock();`5      *Effects:* As if by `pm->try_lock_shared()`.6      *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared()`.7      *Returns:* The value returned by the call to `pm->try_lock_shared()`.8      *Throws:* Any exception thrown by `pm->try_lock_shared()`. `system_error` when an exception is required (33.2.2).9      *Error conditions:*(9.1)     — `operation_not_permitted` — if `pm` is `nullptr`.(9.2)     — `resource_deadlock_would_occur` — if on entry `owns` is `true`.`template<class Clock, class Duration>  
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);`10     *Preconditions:* `Mutex` meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6).11     *Effects:* As if by `pm->try_lock_shared_until(abs_time)`.12     *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_until(abs_time)`.13     *Returns:* The value returned by the call to `pm->try_lock_shared_until(abs_time)`.14     *Throws:* Any exception thrown by `pm->try_lock_shared_until(abs_time)`. `system_error` when an exception is required (33.2.2).15     *Error conditions:*(15.1)     — `operation_not_permitted` — if `pm` is `nullptr`.(15.2)     — `resource_deadlock_would_occur` — if on entry `owns` is `true`.`template<class Rep, class Period>  
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);`16     *Preconditions:* `Mutex` meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6).17     *Effects:* As if by `pm->try_lock_shared_for(rel_time)`.18     *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_for(rel_time)`.19     *Returns:* The value returned by the call to `pm->try_lock_shared_for(rel_time)`.20     *Throws:* Any exception thrown by `pm->try_lock_shared_for(rel_time)`. `system_error` when an exception is required (33.2.2).21     *Error conditions:*(21.1)     — `operation_not_permitted` — if `pm` is `nullptr`.(21.2)     — `resource_deadlock_would_occur` — if on entry `owns` is `true`.`void unlock();`22     *Effects:* As if by `pm->unlock_shared()`.

23       *Postconditions*: `owns == false`.  
 24       *Throws*: `system_error` when an exception is required ([33.2.2](#)).  
 25       *Error conditions*:  
 (25.1)     — `operation_not_permitted` — if on entry `owns` is `false`.

**33.6.5.5.4 Modifiers**

[thread.lock.shared.mod]

```
void swap(shared_lock& sl) noexcept;

1 Effects: Swaps the data members of *this and sl.

 mutex_type* release() noexcept;

2 Postconditions: pm == nullptr and owns == false.

3 Returns: The previous value of pm.

 template<class Mutex>

 void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;

4 Effects: As if by x.swap(y).
```

**33.6.5.5 Observers**

[thread.lock.shared.obs]

```
bool owns_lock() const noexcept;

1 Returns: owns.

 explicit operator bool() const noexcept;

2 Returns: owns.

 mutex_type* mutex() const noexcept;

3 Returns: pm.
```

**33.6.6 Generic locking algorithms**

[thread.lock.algorithm]

```
template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);

1 Preconditions: Each template parameter type meets the Cpp17Lockable requirements.

 [Note 1: The unique_lock class template meets these requirements when suitably instantiated. — end note]

2 Effects: Calls try_lock() for each argument in order beginning with the first until all arguments have been processed or a call to try_lock() fails, either by returning false or by throwing an exception. If a call to try_lock() fails, unlock() is called for all prior arguments with no further calls to try_lock().

3 Returns: -1 if all calls to try_lock() returned true, otherwise a zero-based index value that indicates the argument for which try_lock() returned false.
```

```
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);
```

4       *Preconditions*: Each template parameter type meets the *Cpp17Lockable* requirements.  
 [Note 2: The `unique_lock` class template meets these requirements when suitably instantiated. — *end note*]  
5       *Effects*: All arguments are locked via a sequence of calls to `lock()`, `try_lock()`, or `unlock()` on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.  
 [Note 3: A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations. — *end note*]  
 If a call to `lock()` or `try_lock()` throws an exception, `unlock()` is called for any argument that had been locked by a call to `lock()` or `try_lock()`.

**33.6.7 Call once**

[thread.once]

**33.6.7.1 Struct once\_flag**

[thread.once.onceflag]

```
namespace std {

 struct once_flag {

 constexpr once_flag() noexcept;
```

```

 once_flag(const once_flag&) = delete;
 once_flag& operator=(const once_flag&) = delete;
};

}

```

- 1 The class `once_flag` is an opaque data structure that `call_once` uses to initialize data without causing a data race or deadlock.

`constexpr once_flag() noexcept;`

- 2 *Synchronization*: The construction of a `once_flag` object is not synchronized.

- 3 *Postconditions*: The object's internal state is set to indicate to an invocation of `call_once` with the object as its initial argument that no function has been called.

### 33.6.7.2 Function `call_once`

[`thread.once.callonce`]

```
template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

- 1 *Mandates*: `is_invocable_v<Callable, Args...>` is true.

- 2 *Effects*: An execution of `call_once` that does not call its `func` is a *passive* execution. An execution of `call_once` that calls its `func` is an *active* execution. An active execution calls `INVOKE(std::forward<Callable>(func), std::forward<Args>(args)...) (22.10.4)`. If such a call to `func` throws an exception the execution is *exceptional*, otherwise it is *returning*. An exceptional execution propagates the exception to the caller of `call_once`. Among all executions of `call_once` for any given `once_flag`: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

[*Note 1*: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — *end note*]

- 3 *Synchronization*: For any given `once_flag`: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

- 4 *Throws*: `system_error` when an exception is required (33.2.2), or any exception thrown by `func`.

- 5 [*Example 1*:

```

// global flag, regular function
void init();
std::once_flag flag;

void f() {
 std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
 void operator()();
};

void g() {
 static std::once_flag flag2;
 std::call_once(flag2, initializer());
}

// object flag, member function
class information {
 std::once_flag verified;
 void verifier();
public:
 void verify() { std::call_once(verified, &information::verifier, *this); }
};

— end example

```

### 33.7 Condition variables

[**thread.condition**]

#### 33.7.1 General

[**thread.condition.general**]

- <sup>1</sup> Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class `condition_variable` provides a condition variable that can only wait on an object of type `unique_lock<mutex>`, allowing the implementation to be more efficient. Class `condition_variable_any` provides a general condition variable that can wait on objects of user-supplied lock types.
- <sup>2</sup> Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.
- <sup>3</sup> The executions of `notify_one` and `notify_all` are atomic. The executions of `wait`, `wait_for`, and `wait_until` are performed in three atomic parts:
  1. the release of the mutex and entry into the waiting state;
  2. the unblocking of the wait; and
  3. the reacquisition of the lock.
- <sup>4</sup> The implementation behaves as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the “happens before” order.
- <sup>5</sup> Condition variable construction and destruction need not be synchronized.

#### 33.7.2 Header <condition\_variable> synopsis

[**condition.variable.syn**]

```
namespace std {
 // 33.7.4, class condition_variable
 class condition_variable;
 // 33.7.5, class condition_variable_any
 class condition_variable_any;

 // 33.7.3, non-member functions
 void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

 enum class cv_status { no_timeout, timeout };
}
```

#### 33.7.3 Non-member functions

[**thread.condition.nonmember**]

`void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);`

- <sup>1</sup> *Preconditions:* `lk` is locked by the calling thread and either
  - (1.1) — no other thread is waiting on `cond`, or
  - (1.2) — `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.
- <sup>2</sup> *Effects:* Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification is equivalent to:

```
lk.unlock();
cond.notify_all();
```

- <sup>3</sup> *Synchronization:* The implied `lk.unlock()` call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.
- <sup>4</sup> [*Note 1:* The supplied lock is held until the thread exits, which might cause deadlock due to lock ordering issues. —*end note*]
- <sup>5</sup> [*Note 2:* It is the user’s responsibility to ensure that waiting threads do not erroneously assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on `lk`, and that this lock is not released and reacquired prior to calling `notify_all_at_thread_exit`. —*end note*]

## 33.7.4 Class condition\_variable

[thread.condition.condvar]

```

namespace std {
 class condition_variable {
 public:
 condition_variable();
 ~condition_variable();

 condition_variable(const condition_variable&) = delete;
 condition_variable& operator=(const condition_variable&) = delete;

 void notify_one() noexcept;
 void notify_all() noexcept;
 void wait(unique_lock<mutex>& lock);
 template<class Predicate>
 void wait(unique_lock<mutex>& lock, Predicate pred);
 template<class Clock, class Duration>
 cv_status wait_until(unique_lock<mutex>& lock,
 const chrono::time_point<Clock, Duration>& abs_time);
 template<class Clock, class Duration, class Predicate>
 bool wait_until(unique_lock<mutex>& lock,
 const chrono::time_point<Clock, Duration>& abs_time,
 Predicate pred);
 template<class Rep, class Period>
 cv_status wait_for(unique_lock<mutex>& lock,
 const chrono::duration<Rep, Period>& rel_time);
 template<class Rep, class Period, class Predicate>
 bool wait_for(unique_lock<mutex>& lock,
 const chrono::duration<Rep, Period>& rel_time,
 Predicate pred);

 using native_handle_type = implementation-defined; // see 33.2.3
 native_handle_type native_handle(); // see 33.2.3
 };
 }
}

```

<sup>1</sup> The class `condition_variable` is a standard-layout class (11.2).

`condition_variable();`

<sup>2</sup> *Throws:* `system_error` when an exception is required (33.2.2).

<sup>3</sup> *Error conditions:*

(3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

`~condition_variable();`

<sup>4</sup> *Preconditions:* There is no thread blocked on `*this`.

[*Note 1:* That is, all threads have been notified; they can subsequently block on the lock specified in the `wait`. This relaxes the usual rules, which would have required all `wait` calls to happen before destruction. Only the notification to unblock the `wait` needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the `wait` functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

`void notify_one() noexcept;`

<sup>5</sup> *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

`void notify_all() noexcept;`

<sup>6</sup> *Effects:* Unblocks all threads that are blocked waiting for `*this`.

`void wait(unique_lock<mutex>& lock);`

<sup>7</sup> *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(7.1) — no other thread is waiting on this `condition_variable` object or

(7.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

8     *Effects:*

(8.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(8.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(8.3) — The function will unblock when signaled by a call to `notify_one()` or a call to `notify_all()`, or spuriously.

9     *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

10    *Throws:* Nothing.

11    *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);
```

12    *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(12.1) — no other thread is waiting on this `condition_variable` object or

(12.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

13    *Effects:* Equivalent to:

```
while (!pred())
 wait(lock);
```

14    *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

15    *Throws:* Any exception thrown by `pred`.

16    *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 3: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Clock, class Duration>
cv_status wait_until(unique_lock<mutex>& lock,
 const chrono::time_point<Clock, Duration>& abs_time);
```

17    *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

(17.1) — no other thread is waiting on this `condition_variable` object or

(17.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

18    *Effects:*

(18.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(18.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(18.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (33.2.4) specified by `abs_time`, or spuriously.

(18.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

19    *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

20    *Returns:* `cv_status::timeout` if the absolute timeout (33.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

21    *Throws:* Timeout-related exceptions (33.2.4).

22    *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 4: This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Rep, class Period>
cv_status wait_for(unique_lock<mutex>& lock,
```

const chrono::duration<Rep, Period>& rel\_time);

23     *Preconditions:* lock.owns\_lock() is true and lock.mutex() is locked by the calling thread, and either  
 (23.1)     — no other thread is waiting on this condition\_variable object or  
 (23.2)     — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently  
           waiting (via wait, wait\_for, or wait\_until) threads.

24     *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

25     *Postconditions:* lock.owns\_lock() is true and lock.mutex() is locked by the calling thread.

26     *Returns:* cv\_status::timeout if the relative timeout (33.2.4) specified by rel\_time expired, otherwise  
       cv\_status::no\_timeout.

27     *Throws:* Timeout-related exceptions (33.2.4).

28     *Remarks:* If the function fails to meet the postcondition, terminate is invoked (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Clock, class Duration, class Predicate>
bool wait_until(unique_lock<mutex>& lock,
 const chrono::time_point<Clock, Duration>& abs_time,
 Predicate pred);
```

29     *Preconditions:* lock.owns\_lock() is true and lock.mutex() is locked by the calling thread, and either  
 (29.1)     — no other thread is waiting on this condition\_variable object or  
 (29.2)     — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently  
           waiting (via wait, wait\_for, or wait\_until) threads.

30     *Effects:* Equivalent to:

```
while (!pred())
 if (wait_until(lock, abs_time) == cv_status::timeout)
 return pred();
return true;
```

31     *Postconditions:* lock.owns\_lock() is true and lock.mutex() is locked by the calling thread.

32     [iNote 6: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout  
   was triggered. — end note]

33     *Throws:* Timeout-related exceptions (33.2.4) or any exception thrown by pred.

34     *Remarks:* If the function fails to meet the postcondition, terminate() is invoked (14.6.2).

[Note 7: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Rep, class Period, class Predicate>
bool wait_for(unique_lock<mutex>& lock,
 const chrono::duration<Rep, Period>& rel_time,
 Predicate pred);
```

35     *Preconditions:* lock.owns\_lock() is true and lock.mutex() is locked by the calling thread, and either  
 (35.1)     — no other thread is waiting on this condition\_variable object or  
 (35.2)     — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently  
           waiting (via wait, wait\_for, or wait\_until) threads.

36     *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

37     [iNote 8: There is no blocking if pred() is initially true, even if the timeout has already expired. — end note]

38     *Postconditions:* lock.owns\_lock() is true and lock.mutex() is locked by the calling thread.

39     [iNote 9: The returned value indicates whether the predicate evaluates to true regardless of whether the timeout  
   was triggered. — end note]

40     *Throws:* Timeout-related exceptions (33.2.4) or any exception thrown by pred.

41     *Remarks:* If the function fails to meet the postcondition, terminate() is invoked (14.6.2).

[Note 10: This can happen if the re-locking of the mutex throws an exception. — end note]

### 33.7.5 Class condition\_variable\_any

[**thread.condition.condvarany**]

#### 33.7.5.1 General

[**thread.condition.condvarany.general**]

- <sup>1</sup> In this subclause 33.7.5, template arguments for template parameters named Lock shall meet the *Cpp17BasicLockable* requirements (33.2.5.2).

[Note 1: All of the standard mutex types meet this requirement. If a type other than one of the standard mutex types or a unique\_lock wrapper for a standard mutex type is used with condition\_variable\_any, any necessary synchronization is assumed to be in place with respect to the predicate associated with the condition\_variable\_any instance. — end note]

```
namespace std {
 class condition_variable_any {
 public:
 condition_variable_any();
 ~condition_variable_any();

 condition_variable_any(const condition_variable_any&) = delete;
 condition_variable_any& operator=(const condition_variable_any&) = delete;

 void notify_one() noexcept;
 void notify_all() noexcept;

 // 33.7.5.2, noninterruptible waits
 template<class Lock>
 void wait(Lock& lock);
 template<class Lock, class Predicate>
 void wait(Lock& lock, Predicate pred);

 template<class Lock, class Clock, class Duration>
 cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
 template<class Lock, class Clock, class Duration, class Predicate>
 bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
 Predicate pred);
 template<class Lock, class Rep, class Period>
 cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
 template<class Lock, class Rep, class Period, class Predicate>
 bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

 // 33.7.5.3, interruptible waits
 template<class Lock, class Predicate>
 bool wait(Lock& lock, stop_token stoken, Predicate pred);
 template<class Lock, class Clock, class Duration, class Predicate>
 bool wait_until(Lock& lock, stop_token stoken,
 const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
 template<class Lock, class Rep, class Period, class Predicate>
 bool wait_for(Lock& lock, stop_token stoken,
 const chrono::duration<Rep, Period>& rel_time, Predicate pred);
 };
 };
}
```

condition\_variable\_any();

- <sup>2</sup> *Throws*: bad\_alloc or system\_error when an exception is required (33.2.2).

- <sup>3</sup> *Error conditions*:

- (3.1) — resource\_unavailable\_try\_again — if some non-memory resource limitation prevents initialization.

- (3.2) — operation\_not\_permitted — if the thread does not have the privilege to perform the operation.

~condition\_variable\_any();

- <sup>4</sup> *Preconditions*: There is no thread blocked on \*this.

[Note 2: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — end note]

```
void notify_one() noexcept;
```

5     *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6     *Effects:* Unblocks all threads that are blocked waiting for `*this`.

### 33.7.5.2 Noninterruptible waits

[`thread.condvarany.wait`]

```
template<class Lock>
void wait(Lock& lock);
```

1     *Effects:*

- (1.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (1.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (1.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, or spuriously.

2     *Postconditions:* `lock` is locked by the calling thread.

3     *Throws:* Nothing.

4     *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 1: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);
```

5     *Effects:* Equivalent to:

```
while (!pred())
 wait(lock);
```

```
template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
```

6     *Effects:*

- (6.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (6.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (6.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (33.2.4) specified by `abs_time`, or spuriously.
- (6.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

7     *Postconditions:* `lock` is locked by the calling thread.

8     *Returns:* `cv_status::timeout` if the absolute timeout (33.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

9     *Throws:* Timeout-related exceptions (33.2.4).

10    *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

11    *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

12    *Postconditions:* `lock` is locked by the calling thread.

13     *Returns:* `cv_status::timeout` if the relative timeout (33.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

14     *Throws:* Timeout-related exceptions (33.2.4).

15     *Remarks:* If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).

[Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

16     *Effects:* Equivalent to:

```
while (!pred())
 if (wait_until(lock, abs_time) == cv_status::timeout)
 return pred();
 return true;
```

17     [Note 4: There is no blocking if `pred()` is initially `true`, or if the timeout has already expired. — end note]

18     [Note 5: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — end note]

```
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

19     *Effects:* Equivalent to:

```
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

### 33.7.5.3 Interruptible waits

[thread.condvarany.intwait]

1     The following wait functions will be notified when there is a stop request on the passed `stop_token`. In that case the functions return immediately, returning `false` if the predicate evaluates to `false`.

```
template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);
```

2     *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
while (!stoken.stop_requested()) {
 if (pred())
 return true;
 wait(lock);
}
```

3     [Note 1: The returned value indicates whether the predicate evaluated to `true` regardless of whether there was a stop request. — end note]

4     *Postconditions:* `lock` is locked by the calling thread.

5     *Throws:* Any exception thrown by `pred`.

6     *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
 const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

7     *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
while (!stoken.stop_requested()) {
 if (pred())
 return true;
 if (wait_until(lock, abs_time) == cv_status::timeout)
 return pred();
}
```

8 [Note 3: There is no blocking if `pred()` is initially `true`, `stoken.stop_requested()` was already `true` or the  
time-out has already expired. —end note]

9 [Note 4: The returned value indicates whether the predicate evaluated to `true` regardless of whether the time-out  
was triggered or a stop request was made. —end note]

10 *Postconditions:* `lock` is locked by the calling thread.

11 *Throws:* Time-out-related exceptions (33.2.4), or any exception thrown by `pred`.

12 *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. —end note]

```
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken,
 const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

13 *Effects:* Equivalent to:

```
return wait_until(lock, std::move(stoken), chrono::steady_clock::now() + rel_time,
 std::move(pred));
```

## 33.8 Semaphore

[thread.sema]

### 33.8.1 General

[thread.sema.general]

- 1 Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.
- 2 A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

### 33.8.2 Header <semaphore> synopsis

[semaphore.syn]

```
namespace std {
// 33.8.3, class template counting_semaphore
template<ptrdiff_t least_max_value = implementation-defined>
class counting_semaphore;

using binary_semaphore = counting_semaphore<1>;
}
```

### 33.8.3 Class template counting\_semaphore

[thread.sema.cnt]

```
namespace std {
template<ptrdiff_t least_max_value = implementation-defined>
class counting_semaphore {
public:
 static constexpr ptrdiff_t max() noexcept;

 constexpr explicit counting_semaphore(ptrdiff_t desired);
 ~counting_semaphore();

 counting_semaphore(const counting_semaphore&) = delete;
 counting_semaphore& operator=(const counting_semaphore&) = delete;

 void release(ptrdiff_t update = 1);
 void acquire();
 bool try_acquire() noexcept;
 template<class Rep, class Period>
 bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
 template<class Clock, class Duration>
 bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

private:
 ptrdiff_t counter; // exposition only
};
```

<sup>1</sup> Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

<sup>2</sup> `least_max_value` shall be non-negative; otherwise the program is ill-formed.

<sup>3</sup> Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.

```
static constexpr ptrdiff_t max() noexcept;
```

<sup>4</sup> *Returns*: The maximum value of `counter`. This value is greater than or equal to `least_max_value`.

```
constexpr explicit counting_semaphore(ptrdiff_t desired);
```

<sup>5</sup> *Preconditions*: `desired >= 0` is true, and `desired <= max()` is true.

<sup>6</sup> *Effects*: Initializes `counter` with `desired`.

<sup>7</sup> *Throws*: Nothing.

```
void release(ptrdiff_t update = 1);
```

<sup>8</sup> *Preconditions*: `update >= 0` is true, and `update <= max() - counter` is true.

<sup>9</sup> *Effects*: Atomically execute `counter += update`. Then, unblocks any threads that are waiting for `counter` to be greater than zero.

<sup>10</sup> *Synchronization*: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

<sup>11</sup> *Throws*: `system_error` when an exception is required ([33.2.2](#)).

<sup>12</sup> *Error conditions*: Any of the error conditions allowed for mutex types ([33.6.4.2](#)).

```
bool try_acquire() noexcept;
```

<sup>13</sup> *Effects*: Attempts to atomically decrement `counter` if it is positive, without blocking. If `counter` is not decremented, there is no effect and `try_acquire` immediately returns. An implementation may fail to decrement `counter` even if it is positive.

[*Note 1*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange ([33.5](#)). — *end note*]

An implementation should ensure that `try_acquire` does not consistently return `false` in the absence of contending semaphore operations.

<sup>14</sup> *Returns*: `true` if `counter` was decremented, otherwise `false`.

```
void acquire();
```

<sup>15</sup> *Effects*: Repeatedly performs the following steps, in order:

- Evaluates `try_acquire()`. If the result is `true`, returns.

(15.2) 

- Blocks on `*this` until `counter` is greater than zero.

<sup>16</sup> *Throws*: `system_error` when an exception is required ([33.2.2](#)).

<sup>17</sup> *Error conditions*: Any of the error conditions allowed for mutex types ([33.6.4.2](#)).

```
template<class Rep, class Period>
bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
```

<sup>18</sup> *Effects*: Repeatedly performs the following steps, in order:

- Evaluates `try_acquire()`. If the result is `true`, returns `true`.

(18.2) 

- Blocks on `*this` until `counter` is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns `false`.

The timeout expires ([33.2.4](#)) when the current time is after `abs_time` (for `try_acquire_until`) or when at least `rel_time` has passed from the start of the function (for `try_acquire_for`).

- 19        *Throws:* Timeout-related exceptions (33.2.4), or `system_error` when a non-timeout-related exception  
is required (33.2.2).
- 20        *Error conditions:* Any of the error conditions allowed for mutex types (33.6.4.2).

### 33.9 Coordination types

[`thread.coord`]

#### 33.9.1 General

[`thread.coord.general`]

- <sup>1</sup> Subclause 33.9 describes various concepts related to thread coordination, and defines the coordination types `latch` and `barrier`. These types facilitate concurrent computation performed by a number of threads.

#### 33.9.2 Latches

[`thread.latch`]

##### 33.9.2.1 General

[`thread.latch.general`]

- <sup>1</sup> A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

##### 33.9.2.2 Header <latch> synopsis

[`latch.syn`]

```
namespace std {
 class latch;
}

namespace std {
 class latch {
 public:
 static constexpr ptrdiff_t max() noexcept;

 constexpr explicit latch(ptrdiff_t expected);
 ~latch();

 latch(const latch&) = delete;
 latch& operator=(const latch&) = delete;

 void count_down(ptrdiff_t update = 1);
 bool try_wait() const noexcept;
 void wait() const;
 void arrive_and_wait(ptrdiff_t update = 1);

 private:
 ptrdiff_t counter; // exposition only
 };
}
```

- <sup>1</sup> A `latch` maintains an internal counter that is initialized when the latch is created. Threads can block on the `latch` object, waiting for counter to be decremented to zero.
- <sup>2</sup> Concurrent invocations of the member functions of `latch`, other than its destructor, do not introduce data races.

`static constexpr ptrdiff_t max() noexcept;`

- <sup>3</sup> *Returns:* The maximum value of `counter` that the implementation supports.

`constexpr explicit latch(ptrdiff_t expected);`

- <sup>4</sup> *Preconditions:* `expected >= 0` is true and `expected <= max()` is true.

- <sup>5</sup> *Effects:* Initializes `counter` with `expected`.

- <sup>6</sup> *Throws:* Nothing.

```

void count_down(ptrdiff_t update = 1);
7 Preconditions: update >= 0 is true, and update <= counter is true.
8 Effects: Atomically decrements counter by update. If counter is equal to zero, unblocks all threads
 blocked on *this.
9 Synchronization: Strongly happens before the returns from all calls that are unblocked.
10 Throws: system_error when an exception is required (33.2.2).
11 Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

bool try_wait() const noexcept;
12 Returns: With very low probability false. Otherwise counter == 0.

void wait() const;
13 Effects: If counter equals zero, returns immediately. Otherwise, blocks on *this until a call to
 count_down that decrements counter to zero.
14 Throws: system_error when an exception is required (33.2.2).
15 Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

void arrive_and_wait(ptrdiff_t update = 1);
16 Effects: Equivalent to:
 count_down(update);
 wait();

```

### 33.9.3 Barriers

[thread.barrier]

#### 33.9.3.1 General

[thread.barrier.general]

- <sup>1</sup> A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier.

[Note 1: A barrier is useful for managing repeated tasks that are handled by multiple threads. — end note]

#### 33.9.3.2 Header <barrier> synopsis

[barrier.syn]

```

namespace std {
 template<class CompletionFunction = see below>
 class barrier;
}

```

#### 33.9.3.3 Class template barrier

[thread.barrier.class]

```

namespace std {
 template<class CompletionFunction = see below>
 class barrier {
 public:
 using arrival_token = see below;

 static constexpr ptrdiff_t max() noexcept;

 constexpr explicit barrier(ptrdiff_t expected,
 CompletionFunction f = CompletionFunction());
 ~barrier();

 barrier(const barrier&) = delete;
 barrier& operator=(const barrier&) = delete;

 [[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);
 void wait(arrival_token&& arrival) const;

 void arrive_and_wait();
 void arrive_and_drop();

```

```

 private:
 CompletionFunction completion; // exposition only
 };
}

```

- 1 Each *barrier phase* consists of the following steps:
  - (1.1) — The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
  - (1.2) — Exactly once after the expected count reaches zero, a thread executes the completion step during its call to `arrive`, `arrive_and_drop`, or `wait`, except that it is implementation-defined whether the step executes if no thread calls `wait`.
  - (1.3) — When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.
- 2 Each phase defines a *phase synchronization point*. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run.
- 3 The *phase completion step* that is executed at the end of each phase has the following effects:
  - (3.1) — Invokes the completion function, equivalent to `completion()`.
  - (3.2) — Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

- 4 Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.
- 5 `CompletionFunction` shall meet the *Cpp17MoveConstructible* ([Table 31](#)) and *Cpp17Destructible* ([Table 35](#)) requirements. `is_nothrow_invocable_v<CompletionFunction>` shall be `true`.
- 6 The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the *Cpp17DefaultConstructible* requirements ([Table 30](#)) and `completion()` has no effects.
- 7 `barrier::arrival_token` is an unspecified type, such that it meets the *Cpp17MoveConstructible* ([Table 31](#)), *Cpp17MoveAssignable* ([Table 33](#)), and *Cpp17Destructible* ([Table 35](#)) requirements.

`static constexpr ptrdiff_t max() noexcept;`

- 8 *Returns*: The maximum expected count that the implementation supports.

`constexpr explicit barrier(ptrdiff_t expected,`  
 `CompletionFunction f = CompletionFunction());`

- 9 *Preconditions*: `expected >= 0` is `true` and `expected <= max()` is `true`.

- 10 *Effects*: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to `expected`. Initializes `completion` with `std::move(f)`. Starts the first phase.

[*Note 1*: If `expected` is 0 this object can only be destroyed. — *end note*]

- 11 *Throws*: Any exception thrown by `CompletionFunction`'s move constructor.

`[[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);`

- 12 *Preconditions*: `update > 0` is `true`, and `update` is less than or equal to the expected count for the current barrier phase.

- 13 *Effects*: Constructs an object of type `arrival_token` that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by `update`.

- 14 *Synchronization*: The call to `arrive` strongly happens before the start of the phase completion step for the current phase.

- 15 *Returns*: The constructed `arrival_token` object.

- 16 *Throws*: `system_error` when an exception is required ([33.2.2](#)).

17     *Error conditions:* Any of the error conditions allowed for mutex types (33.6.4.2).  
 18     *[Note 2:* This call can cause the completion step for the current phase to start. — end note]  
  
**void wait(arrival\_token&& arrival) const;**  
 19     *Preconditions:* `arrival` is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.  
 20     *Effects:* Blocks at the synchronization point associated with `std::move(arrival)` until the phase completion step of the synchronization point's phase is run.  
     *[Note 3:* If `arrival` is associated with the synchronization point for a previous phase, the call returns immediately. — end note]  
 21     *Throws:* `system_error` when an exception is required (33.2.2).  
 22     *Error conditions:* Any of the error conditions allowed for mutex types (33.6.4.2).  
  
**void arrive\_and\_wait();**  
 23     *Effects:* Equivalent to: `wait(arrive())`.  
  
**void arrive\_and\_drop();**  
 24     *Preconditions:* The expected count for the current barrier phase is greater than zero.  
 25     *Effects:* Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.  
 26     *Synchronization:* The call to `arrive_and_drop` strongly happens before the start of the phase completion step for the current phase.  
 27     *Throws:* `system_error` when an exception is required (33.2.2).  
 28     *Error conditions:* Any of the error conditions allowed for mutex types (33.6.4.2).  
 29     *[Note 4:* This call can cause the completion step for the current phase to start. — end note]

## 33.10 Futures

[futures]

### 33.10.1 Overview

[futures.overview]

<sup>1</sup> 33.10 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread.

[Note 1: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — end note]

### 33.10.2 Header <future> synopsis

[future.syn]

```
namespace std {
 enum class future_errc {
 broken.promise = implementation-defined,
 future.already_retrieved = implementation-defined,
 promise.already_satisfied = implementation-defined,
 no.state = implementation-defined
 };

 enum class launch : unspecified {
 async = unspecified,
 deferred = unspecified,
 implementation-defined
 };

 enum class future_status {
 ready,
 timeout,
 deferred
 };

 // 33.10.3, error handling
 template<> struct is_error_code_enum<future_errc> : public true_type { };
}
```

```

error_code make_error_code(future_errc e) noexcept;
error_condition make_error_condition(future_errc e) noexcept;

const error_category& future_category() noexcept;

// 33.10.4, class future_error
class future_error;

// 33.10.6, class template promise
template<class R> class promise;
template<class R> class promise<R&>;
template<> class promise<void>;

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>;

// 33.10.7, class template future
template<class R> class future;
template<class R> class future<R&>;
template<> class future<void>;

// 33.10.8, class template shared_future
template<class R> class shared_future;
template<class R> class shared_future<R&>;
template<> class shared_future<void>;

// 33.10.10, class template packaged_task
template<class> class packaged_task; // not defined
template<class R, class... ArgTypes>
class packaged_task<R(ArgTypes...)>;

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

// 33.10.9, function template async
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(launch policy, F&& f, Args&&... args);
}

```

<sup>1</sup> The enum type `launch` is a bitmask type (16.3.3.3) with elements `launch::async` and `launch::deferred`.  
 [Note 1: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend the behavior of the first overload of `async()` by adding their extensions to the launch policy under the “as if” rule. —end note]

<sup>2</sup> The enum values of `future_errc` are distinct and not zero.

### 33.10.3 Error handling

[**futures.errors**]

```

const error_category& future_category() noexcept;

1 Returns: A reference to an object of a type derived from class error_category.
2 The object’s default_error_condition and equivalent virtual functions shall behave as specified for
 the class error_category. The object’s name virtual function returns a pointer to the string "future".
 error_code make_error_code(future_errc e) noexcept;
3 Returns: error_code(static_cast<int>(e), future_category()).

```

```
error_condition make_error_condition(future_errc e) noexcept;
4 Returns: error_condition(static_cast<int>(e), future_category()).
```

### 33.10.4 Class future\_error

[**futures.future.error**]

```
namespace std {
 class future_error : public logic_error {
 public:
 explicit future_error(future_errc e);

 const error_code& code() const noexcept;
 const char* what() const noexcept;

 private:
 error_code ec_; // exposition only
 };
}

explicit future_error(future_errc e);
1 Effects: Initializes ec_ with make_error_code(e).

const error_code& code() const noexcept;
2 Returns: ec_.

const char* what() const noexcept;
3 Returns: An NTBS incorporating code().message().
```

### 33.10.5 Shared state

[**futures.state**]

- <sup>1</sup> Many of the classes introduced in subclause 33.10 use some state to communicate results. This *shared state* consists of some state information and some (possibly not yet evaluated) *result*, which can be a (possibly void) value or an exception.

[*Note 1*: Futures, promises, and tasks defined in this Clause reference such shared state. — *end note*]

- <sup>2</sup> [*Note 2*: The result can be any kind of object including a function to compute that result, as used by `async` when `policy` is `launch::deferred`. — *end note*]

- <sup>3</sup> An *asynchronous return object* is an object that reads results from a shared state. A *waiting function* of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (33.2.5), then it is a *timed waiting function*, otherwise it is a *non-timed waiting function*.

- <sup>4</sup> An *asynchronous provider* is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

[*Note 3*: Such as promises or tasks. — *end note*]

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

- <sup>5</sup> When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

- (5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and
- (5.2) — the return object or provider gives up its reference to its shared state; and
- (5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to `std::async`, the shared state is not yet ready, and this was the last reference to the shared state.

- <sup>6</sup> When an asynchronous provider is said to make its shared state ready, it means:

- (6.1) — first, the provider marks its shared state as ready; and
- (6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.

- <sup>7</sup> When an asynchronous provider is said to abandon its shared state, it means:

- (7.1) — first, if that state is not ready, the provider

- (7.1.1) — stores an exception object of type `future_error` with an error condition of `broken_promised` within its shared state; and then
  - (7.1.2) — makes its shared state ready;
  - (7.2) — second, the provider releases its shared state.
- 8 A shared state is *ready* only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.
- 9 Calls to functions that successfully set the stored result of a shared state synchronize with (6.9.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a waiting function on the shared state.
- 10 Some functions (e.g., `promise::set_value_at_thread_exit`) delay making the shared state ready until the calling thread exits. The destruction of each of that thread's objects with thread storage duration (6.7.5.3) is sequenced before making that shared state ready.
- 11 Access to the result of the same shared state may conflict (6.9.2).

[*Note 4*: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by `shared_future::get()` (33.10.8) must either use read-only operations or provide additional synchronization. — *end note*]

### 33.10.6 Class template promise

[**futures.promise**]

```
namespace std {
 template<class R>
 class promise {
 public:
 promise();
 template<class Allocator>
 promise(allocator_arg_t, const Allocator& a);
 promise(promise&& rhs) noexcept;
 promise(const promise&) = delete;
 ~promise();

 // assignment
 promise& operator=(promise&& rhs) noexcept;
 promise& operator=(const promise&) = delete;
 void swap(promise& other) noexcept;

 // retrieving the result
 future<R> get_future();

 // setting the result
 void set_value(see below);
 void set_exception(exception_ptr p);

 // setting the result with deferred notification
 void set_value_at_thread_exit(see below);
 void set_exception_at_thread_exit(exception_ptr p);
 };

 template<class R, class Alloc>
 struct uses_allocator<promise<R>, Alloc>;
}
```

- <sup>1</sup> For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.
- <sup>2</sup> The implementation provides the template `promise` and two specializations, `promise<R&>` and `promise<void>`. These differ only in the argument type of the member functions `set_value` and `set_value_at_thread_exit`, as set out in their descriptions, below.

- 3 The `set_value`, `set_exception`, `set_value_at_thread_exit`, and `set_exception_at_thread_exit` member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

```
template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>
: true_type { };
```

- 4 *Preconditions:* Alloc meets the Cpp17Allocator requirements (16.4.4.6.1).

```
promise();
template<class Allocator>
promise(allocator_arg_t, const Allocator& a);
```

- 5 *Effects:* Creates a shared state. The second constructor uses the allocator `a` to allocate memory for the shared state.

```
promise(promise&& rhs) noexcept;
```

- 6 *Effects:* Transfers ownership of the shared state of `rhs` (if any) to the newly-constructed object.

- 7 *Postconditions:* `rhs` has no shared state.

```
~promise();
```

- 8 *Effects:* Abandons any shared state (33.10.5).

```
promise& operator=(promise&& rhs) noexcept;
```

- 9 *Effects:* Abandons any shared state (33.10.5) and then as if `promise(std::move(rhs)).swap(*this)`.

- 10 *Returns:* `*this`.

```
void swap(promise& other) noexcept;
```

- 11 *Effects:* Exchanges the shared state of `*this` and `other`.

- 12 *Postconditions:* `*this` has the shared state (if any) that `other` had prior to the call to `swap`. `other` has the shared state (if any) that `*this` had prior to the call to `swap`.

```
future<R> get_future();
```

- 13 *Synchronization:* Calls to this function do not introduce data races (6.9.2) with calls to `set_value`, `set_exception`, `set_value_at_thread_exit`, or `set_exception_at_thread_exit`.

[Note 1: Such calls need not synchronize with each other. — end note]

- 14 *Returns:* A `future<R>` object with the same shared state as `*this`.

- 15 *Throws:* `future_error` if `*this` has no shared state or if `get_future` has already been called on a promise with the same shared state as `*this`.

- 16 *Error conditions:*

- (16.1) — `future_already_retrieved` if `get_future` has already been called on a promise with the same shared state as `*this`.

- (16.2) — `no_state` if `*this` has no shared state.

```
void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&>::set_value(R& r);
void promise<void>::set_value();
```

- 17 *Effects:* Atomically stores the value `r` in the shared state and makes that state ready (33.10.5).

- 18 *Throws:*

- (18.1) — `future_error` if its shared state already has a stored value or exception, or

- (18.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or

- (18.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

- 19 *Error conditions:*

- (19.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(19.2) — `no_state` if `*this` has no shared state.

```
void set_exception(exception_ptr p);
```

20     *Preconditions:* `p` is not null.

21     *Effects:* Atomically stores the exception pointer `p` in the shared state and makes that state ready (33.10.5).

22     *Throws:* `future_error` if its shared state already has a stored value or exception.

23     *Error conditions:*

(23.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(23.2) — `no_state` if `*this` has no shared state.

```
void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R&>::set_value_at_thread_exit(R& r);
void promise<void>::set_value_at_thread_exit();
```

24     *Effects:* Stores the value `r` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

25     *Throws:*

(25.1) — `future_error` if its shared state already has a stored value or exception, or

(25.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or

(25.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

26     *Error conditions:*

(26.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(26.2) — `no_state` if `*this` has no shared state.

```
void set_exception_at_thread_exit(exception_ptr p);
```

27     *Preconditions:* `p` is not null.

28     *Effects:* Stores the exception pointer `p` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

29     *Throws:* `future_error` if an error condition occurs.

30     *Error conditions:*

(30.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(30.2) — `no_state` if `*this` has no shared state.

```
template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;
```

31     *Effects:* As if by `x.swap(y)`.

### 33.10.7 Class template future

[**futures.unique.future**]

- 1 The class template `future` defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed `future` object has no shared state. A `future` object with shared state can be created by functions on asynchronous providers (33.10.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a `future` object can be set by calling a respective function on an object that shares the same shared state.

<sup>2</sup> [Note 1: Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`. — end note]

<sup>3</sup> The effect of calling any member function other than the destructor, the move assignment operator, `share`, or `valid` on a `future` object for which `valid() == false` is undefined.

[Note 2: It is valid to move from a `future` object for which `valid() == false`. — end note]

*Recommended practice:* Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
 template<class R>
 class future {
 public:
 future() noexcept;
 future(future&&) noexcept;
 future(const future&) = delete;
 ~future();
 future& operator=(const future&) = delete;
 future& operator=(future&&) noexcept;
 shared_future<R> share() noexcept;

 // retrieving the value
 see below get();

 // functions to check state
 bool valid() const noexcept;

 void wait() const;
 template<class Rep, class Period>
 future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
 template<class Clock, class Duration>
 future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
 };
}
```

- <sup>4</sup> For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.
- <sup>5</sup> The implementation provides the template `future` and two specializations, `future<R&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

`future() noexcept;`

- <sup>6</sup> *Effects:* The object does not refer to a shared state.

- <sup>7</sup> *Postconditions:* `valid() == false`.

`future(future&& rhs) noexcept;`

- <sup>8</sup> *Effects:* Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).

- <sup>9</sup> *Postconditions:*

- <sup>(9.1)</sup> — `valid()` returns the same value as `rhs.valid()` prior to the constructor invocation.

- <sup>(9.2)</sup> — `rhs.valid() == false`.

`~future();`

- <sup>10</sup> *Effects:*

- <sup>(10.1)</sup> — Releases any shared state ([33.10.5](#));

- <sup>(10.2)</sup> — destroys `*this`.

`future& operator=(future&& rhs) noexcept;`

- <sup>11</sup> *Effects:* If `addressof(rhs) == this` is true, there are no effects. Otherwise:

- <sup>(11.1)</sup> — Releases any shared state ([33.10.5](#)).

- <sup>(11.2)</sup> — move assigns the contents of `rhs` to `*this`.

- <sup>12</sup> *Postconditions:*

- <sup>(12.1)</sup> — `valid()` returns the same value as `rhs.valid()` prior to the assignment.

- <sup>(12.2)</sup> — If `addressof(rhs) == this` is false, `rhs.valid() == false`.

```

shared_future<R> share() noexcept;
13 Postconditions: valid() == false.
14 Returns: shared_future<R>(std::move(*this)).
15
R future::get();
R& future<R&>::get();
void future<void>::get();
16 [Note 3: As described above, the template and its two required specializations differ only in the return type
and return value of the member function get. —end note]
17 Effects:
18.1 — wait()s until the shared state is ready, then retrieves the value stored in the shared state;
18.2 — releases any shared state (33.10.5).
18.3
19 Postconditions: valid() == false.
20 Returns:
21.1 — future::get() returns the value v stored in the object's shared state as std::move(v).
21.2 — future<R&>::get() returns the reference stored as value in the object's shared state.
21.3 — future<void>::get() returns nothing.
22 Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;
23 Returns: true only if *this refers to a shared state.

void wait() const;
24 Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
25 Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the
shared state is ready or until the relative timeout (33.2.4) specified by rel_time has expired.
26 Returns:
27.1 — future_status::deferred if the shared state contains a deferred function.
27.2 — future_status::ready if the shared state is ready.
27.3 — future_status::timeout if the function is returning because the relative timeout (33.2.4) specified
 by rel_time has expired.
28 Throws: timeout-related exceptions (33.2.4).

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
29 Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the
shared state is ready or until the absolute timeout (33.2.4) specified by abs_time has expired.
30 Returns:
31.1 — future_status::deferred if the shared state contains a deferred function.
31.2 — future_status::ready if the shared state is ready.
31.3 — future_status::timeout if the function is returning because the absolute timeout (33.2.4)
 specified by abs_time has expired.
32 Throws: timeout-related exceptions (33.2.4).

```

### 33.10.8 Class template `shared_future`

[`futures.shared.future`]

<sup>1</sup> The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object

and shares its shared state with the original asynchronous provider (33.10.5) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.

<sup>2</sup> [Note 1: Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state. — end note]

<sup>3</sup> The effect of calling any member function other than the destructor, the move assignment operator, the copy assignment operator, or `valid()` on a `shared_future` object for which `valid() == false` is undefined.

[Note 2: It is valid to copy or move from a `shared_future` object for which `valid()` is `false`. — end note]

*Recommended practice:* Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
 template<class R>
 class shared_future {
 public:
 shared_future() noexcept;
 shared_future(const shared_future& rhs) noexcept;
 shared_future(future<R>&&) noexcept;
 shared_future(shared_future&& rhs) noexcept;
 ~shared_future();
 shared_future& operator=(const shared_future& rhs) noexcept;
 shared_future& operator=(shared_future&& rhs) noexcept;

 // retrieving the value
 see below get() const;

 // functions to check state
 bool valid() const noexcept;

 void wait() const;
 template<class Rep, class Period>
 future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
 template<class Clock, class Duration>
 future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
 };
}
```

<sup>4</sup> For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.

<sup>5</sup> The implementation provides the template `shared_future` and two specializations, `shared_future<R&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

`shared_future() noexcept;`

<sup>6</sup> *Effects:* The object does not refer to a shared state.

<sup>7</sup> *Postconditions:* `valid() == false`.

`shared_future(const shared_future& rhs) noexcept;`

<sup>8</sup> *Effects:* The object refers to the same shared state as `rhs` (if any).

<sup>9</sup> *Postconditions:* `valid()` returns the same value as `rhs.valid()`.

`shared_future(future<R>&& rhs) noexcept;`

`shared_future(shared_future&& rhs) noexcept;`

<sup>10</sup> *Effects:* Move constructs a `shared_future` object that refers to the shared state that was originally referred to by `rhs` (if any).

<sup>11</sup> *Postconditions:*

(11.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the constructor invocation.

(11.2) — `rhs.valid() == false`.

```

~shared_future();

12 Effects:
(12.1) — Releases any shared state (33.10.5);
(12.2) — destroys *this.

```

**shared\_future& operator=(shared\_future&& rhs) noexcept;**

```

13 Effects: If addressof(rhs) == this is true, there are no effects. Otherwise:
(13.1) — Releases any shared state (33.10.5);
(13.2) — move assigns the contents of rhs to *this.

```

**Postconditions:**

```

(14.1) — valid() returns the same value as rhs.valid() returned prior to the assignment.
(14.2) — If addressof(rhs) == this is false, rhs.valid() == false.

```

**shared\_future& operator=(const shared\_future& rhs) noexcept;**

```

15 Effects: If addressof(rhs) == this is true, there are no effects. Otherwise:
(15.1) — Releases any shared state (33.10.5);
(15.2) — assigns the contents of rhs to *this.

```

[Note 3: As a result, **\*this** refers to the same shared state as **rhs** (if any). — end note]

**Postconditions:** **valid() == rhs.valid()**.

```

const R& shared_future::get() const;
R& shared_future<R>::get() const;
void shared_future<void>::get() const;

```

**Note 4:** As described above, the template and its two required specializations differ only in the return type and return value of the member function **get**. — end note]

**Note 5:** Access to a value object stored in the shared state is unsynchronized, so operations on **R** might introduce a data race (6.9.2). — end note]

**Effects:** **wait()**s until the shared state is ready, then retrieves the value stored in the shared state.

**Returns:**

```

(20.1) — shared_future::get() returns a const reference to the value stored in the object's shared state.

```

[Note 6: Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the **shared\_future** object that returned the reference. — end note]

```

(20.2) — shared_future<R>::get() returns the reference stored as value in the object's shared state.
(20.3) — shared_future<void>::get() returns nothing.

```

**Throws:** The stored exception, if an exception was stored in the shared state.

```

bool valid() const noexcept;

```

**Returns:** **true** only if **\*this** refers to a shared state.

```

void wait() const;

```

**Effects:** Blocks until the shared state is ready.

```

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

```

**Effects:** None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the relative timeout (33.2.4) specified by **rel\_time** has expired.

**Returns:**

```

(25.1) — future_status::deferred if the shared state contains a deferred function.
(25.2) — future_status::ready if the shared state is ready.

```

(25.3) — `future_status::timeout` if the function is returning because the relative timeout (33.2.4) specified by `rel_time` has expired.

26     *Throws:* timeout-related exceptions (33.2.4).

```
template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

27     *Effects:* None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by `abs_time` has expired.

28     *Returns:*

(28.1) — `future_status::deferred` if the shared state contains a deferred function.

(28.2) — `future_status::ready` if the shared state is ready.

(28.3) — `future_status::timeout` if the function is returning because the absolute timeout (33.2.4) specified by `abs_time` has expired.

29     *Throws:* timeout-related exceptions (33.2.4).

### 33.10.9 Function template `async`

[`futures.async`]

1     The function template `async` provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a `future` object with which it shares a shared state.

```
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
 async(F&& f, Args&&... args);
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
 async(launch policy, F&& f, Args&&... args);
```

2     *Mandates:* The following are all `true`:

- (2.1) — `is_constructible_v<decay_t<F>, F>`,
- (2.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and
- (2.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

3     *Effects:* The first function behaves the same as a call to the second function with a `policy` argument of `launch::async` | `launch::deferred` and the same arguments for `F` and `Args`. The second function creates a shared state that is associated with the returned `future` object. The further behavior of the second function depends on the `policy` argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

(3.1) — If `launch::async` is set in `policy`, calls `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` (22.10.5, 33.4.3.3) as if in a new thread of execution represented by a `thread` object with the values produced by `auto` being materialized (7.3.5) in the thread that called `async`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` is stored as the exceptional result in the shared state. The `thread` object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.

(3.2) — If `launch::deferred` is set in `policy`, stores `auto(std::forward<F>(f))` and `auto(std::forward<Args>(args))...` in the shared state. These copies of `f` and `args` constitute a *deferred function*. Invocation of the deferred function evaluates `invoke(std::move(g), std::move(xyz))` where `g` is the stored value of `auto(std::forward<F>(f))` and `xyz` is the stored copy of `auto(std::forward<Args>(args))...`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (33.10.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of `invoke(std::move(g), std::move(xyz))` begins, the function is no longer considered deferred.

*Recommended practice:* If this policy is specified together with other policies, such as when using a `policy` value of `launch::async` | `launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited.

- (3.3) — If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

- 4     *Synchronization:* The invocation of `async` synchronizes with the invocation of `f`. The completion of the function `f` is sequenced before the shared state is made ready.

[*Note 1:* These apply regardless of the provided `policy` argument, and even if the corresponding `future` object is moved to another thread. However, it is possible for `f` not to be called at all, in which case its completion never happens. — *end note*]

If the implementation chooses the `launch::async` policy,

- (4.1) — a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out ([33.4.3.6](#));
- (4.2) — the associated thread completion synchronizes with ([6.9.2](#)) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

- 5     *Returns:* An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>...>>` that refers to the shared state created by this call to `async`.

[*Note 2:* If a future obtained from `async` is moved outside the local scope, the future's destructor can block for the shared state to become ready. — *end note*]

- 6     *Throws:* `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures cannot be allocated.

- 7     *Error conditions:*

- (7.1) — `resource_unavailable_try_again` — if `policy == launch::async` and the system is unable to start a new thread.

- 8     *[Example 1:*

```
int work1(int value);
int work2(int value);
int work(int value) {
 auto handle = std::async([=]{ return work2(value); });
 int tmp = work1(value);
 return tmp + handle.get(); // #1
}
```

[*Note 3:* Line #1 might not result in concurrency because the `async` call uses the default policy, which might use `launch::deferred`, in which case the lambda might not be invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency. — *end note*]

— *end example*]

### 33.10.10 Class template `packaged_task`

[**futures.task**]

#### 33.10.10.1 General

[**futures.task.general**]

- 1     The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.
- 2     When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```
namespace std {
 template<class> class packaged_task; // not defined

 template<class R, class... ArgTypes>
 class packaged_task<R(ArgTypes...)> {
 public:
 // construction and destruction
 packaged_task() noexcept;
```

```

template<class F>
 explicit packaged_task(F&& f);
~packaged_task();

// no copy
packaged_task(const packaged_task&) = delete;
packaged_task& operator=(const packaged_task&) = delete;

// move support
packaged_task(packaged_task&& rhs) noexcept;
packaged_task& operator=(packaged_task&& rhs) noexcept;
void swap(packaged_task& other) noexcept;

bool valid() const noexcept;

// result retrieval
future<R> get_future();

// execution
void operator()(ArgTypes...);
void make_ready_at_thread_exit(ArgTypes...);

void reset();
};

template<class R, class... ArgTypes>
 packaged_task(R (*)(ArgTypes...)) -> packaged_task<R(ArgTypes...)>;
template<class F> packaged_task(F) -> packaged_task<see below>;
}

```

### 33.10.10.2 Member functions

[[futures.task.members](#)]

`packaged_task()` noexcept;

1     *Effects*: The object has no shared state and no stored task.

2     *Constraints*: `remove_cvref_t<F>` is not the same type as `packaged_task<R(ArgTypes...)>`.

3     *Mandates*: `is_invocable_r_v<R, F&, ArgTypes...>` is true.

4     *Preconditions*: Invoking a copy of `f` behaves the same as invoking `f`.

5     *Effects*: Constructs a new `packaged_task` object with a shared state and initializes the object's stored task with `std::forward<F>(f)`.

6     *Throws*: Any exceptions thrown by the copy or move constructor of `f`, or `bad_alloc` if memory for the internal data structures cannot be allocated.

`template<class F> packaged_task(F) -> packaged_task<see below>;`

7     *Constraints*: `&F::operator()` is well-formed when treated as an unevaluated operand ([7.2.3](#)) and either

(7.1)     — `F::operator()` is a non-static member function and `decltype(&F::operator())` is either of the form `R(G::*)(A...)` *cv* `&opt` `noexcept_opt` or of the form `R(*)(G, A...)` `noexcept_opt` for a type `G`, or

(7.2)     — `F::operator()` is a static member function and `decltype(&F::operator())` is of the form `R(*)(A...)` `noexcept_opt`.

8     *Remarks*: The deduced type is `packaged_task<R(A...)>`.

`packaged_task(packaged_task&& rhs)` noexcept;

9     *Effects*: Transfers ownership of `rhs`'s shared state to `*this`, leaving `rhs` with no shared state. Moves the stored task from `rhs` to `*this`.

10     *Postconditions*: `rhs` has no shared state.

```

 packaged_task& operator=(packaged_task&& rhs) noexcept;
11 Effects:
(11.1) — Releases any shared state (33.10.5);
(11.2) — calls packaged_task(std::move(rhs)).swap(*this).
~packaged_task();

12 Effects: Abandons any shared state (33.10.5).

void swap(packaged_task& other) noexcept;
13 Effects: Exchanges the shared states and stored tasks of *this and other.
14 Postconditions: *this has the same shared state and stored task (if any) as other prior to the call to swap. other has the same shared state and stored task (if any) as *this prior to the call to swap.

bool valid() const noexcept;
15 Returns: true only if *this has a shared state.

future<R> get_future();
16 Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to operator() or make_ready_at_thread_exit.
[Note 1: Such calls need not synchronize with each other. — end note]
17 Returns: A future object that shares the same shared state as *this.
18 Throws: A future_error object if an error occurs.
19 Error conditions:
(19.1) — future_already_retrieved if get_future has already been called on a packaged_task object with the same shared state as *this.
(19.2) — no_state if *this has no shared state.

void operator()(ArgTypes... args);
20 Effects: As if by INVOKER(f, t1, t2, ..., tN) (22.10.4), where f is the stored task of *this and t1, t2, ..., tN are the values in args..... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. The shared state of *this is made ready, and any threads blocked in a function waiting for the shared state of *this to become ready are unblocked.
21 Throws: A future_error exception object if there is no shared state or the stored task has already been invoked.
22 Error conditions:
(22.1) — promise_already_satisfied if the stored task has already been invoked.
(22.2) — no_state if *this has no shared state.

void make_ready_at_thread_exit(ArgTypes... args);
23 Effects: As if by INVOKER(f, t1, t2, ..., tN) (22.10.4), where f is the stored task and t1, t2, ..., tN are the values in args..... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (33.10.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.
24 Throws: future_error if an error condition occurs.
25 Error conditions:
(25.1) — promise_already_satisfied if the stored task has already been invoked.
(25.2) — no_state if *this has no shared state.

```

```

void reset();

26 Effects: As if *this = packaged_task(std::move(f)), where f is the task stored in *this.
[Note 2: This constructs a new shared state for *this. The old state is abandoned (33.10.5). — end note]

27 Throws:
(27.1) — bad_alloc if memory for the new shared state cannot be allocated.
(27.2) — Any exception thrown by the move constructor of the task stored in the shared state.
(27.3) — future_error with an error condition of no_state if *this has no shared state.

```

### 33.10.10.3 Globals

[`futures.task.nonmembers`]

```

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;

1 Effects: As if by x.swap(y).

```

## 33.11 Safe reclamation

[`saferecl`]

### 33.11.1 General

[`saferecl.general`]

- Subclause 33.11 contains safe-reclamation techniques, which are most frequently used to straightforwardly resolve access-deletion races.

### 33.11.2 Read-copy update (RCU)

[`saferecl.rcu`]

#### 33.11.2.1 General

[`saferecl.rcu.general`]

- RCU is a synchronization mechanism that can be used for linked data structures that are frequently read, but seldom updated. RCU does not provide mutual exclusion, but instead allows the user to schedule specified actions such as deletion at some later time.
- A class type `T` is *rcu-protectable* if it has exactly one base class of type `rcu_obj_base<T, D>` for some `D`, and that base is public and non-virtual, and it has no base classes of type `rcu_obj_base<X, Y>` for any other combination `X, Y`. An object is *rcu-protectable* if it is of *rcu-protectable* type.
- An invocation of `unlock U` on an `rcu_domain dom` corresponds to an invocation of `lock L` on `dom` if `L` is sequenced before `U` and either
  - no other invocation of `lock` on `dom` is sequenced after `L` and before `U`, or
  - every invocation of `unlock U2` on `dom` such that `L` is sequenced before `U2` and `U2` is sequenced before `U` corresponds to an invocation of `lock L2` on `dom` such that `L` is sequenced before `L2` and `L2` is sequenced before `U2`.

[Note 1: This pairs nested locks and unlocks on a given domain in each thread. — end note]

- A *region of RCU protection* on a domain `dom` starts with a `lock L` on `dom` and ends with its corresponding `unlock U`.
- Given a region of RCU protection `R` on a domain `dom` and given an evaluation `E` that scheduled another evaluation `F` in `dom`, if `E` does not strongly happen before the start of `R`, the end of `R` strongly happens before evaluating `F`.
- The evaluation of a scheduled evaluation is potentially concurrent with any other scheduled evaluation. Each scheduled evaluation is evaluated at most once.

#### 33.11.2.2 Header <rcu> synopsis

[`rcu.syn`]

```

namespace std {
 // 33.11.2.3, class template rcu_obj_base
 template<class T, class D = default_delete<T>> class rcu_obj_base;

 // 33.11.2.4, class rcu_domain
 class rcu_domain;

 // 33.11.2.4.3 non-member functions
 rcu_domain& rcu_default_domain() noexcept;
 void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;
 void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;
}

```

```
template<class T, class D = default_delete<T>>
void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());
}
```

### 33.11.2.3 Class template `rcu_obj_base`

[`saferecl.rcu.base`]

- <sup>1</sup> Objects of type T to be protected by RCU inherit from a specialization `rcu_obj_base<T, D>` for some D.

```
namespace std {
 template<class T, class D = default_delete<T>>
 class rcu_obj_base {
 public:
 void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;
 protected:
 rcu_obj_base() = default;
 rcu_obj_base(const rcu_obj_base&) = default;
 rcu_obj_base(rcu_obj_base&&) = default;
 rcu_obj_base& operator=(const rcu_obj_base&) = default;
 rcu_obj_base& operator=(rcu_obj_base&&) = default;
 ~rcu_obj_base() = default;
 private:
 D deleter; // exposition only
 };
}
```

- <sup>2</sup> The behavior of a program that adds specializations for `rcu_obj_base` is undefined.

- <sup>3</sup> T may be an incomplete type. It shall be complete before any member of the resulting specialization of `rcu_obj_base` is referenced.

- <sup>4</sup> D shall be a function object type (22.10) for which, given a value d of type D and a value ptr of type T\*, the expression `d(ptr)` is valid.

- <sup>5</sup> D shall meet the requirements for *Cpp17DefaultConstructible* and *Cpp17MoveAssignable*.

- <sup>6</sup> If D is trivially copyable, all specializations of `rcu_obj_base<T, D>` are trivially copyable.

`void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;`

<sup>7</sup> *Mandates:* T is an rcu-protectable type.

<sup>8</sup> *Preconditions:* `*this` is a base class subobject of an object x of type T. The member function `rcu_obj_base<T, D>::retire` was not invoked on x before. The assignment to `deleter` does not exit via an exception.

<sup>9</sup> *Effects:* Evaluates `deleter = std::move(d)` and schedules the evaluation of the expression `deleter(addressof(x))` in the domain dom; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in dom.

[*Note 1:* If such evaluations acquire resources held across any invocation of `retire` on dom, deadlock can occur.  
—end note]

### 33.11.2.4 Class `rcu_domain`

[`saferecl.rcu.domain`]

#### 33.11.2.4.1 General

[`saferecl.rcu.domain.general`]

```
namespace std {
 class rcu_domain {
 public:
 rcu_domain(const rcu_domain&) = delete;
 rcu_domain& operator=(const rcu_domain&) = delete;

 void lock() noexcept;
 bool try_lock() noexcept;
 void unlock() noexcept;
 };
}
```

- <sup>1</sup> This class meets the requirements of *Cpp17Lockable* (33.2.5.3) and provides regions of RCU protection.

[*Example 1:*

```
std::scoped_lock<rcu_domain> rlock(rcu_default_domain());
```

— end example]

- 2 The functions `lock` and `unlock` establish (possibly nested) regions of RCU protection.

### 33.11.2.4.2 Member functions

[`saferecl.rcu.domain.members`]

```
void lock() noexcept;
```

1 *Effects*: Opens a region of RCU protection.

2 *Remarks*: Calls to `lock` do not introduce a data race (6.9.2.2) involving `*this`.

```
bool try_lock() noexcept;
```

3 *Effects*: Equivalent to `lock()`.

4 *Returns*: `true`.

```
void unlock() noexcept;
```

5 *Preconditions*: A call to `lock` that opened an unclosed region of RCU protection is sequenced before the call to `unlock`.

6 *Effects*: Closes the unclosed region of RCU protection that was most recently opened. May invoke scheduled evaluations in `*this`.

7 [Note 1: If such evaluations acquire resources held across any invocation of `unlock` on `*this`, deadlock can occur. — end note]

8 *Remarks*: Calls to `unlock` do not introduce a data race involving `*this`.

[Note 2: Evaluation of scheduled evaluations can still cause a data race. — end note]

### 33.11.2.4.3 Non-member functions

[`saferecl.rcu.domain.func`]

```
rcu_domain& rcu_default_domain() noexcept;
```

1 *Returns*: A reference to a static-duration object of type `rcu_domain`. A reference to the same object is returned every time this function is called.

```
void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;
```

2 *Effects*: If the call to `rcu_synchronize` does not strongly happen before the lock opening an RCU protection region `R` on `dom`, blocks until the `unlock` closing `R` happens.

3 *Synchronization*: The `unlock` closing `R` strongly happens before the return from `rcu_synchronize`.

```
void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;
```

4 *Effects*: May evaluate any scheduled evaluations in `dom`. For any evaluation that happens before the call to `rcu_barrier` and that schedules an evaluation `E` in `dom`, blocks until `E` has been evaluated.

5 *Synchronization*: The evaluation of any such `E` strongly happens before the return from `rcu_barrier`.

[Note 1: A call to `rcu_barrier` does not imply a call to `rcu_synchronize` and vice versa. — end note]

```
template<class T, class D = default_delete<T>>
```

```
void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());
```

6 *Mandates*: `is_move_constructible_v<D>` is true and the expression `d(p)` is well-formed.

7 *Preconditions*: `D` meets the `Cpp17MoveConstructible` and `Cpp17Destructible` requirements.

8 *Effects*: May allocate memory. It is unspecified whether the memory allocation is performed by invoking `operator new`. Initializes an object `d1` of type `D` from `std::move(d)`. Schedules the evaluation of `d1(p)` in the domain `dom`; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in `dom`.

[Note 2: If `rcu_retire` exits via an exception, no evaluation is scheduled. — end note]

9 *Throws*: `bad_alloc` or any exception thrown by the initialization of `d1`.

10 [Note 3: If scheduled evaluations acquire resources held across any invocation of `rcu_retire` on `dom`, deadlock can occur. — end note]

### 33.11.3 Hazard pointers

[**saferecl.hp**]

#### 33.11.3.1 General

[**saferecl.hp.general**]

- <sup>1</sup> A hazard pointer is a single-writer multi-reader pointer that can be owned by at most one thread at any time. Only the owner of the hazard pointer can set its value, while any number of threads may read its value. The owner thread sets the value of a hazard pointer to point to an object in order to indicate to concurrent threads—which may delete such an object—that the object is not yet safe to delete.
- <sup>2</sup> A class type  $T$  is *hazard-protectable* if it has exactly one base class of type `hazard_pointer_obj_base<T, D>` for some  $D$ , that base is public and non-virtual, and it has no base classes of type `hazard_pointer_obj_base<T2, D2>` for any other combination  $T2, D2$ . An object is *hazard-protectable* if it is of hazard-protectable type.
- <sup>3</sup> The time span between creation and destruction of a hazard pointer  $h$  is partitioned into a series of *protection epochs*; in each protection epoch,  $h$  either is *associated* with a hazard-protectable object, or is *unassociated*. Upon creation, a hazard pointer is unassociated. Changing the association (possibly to the same object) initiates a new protection epoch and ends the preceding one.
- <sup>4</sup> An object  $x$  of hazard-protectable type  $T$  is *retired* with a deleter of type  $D$  when the member function `hazard_pointer_obj_base<T, D>::retire` is invoked on  $x$ . Any given object  $x$  shall be retired at most once.
- <sup>5</sup> A retired object  $x$  is *reclaimed* by invoking its deleter with a pointer to  $x$ ; the behavior is undefined if that invocation exits via an exception.
- <sup>6</sup> A hazard-protectable object  $x$  is *possibly-reclaimable* with respect to an evaluation  $A$  if:

- (6.1) —  $x$  is not reclaimed; and
- (6.2) —  $x$  is retired in an evaluation  $R$  and  $A$  does not happen before  $R$ ; and
- (6.3) — for all hazard pointers  $h$  and for every protection epoch  $E$  of  $h$  during which  $h$  is associated with  $x$ :
  - (6.3.1) — if the beginning of  $E$  happens before  $R$ , the end of  $E$  strongly happens before  $A$ ; and
  - (6.3.2) — if  $E$  began by an evaluation of `try_protect` with argument `src`, label its atomic load operation  $L$ . If there exists an atomic modification  $B$  on `src` such that  $L$  observes a modification that is modification-ordered before  $B$ , and  $B$  happens before  $x$  is retired, the end of  $E$  strongly happens before  $A$ .

[*Note 1*: In typical use, a store to `src` sequenced before retiring  $x$  will be such an atomic operation  $B$ . — *end note*]

[*Note 2*: The latter two conditions convey the informal notion that a protection epoch that began before retiring  $x$ , as implied either by the happens-before relation or the coherence order of some source, delays the reclamation of  $x$ . — *end note*]

- <sup>7</sup> The number of possibly-reclaimable objects has an unspecified bound.

[*Note 3*: The bound can be a function of the number of hazard pointers, the number of threads that retire objects, and the number of threads that use hazard pointers. — *end note*]

[*Example 1*: The following example shows how hazard pointers allow updates to be carried out in the presence of concurrent readers. The object of type `hazard_pointer` in `print_name` protects the object `*ptr` from being reclaimed by `ptr->retire` until the end of the protection epoch.

```
struct Name : public hazard_pointer_obj_base<Name> { /* details */ };
atomic<Name*> name;
// called often and in parallel!
void print_name() {
 hazard_pointer h = make_hazard_pointer();
 Name* ptr = h.protect(name); // Protection epoch starts
 // ... safe to access *ptr
}
// Protection epoch ends.

// called rarely, but possibly concurrently with print_name
void update_name(Name* new_name) {
 Name* ptr = name.exchange(new_name);
 ptr->retire();
}
— end example
```

## 33.11.3.2 Header &lt;hazard\_pointer&gt; synopsis

[hazard.pointer.syn]

```
namespace std {
 // 33.11.3.3, class template hazard_pointer_obj_base
 template<class T, class D = default_delete<T>> class hazard_pointer_obj_base;

 // 33.11.3.4, class hazard_pointer
 class hazard_pointer;

 // 33.11.3.4.4, non-member functions
 hazard_pointer make_hazard_pointer();
 void swap(hazard_pointer&, hazard_pointer&) noexcept;
}
```

## 33.11.3.3 Class template hazard\_pointer\_obj\_base

[saferecl.hp.base]

```
namespace std {
 template<class T, class D = default_delete<T>>
 class hazard_pointer_obj_base {
 public:
 void retire(D d = D()) noexcept;
 protected:
 hazard_pointer_obj_base() = default;
 hazard_pointer_obj_base(const hazard_pointer_obj_base&) = default;
 hazard_pointer_obj_base(hazard_pointer_obj_base&&) = default;
 hazard_pointer_obj_base& operator=(const hazard_pointer_obj_base&) = default;
 hazard_pointer_obj_base& operator=(hazard_pointer_obj_base&&) = default;
 ~hazard_pointer_obj_base() = default;
 private:
 D deleter; // exposition only
 };
}
```

<sup>1</sup> D shall be a function object type (22.10.4) for which, given a value d of type D and a value ptr of type T\*, the expression d(ptr) is valid.

<sup>2</sup> The behavior of a program that adds specializations for `hazard_pointer_obj_base` is undefined.

<sup>3</sup> D shall meet the requirements for *Cpp17DefaultConstructible* and *Cpp17MoveAssignable*.

<sup>4</sup> T may be an incomplete type. It shall be complete before any member of the resulting specialization of `hazard_pointer_obj_base` is referenced.

`void retire(D d = D()) noexcept;`

<sup>5</sup> *Mandates:* T is a hazard-protectable type.

<sup>6</sup> *Preconditions:* `*this` is a base class subobject of an object x of type T. x is not retired. Move-assigning d to `deleter` does not exit via an exception.

<sup>7</sup> *Effects:* Move-assigns d to `deleter`, thereby setting it as the deleter of x, then retires x. May reclaim possibly-reclaimable objects.

## 33.11.3.4 Class hazard\_pointer

[saferecl.hp.holder]

## 33.11.3.4.1 General

[saferecl.hp.holder.general]

```
namespace std {
 class hazard_pointer {
 public:
 hazard_pointer() noexcept;
 hazard_pointer(hazard_pointer&&) noexcept;
 hazard_pointer& operator=(hazard_pointer&&) noexcept;
 ~hazard_pointer();

 [[nodiscard]] bool empty() const noexcept;
 template<class T> T* protect(const atomic<T*>& src) noexcept;
 template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;
 template<class T> void reset_protection(const T* ptr) noexcept;
 void reset_protection(nullptr_t = nullptr) noexcept;
 };
}
```

```

 void swap(hazard_pointer&) noexcept;
 };
}

```

- 1 An object of type `hazard_pointer` is either empty or *owns* a hazard pointer. Each hazard pointer is owned by exactly one object of type `hazard_pointer`.

[*Note 1*: An empty `hazard_pointer` object is different from a `hazard_pointer` object that owns an unassociated hazard pointer. An empty `hazard_pointer` object does not own any hazard pointers. — *end note*]

### 33.11.3.4.2 Constructors, destructor, and assignment

[`saferecl.hp.holder.ctor`]

```
hazard_pointer() noexcept;
```

- 1 *Postconditions*: `*this` is empty.

```
hazard_pointer(hazard_pointer&& other) noexcept;
```

- 2 *Postconditions*: If `other` is empty, `*this` is empty. Otherwise, `*this` owns the hazard pointer originally owned by `other`; `other` is empty.

```
~hazard_pointer();
```

- 3 *Effects*: If `*this` is not empty, destroys the hazard pointer owned by `*this`, thereby ending its current protection epoch.

```
hazard_pointer& operator=(hazard_pointer&& other) noexcept;
```

- 4 *Effects*: If `this == &other` is true, no effect. Otherwise, if `*this` is not empty, destroys the hazard pointer owned by `*this`, thereby ending its current protection epoch.

- 5 *Postconditions*: If `other` was empty, `*this` is empty. Otherwise, `*this` owns the hazard pointer originally owned by `other`. If `this != &other` is true, `other` is empty.

- 6 *Returns*: `*this`.

### 33.11.3.4.3 Member functions

[`saferecl.hp.holder.mem`]

```
[[nodiscard]] bool empty() const noexcept;
```

- 1 *Returns*: true if and only if `*this` is empty.

```
template<class T> T* protect(const atomic<T*>& src) noexcept;
```

- 2 *Effects*: Equivalent to:

```

T* ptr = src.load(memory_order::relaxed);
while (!try_protect(ptr, src)) {}
return ptr;

```

```
template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;
```

- 3 *Mandates*: `T` is a hazard-protectable type.

- 4 *Preconditions*: `*this` is not empty.

- 5 *Effects*: Performs the following steps in order:

- (5.1) — Initializes a variable `old` of type `T*` with the value of `ptr`.
- (5.2) — Evaluates `reset_protection(old)`.
- (5.3) — Assigns the value of `src.load(memory_order::acquire)` to `ptr`.
- (5.4) — If `old == ptr` is false, evaluates `reset_protection()`.

- 6 *Returns*: `old == ptr`.

```
template<class T> void reset_protection(const T* ptr) noexcept;
```

- 7 *Mandates*: `T` is a hazard-protectable type.

- 8 *Preconditions*: `*this` is not empty.

- 9 *Effects*: If `ptr` is a null pointer value, invokes `reset_protection()`. Otherwise, associates the hazard pointer owned by `*this` with `*ptr`, thereby ending the current protection epoch.

- 10 *Complexity*: Constant.

```

void reset_protection(nullptr_t = nullptr) noexcept;
11 Preconditions: *this is not empty.
12 Postconditions: The hazard pointer owned by *this is unassociated.
13 Complexity: Constant.

void swap(hazard_pointer& other) noexcept;
14 Effects: Swaps the hazard pointer ownership of this object with that of other.
[Note 1: The owned hazard pointers, if any, remain unchanged during the swap and continue to be associated
with the respective objects that they were protecting before the swap, if any. No protection epochs are ended or
initiated. —end note]
15 Complexity: Constant.

```

### 33.11.3.4.4 Non-member functions

[**saferecl.hp.holder.nonmem**]

```
hazard_pointer make_hazard_pointer();
```

- 1 *Effects:* Constructs a hazard pointer.
- 2 *Returns:* A **hazard\_pointer** object that owns the newly-constructed hazard pointer.
- 3 *Throws:* May throw **bad\_alloc** if memory for the hazard pointer could not be allocated.

```
void swap(hazard_pointer& a, hazard_pointer& b) noexcept;
```

- 4 *Effects:* Equivalent to a.swap(b).

# Annex A (informative)

## Grammar summary [gram]

### A.1 General

[gram.general]

- <sup>1</sup> This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.9, 9.2, 6.5.2) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

### A.2 Keywords

[gram.key]

- <sup>1</sup> New context-dependent keywords are introduced into a program by `typedef` (9.2.4), `namespace` (9.8.2), `class` (Clause 11), `enumeration` (9.7.1), and `template` (Clause 13) declarations.

```

typedef-name:

# Annex B (normative)

## Implementation quantities [implimits]

- <sup>1</sup> Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.
- <sup>2</sup> The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.
  - (2.1) — Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
  - (2.2) — Nesting levels of conditional inclusion (15.2) [256].
  - (2.3) — Pointer (9.3.4.2), pointer-to-member (9.3.4.4), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a type in a declaration [256].
  - (2.4) — Nesting levels of parenthesized expressions (7.5.3) within a full-expression [256].
  - (2.5) — Number of characters in an internal identifier (5.10) or macro name (15.6) [1 024].
  - (2.6) — Number of characters in an external identifier (5.10, 6.6) [1 024].
  - (2.7) — External identifiers (6.6) in one translation unit [65 536].
  - (2.8) — Identifiers with block scope declared in one block (6.4.3) [1 024].
  - (2.9) — Structured bindings (9.6) introduced in one declaration [256].
  - (2.10) — Macro identifiers (15.6) simultaneously defined in one translation unit [65 536].
  - (2.11) — Parameters in one function definition (9.5.1) [256].
  - (2.12) — Arguments in one function call (7.6.1.3) [256].
  - (2.13) — Parameters in one macro definition (15.6) [256].
  - (2.14) — Arguments in one macro invocation (15.6) [256].
  - (2.15) — Characters in one logical source line (5.2) [65 536].
  - (2.16) — Characters in a *string-literal* (5.13.5) (after concatenation (5.2)) [65 536].
  - (2.17) — Size of an object (6.7.2) [262 144].
  - (2.18) — Nesting levels for #include files (15.3) [256].
  - (2.19) — Case labels for a switch statement (8.5.3) (excluding those for any nested switch statements) [16 384].
  - (2.20) — Non-static data members (including inherited ones) in a single class (11.4) [16 384].
  - (2.21) — Lambda-captures in one lambda-expression (7.5.5.3) [256].
  - (2.22) — Enumeration constants in a single enumeration (9.7.1) [4 096].
  - (2.23) — Levels of nested class definitions (11.4.12) in a single member-specification [256].
  - (2.24) — Functions registered by atexit() (17.5) [32].
  - (2.25) — Functions registered by at\_quick\_exit() (17.5) [32].
  - (2.26) — Direct and indirect base classes (11.7) [16 384].
  - (2.27) — Direct base classes for a single class (11.7) [1 024].
  - (2.28) — Class members declared in a single member-specification (including member functions) (11.4) [4 096].
  - (2.29) — Final overriding virtual functions in a class, accessible or not (11.7.3) [16 384].
  - (2.30) — Direct and indirect virtual bases of a class (11.7.2) [1 024].

- (2.31) — Static data members of a class (11.4.9.3) [1 024].
- (2.32) — Friend declarations in a class (11.8.4) [4 096].
- (2.33) — Access control declarations in a class (11.8.2) [4 096].
- (2.34) — Member initializers in a constructor definition (11.9.3) [6 144].
- (2.35) — *initializer-clauses* in one *braced-init-list* (9.4) [16 384].
- (2.36) — Scope qualifications of one identifier (7.5.4.3) [256].
- (2.37) — Nested *linkage-specifications* (9.11) [1 024].
- (2.38) — Recursive constexpr function invocations (9.2.6) [512].
- (2.39) — Full-expressions evaluated within a core constant expression (7.7) [1 048 576].
- (2.40) — Template parameters in a template declaration (13.2) [1 024].
- (2.41) — Recursively nested template instantiations (13.9.2), including substitution during template argument deduction (13.10.3) [1 024].
- (2.42) — Handlers per try block (14.4) [256].
- (2.43) — Number of placeholders (22.10.15.5) [10].
- (2.44) — Number of hazard-protectable possibly-reclaimable objects (33.11.3.1) [256].

# Annex C (informative)

## Compatibility [diff]

### C.1 C++ and ISO C++ 2023

[diff.cpp23]

#### C.1.1 General

[diff.cpp23.general]

- <sup>1</sup> Subclause C.1 lists the differences between C++ and ISO C++ 2023 (ISO/IEC 14882:2023, *Programming Languages — C++*), by the chapters of this document.

#### C.1.2 Clause 7: expressions

[diff.cpp23.expr]

- <sup>1</sup> Affected subclause: 9.4.5

**Change:** Pointer comparisons between `initializer_list` objects' backing arrays are unspecified.

**Rationale:** Permit the implementation to store backing arrays in static read-only memory.

**Effect on original feature:** Valid C++ 2023 code that relies on the result of pointer comparison between backing arrays may change behavior. For example:

```
bool ne(std::initializer_list<int> a, std::initializer_list<int> b) {
 return a.begin() != b.begin() + 1;
}
bool b = ne({2,3}, {1,2,3}); // unspecified result; previously false
```

#### C.1.3 Clause 16: library introduction

[diff.cpp23.library]

- <sup>1</sup> Affected subclause: 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<hazard_pointer>` (33.11.3.2), `<rcu>` (33.11.2.2), and `<text_encoding>` (30.6.1). Valid C++ 2023 code that `#includes` headers with these names may be invalid in this revision of C++.

#### C.1.4 Clause 23: strings library

[diff.cpp23.strings]

- <sup>1</sup> Affected subclause: 23.4.5

**Change:** Output of floating-point overloads of `to_string` and `to_wstring`.

**Rationale:** Prevent loss of information and improve consistency with other formatting facilities.

**Effect on original feature:** `to_string` and `to_wstring` function calls that take floating-point arguments may produce a different output. For example:

```
auto s = std::to_string(1e-7); // "1e-07"
 // previously "0.000000" with '.' possibly
 // changed according to the global C locale
```

### C.2 C++ and ISO C++ 2020

[diff.cpp20]

#### C.2.1 General

[diff.cpp20.general]

- <sup>1</sup> Subclause C.2 lists the differences between C++ and ISO C++ 2020 (ISO/IEC 14882:2020, *Programming Languages — C++*), by the chapters of this document.

#### C.2.2 Clause 5: lexical conventions

[diff.cpp20.lex]

- <sup>1</sup> Affected subclause: 5.10

**Change:** Previously valid identifiers containing characters not present in UAX #44 properties XID\_Start or XID\_Continue, or not in Normalization Form C, are now rejected.

**Rationale:** Prevent confusing characters in identifiers. Requiring normalization of names ensures consistent linker behavior.

**Effect on original feature:** Some identifiers are no longer well-formed.

- <sup>2</sup> Affected subclause: 5.13.5

**Change:** Concatenated *string-literals* can no longer have conflicting *encoding-prefixes*.

**Rationale:** Removal of unimplemented conditionally-supported feature.

**Effect on original feature:** Concatenation of *string-literals* with different *encoding-prefixes* is now ill-formed. For example:

```
auto c = L"a" U"b"; // was conditionally-supported; now ill-formed
```

### C.2.3 Clause 7: expressions

[diff.cpp20.expr]

<sup>1</sup> **Affected subclause:** 7.5.4.2

**Change:** Change move-eligible *id-expressions* from lvalues to xvalues.

**Rationale:** Simplify the rules for implicit move.

**Effect on original feature:** Valid C++ 2020 code that relies on a returned *id-expression*'s being an lvalue may change behavior or fail to compile. For example:

```
decltype(auto) f(int&& x) { return (x); } // returns int&&; previously returned int&
int& g(int&& x) { return x; } // ill-formed; previously well-formed
```

<sup>2</sup> **Affected subclause:** 7.6.1.2

**Change:** Change the meaning of comma in subscript expressions.

**Rationale:** Enable repurposing a deprecated syntax to support multidimensional indexing.

**Effect on original feature:** Valid C++ 2020 code that uses a comma expression within a subscript expression may fail to compile. For example:

```
arr[1, 2] // was equivalent to arr[(1, 2)],
 // now equivalent to arr.operator[](1, 2) or ill-formed
```

### C.2.4 Clause 8: statements

[diff.cpp20.stmt]

<sup>1</sup> **Affected subclause:** 8.6.5

**Change:** The lifetime of temporary objects in the *for-range-initializer* is extended until the end of the loop (6.7.7).

**Rationale:** Improve usability of the range-based **for** statement.

**Effect on original feature:** Destructors of some temporary objects are invoked later. For example:

```
void f() {
 std::vector<int> v = { 42, 17, 13 };
 std::mutex m;

 for (int x :
 static_cast<void*>(std::lock_guard<std::mutex>(m)), v) { // lock released in C++ 2020
 std::lock_guard<std::mutex> guard(m); // OK in C++ 2020, now deadlocks
 }
}
```

### C.2.5 Clause 9: declarations

[diff.cpp20.dcl]

<sup>1</sup> **Affected subclause:** 9.4.3

**Change:** UTF-8 string literals may initialize arrays of **char** or **unsigned char**.

**Rationale:** Compatibility with previously written code that conformed to previous versions of this document.

**Effect on original feature:** Arrays of **char** or **unsigned char** may now be initialized with a UTF-8 string literal. This can affect initialization that includes arrays that are directly initialized within class types, typically aggregates. For example:

```
struct A {
 char8_t s[10];
};

struct B {
 char s[10];
};

void f(A);
void f(B);

int main() {
 f({u8""}); // ambiguous
}
```

**C.2.6 Clause 13: templates**

[diff.cpp20.temp]

- <sup>1</sup>
- Affected subclause:
- [13.10.3.6](#)

**Change:** Deducing template arguments from exception specifications.

**Rationale:** Facilitate generic handling of throwing and non-throwing functions.

**Effect on original feature:** Valid ISO C++ 2020 code may be ill-formed in this revision of C++. For example:

```
template<bool> struct A { };
template<bool B> void f(void (*)(A) noexcept(B));
void g(A<false>) noexcept;
void h() {
 f(g); // ill-formed; previously well-formed
}
```

**C.2.7 Clause 16: library introduction**

[diff.cpp20.library]

- <sup>1</sup>
- Affected subclause:
- [16.4.2.3](#)

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<expected>` ([22.8.2](#)), `<flat_map>` ([24.6.4](#)), `<flat_set>` ([24.6.5](#)), `<generator>` ([26.8.2](#)), `<mdspan>` ([24.7.3.2](#)), `<print>` ([31.7.4](#)), `<spanstream>` ([31.9.2](#)), `<stacktrace>` ([19.6.2](#)), `<stdatomic.h>` ([33.5.12](#)), and `<stdfloat>` ([17.4.2](#)). Valid C++ 2020 code that `#includes` headers with these names may be invalid in this revision of C++.

**C.2.8 Clause 18: concepts library**

[diff.cpp20.concepts]

- <sup>1</sup>
- Affected subclauses:
- [17.11.4](#)
- ,
- [18.5.4](#)
- , and
- [18.5.5](#)

**Change:** Replace `common_reference_with` in `three_way_comparable_with`, `equality_comparable_with`, and `totally_ordered_with` with an exposition-only concept.

**Rationale:** Allow uncopyable, but movable, types to model these concepts.

**Effect on original feature:** Valid C++ 2020 code relying on subsumption with `common_reference_with` may fail to compile in this revision of C++. For example:

```
template<class T, class U>
 requires equality_comparable_with<T, U>
bool attempted_equals(const T&, const U& u); // previously selected overload

template<class T, class U>
 requires common_reference_with<const remove_reference_t<T>&, const remove_reference_t<U>&>
bool attempted_equals(const T& t, const U& u); // ambiguous overload; previously
 // rejected by partial ordering
bool test(shared_ptr<int> p) {
 return attempted_equals(p, nullptr); // ill-formed; previously well-formed
}
```

**C.2.9 Clause 20: memory management library**

[diff.cpp20.memory]

- <sup>1</sup>
- Affected subclause:
- [20.2.9.1](#)

**Change:** Forbid partial and explicit program-defined specializations of `allocator_traits`.

**Rationale:** Allow addition of `allocate_at_least` to `allocator_traits`, and potentially other members in the future.

**Effect on original feature:** Valid C++ 2020 code that partially or explicitly specializes `allocator_traits` is ill-formed with no diagnostic required in this revision of C++.

**C.2.10 Clause 22: general utilities library**

[diff.cpp20.utilities]

- <sup>1</sup>
- Affected subclause:
- [22.14](#)

**Change:** Signature changes: `format`, `format_to`, `vformat_to`, `format_to_n`, `formatted_size`. Removal of `format_args_t`.

**Rationale:** Improve safety via compile-time format string checks, avoid unnecessary template instantiations.

**Effect on original feature:** Valid C++ 2020 code that contained errors in format strings or relied on previous format string signatures or `format_args_t` may become ill-formed. For example:

```
auto s = std::format("{:d}", "I am not a number"); // ill-formed,
 // previously threw format_error
```

## 2 Affected subclause: 22.14

**Change:** Signature changes: `format`, `format_to`, `format_to_n`, `formatted_size`.

**Rationale:** Enable formatting of views that do not support iteration when const-qualified and that are not copyable.

**Effect on original feature:** Valid C++ 2020 code that passes bit-fields to formatting functions may become ill-formed. For example:

```
struct tiny {
 int bit: 1;
};

auto t = tiny();
std::format("{}", t.bit); // ill-formed, previously returned "0"
```

## 3 Affected subclause: 22.14.2.2

**Change:** Restrict types of formatting arguments used as *width* or *precision* in a `std-format-spec`.

**Rationale:** Disallow types that do not have useful or portable semantics as a formatting width or precision.

**Effect on original feature:** Valid C++ 2020 code that passes a boolean or character type as *arg-id* becomes invalid. For example:

```
std::format("{:.*{}\"", "", true); // ill-formed, previously returned "*"
std::format("{:.*{}\"", "", '1'); // ill-formed, previously returned an
 // implementation-defined number of '*' characters
```

## 4 Affected subclause: 22.14.6.3

**Change:** Removed the `formatter` specialization:

```
template<size_t N> struct formatter<const char[N], charT>;
```

**Rationale:** The specialization is inconsistent with the design of `formatter`, which is intended to be instantiated only with cv-unqualified object types.

**Effect on original feature:** Valid C++ 2020 code that instantiated the removed specialization can become ill-formed.

## C.2.11 Clause 23: strings library

[diff.cpp20.strings]

## 1 Affected subclause: 23.4

**Change:** Additional rvalue overload for the `substr` member function and the corresponding constructor.

**Rationale:** Improve efficiency of operations on rvalues.

**Effect on original feature:** Valid C++ 2020 code that created a substring by calling `substr` (or the corresponding constructor) on an xvalue expression with type `S` that is a specialization of `basic_string` may change meaning in this revision of C++. For example:

```
std::string s1 = "some long string that forces allocation", s2 = s1;
std::move(s1).substr(10, 5);
assert(s1 == s2); // unspecified, previously guaranteed to be true
std::string s3(std::move(s2), 10, 5);
assert(s1 == s2); // unspecified, previously guaranteed to be true
```

## C.2.12 Clause 24: containers library

[diff.cpp20.containers]

## 1 Affected subclauses: 24.2.7 and 24.2.8

**Change:** Heterogeneous `extract` and `erase` overloads for associative containers.

**Rationale:** Improve efficiency of erasing elements from associative containers.

**Effect on original feature:** Valid C++ 2020 code may fail to compile in this revision of C++. For example:

```
struct B {
 auto operator<=>(const B&) const = default;
};

struct D : private B {
 void f(std::set<B, std::less<>>& s) {
 s.erase(*this); // ill-formed; previously well-formed
 }
};
```

**C.2.13 Clause 33: concurrency support library**

[diff.cpp20.thread]

**1 Affected subclause: 33.9.3**

**Change:** In this revision of C++, it is implementation-defined whether a barrier's phase completion step runs if no thread calls `wait`. Previously the phase completion step was guaranteed to run on the last thread that calls `arrive` or `arrive_and_drop` during the phase. In this revision of C++, it can run on any of the threads that arrived or waited at the barrier during the phase.

**Rationale:** Correct contradictory wording and improve implementation flexibility for performance.

**Effect on original feature:** Valid C++ 2020 code using a barrier might have different semantics in this revision of C++ if it depends on a completion function's side effects occurring exactly once, on a specific thread running the phase completion step, or on a completion function's side effects occurring without `wait` having been called. For example:

```
auto b0 = std::barrier(1);
b0.arrive();
b0.arrive(); // implementation-defined; previously well-defined

int data = 0;
auto b1 = std::barrier(1, [&] { data++; });
b1.arrive();
assert(data == 1); // implementation-defined; previously well-defined
b1.arrive(); // implementation-defined; previously well-defined
```

**C.3 C++ and ISO C++ 2017**

[diff.cpp17]

**C.3.1 General**

[diff.cpp17.general]

**1 Subclause C.3 lists the differences between C++ and ISO C++ 2017 (ISO/IEC 14882:2017, *Programming Languages — C++*), by the chapters of this document.****C.3.2 Clause 5: lexical conventions**

[diff.cpp17.lex]

**1 Affected subclauses: 5.4, 10.1, 10.3, 15.1, 15.4, and 15.5**

**Change:** New identifiers with special meaning.

**Rationale:** Required for new features.

**Effect on original feature:** Logical lines beginning with `module` or `import` may be interpreted differently in this revision of C++. For example:

```
class module {};
module m1; // was variable declaration; now module-declaration
module *m2; // variable declaration

class import {};
import j1; // was variable declaration; now module-import-declaration
::import j2; // variable declaration
```

**2 Affected subclause: 5.8**

**Change:** `header-name` tokens are formed in more contexts.

**Rationale:** Required for new features.

**Effect on original feature:** When the identifier `import` is followed by a < character, a `header-name` token may be formed. For example:

```
template<typename> class import {};
import<int> f(); // ill-formed; previously well-formed
::import<int> g(); // OK
```

**3 Affected subclause: 5.11**

**Change:** New keywords.

**Rationale:** Required for new features.

- (3.1) — The `char8_t` keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
- (3.2) — The `concept` keyword is added to enable the definition of concepts (13.7.9).
- (3.3) — The `consteval` keyword is added to declare immediate functions (9.2.6).
- (3.4) — The `constinit` keyword is added to prevent unintended dynamic initialization (9.2.7).
- (3.5) — The `co_await`, `co_yield`, and `co_return` keywords are added to enable the definition of coroutines (9.5.4).

- (3.6) — The `requires` keyword is added to introduce constraints through a *requires-clause* (13.1) or a *requires-expression* (7.5.7).

**Effect on original feature:** Valid C++ 2017 code using `char8_t`, `concept`, `consteval`, `constinit`, `co_await`, `co_yield`, `co_return`, or `requires` as an identifier is not valid in this revision of C++.

<sup>4</sup> **Affected subclause:** 5.12

**Change:** New operator `<=`.

**Rationale:** Necessary for new functionality.

**Effect on original feature:** Valid C++ 2017 code that contains a `<=` token immediately followed by a `>` token may be ill-formed or have different semantics in this revision of C++. For example:

```
namespace N {
 struct X {};
 bool operator<=(X, X);
 template<bool(X, X)> struct Y {};
 Y<operator<=> y; // ill-formed; previously well-formed
}
```

<sup>5</sup> **Affected subclause:** 5.13

**Change:** Type of UTF-8 string and character literals.

**Rationale:** Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.

**Effect on original feature:** Valid C++ 2017 code that depends on UTF-8 string literals having type “array of `const char`” and UTF-8 character literals having type “`char`” is not valid in this revision of C++. For example:

```
const auto *u8s = u8"text"; // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s; // ill-formed; previously well-formed

auto u8c = u8'c'; // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c; // ill-formed; previously well-formed

std::string s = u8"text"; // ill-formed; previously well-formed

void f(const char *s);
f(u8"text"); // ill-formed; previously well-formed

template<typename> struct ct;
template<> struct ct<char> {
 using type = char;
};
ct<decltype(u8'c')>::type x; // ill-formed; previously well-formed.
```

### C.3.3 Clause 6: basics

[diff.cpp17.basic]

<sup>1</sup> **Affected subclause:** 6.7.3

**Change:** A pseudo-destructor call ends the lifetime of the object to which it is applied.

**Rationale:** Increase consistency of the language model.

**Effect on original feature:** Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++. For example:

```
int f() {
 int a = 123;
 using T = int;
 a.~T();
 return a; // undefined behavior; previously returned 123
}
```

<sup>2</sup> **Affected subclause:** 6.9.2.2

**Change:** Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.

**Rationale:** Removal of rarely used and confusing feature.

**Effect on original feature:** If a `memory_order_release` atomic store is followed by a `memory_order_relaxed` store to the same variable by the same thread, then reading the latter value with a `memory_order_-`

`acquire` load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

### C.3.4 Clause 7: expressions

[diff.cpp17.expr]

<sup>1</sup> **Affected subclause:** 7.5.5.3

**Change:** Implicit lambda capture may capture additional entities.

**Rationale:** Rule simplification, necessary to resolve interactions with `constexpr` if.

**Effect on original feature:** Lambdas with a *capture-default* may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.

### C.3.5 Clause 9: declarations

[diff.cpp17.dcl.dcl]

<sup>1</sup> **Affected subclause:** 9.2.4

**Change:** Unnamed classes with a `typedef` name for linkage purposes can contain only C-compatible constructs.

**Rationale:** Necessary for implementability.

**Effect on original feature:** Valid C++ 2017 code may be ill-formed in this revision of C++. For example:

```
typedef struct {
 void f() {} // ill-formed; previously well-formed
} S;
```

<sup>2</sup> **Affected subclause:** 9.3.4.7

**Change:** A function cannot have different default arguments in different translation units.

**Rationale:** Required for modules support.

**Effect on original feature:** Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required. For example:

```
// Translation unit 1
int f(int a = 42);
int g() { return f(); }

// Translation unit 2
int f(int a = 76) { return a; } // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); } // used to return 42
```

<sup>3</sup> **Affected subclause:** 9.4.2

**Change:** A class that has user-declared constructors is never an aggregate.

**Rationale:** Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.

**Effect on original feature:** Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++. For example:

```
struct A { // not an aggregate; previously an aggregate
 A() = delete;
};

struct B { // not an aggregate; previously an aggregate
 B() = default;
 int i = 0;
};

struct C { // not an aggregate; previously an aggregate
 C(C&&) = default;
 int a, b;
};

A a{}; // ill-formed; previously well-formed
B b = {1}; // ill-formed; previously well-formed
auto* c = new C{2, 3}; // ill-formed; previously well-formed

struct Y;
```

```

struct X {
 operator Y();
};

struct Y { // not an aggregate; previously an aggregate
 Y(const Y&) = default;
 X x;
};

Y y{X{}}; // copy constructor call; previously aggregate-initialization

```

## 4 Affected subclause: 9.4.5

**Change:** Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.

**Rationale:** Catches bugs.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```
bool y[] = { "bc" }; // ill-formed; previously well-formed
```

## C.3.6 Clause 11: classes

[diff.cpp17.class]

## 1 Affected subclauses: 11.4.5 and 11.4.8.3

**Change:** The class name can no longer be used parenthesized immediately after an *explicit decl-specifier* in a constructor declaration. The *conversion-function-id* can no longer be used parenthesized immediately after an *explicit decl-specifier* in a conversion function declaration.

**Rationale:** Necessary for new functionality.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```

struct S {
 explicit (S)(const S&); // ill-formed; previously well-formed
 explicit (operator int)(); // ill-formed; previously well-formed
 explicit(true) (S)(int); // OK
};

```

## 2 Affected subclauses: 11.4.5 and 11.4.7

**Change:** A *simple-template-id* is no longer valid as the *declarator-id* of a constructor or destructor.

**Rationale:** Remove potentially error-prone option for redundancy.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```

template<class T>
struct A {
 A<T>(); // error: simple-template-id not allowed for constructor
 A(int); // OK, injected-class-name used
 ~A<T>(); // error: simple-template-id not allowed for destructor
};

```

## 3 Affected subclause: 11.9.6

**Change:** A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.

**Rationale:** Side effect of making it easier to write more efficient code that takes advantage of moves.

**Effect on original feature:** Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++. For example:

```

struct base {
 base();
 base(base const &);

private:
 base(base &&);

};

struct derived : base {};

base f(base b) {
 throw b; // error: base(base &&) is private
 derived d;
 return d; // error: base(base &&) is private
}

```

```

struct S {
 S(const char *s) : m(s) { }
 S(const S&) = default;
 S(S&& other) : m(other.m) { other.m = nullptr; }
 const char * m;
};

S consume(S&& s) { return s; }

void g() {
 S s("text");
 consume(static_cast<S&&>(s));
 char c = *s.m; // undefined behavior; previously ok
}

```

### C.3.7 Clause 12: overloading

[diff.cpp17.over]

<sup>1</sup> Affected subclause: [12.2.2.3](#)

**Change:** Equality and inequality expressions can now find reversed and rewritten candidates.

**Rationale:** Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.

**Effect on original feature:** For certain pairs of types where one is convertible to the other, equality or inequality expressions between an object of one type and an object of the other type invoke a different operator. Also, for certain types, equality or inequality expressions between two objects of that type become ambiguous. For example:

```

struct A {
 operator int() const;
};

bool operator==(A, int); // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
 return (x == y) + // ill-formed; previously well-formed
 (10 == x) + // calls #1, previously selected #2
 (10 != x); // calls #1, previously selected #3
}

```

<sup>2</sup> Affected subclause: [12.2.2.3](#)

**Change:** Overload resolution may change for equality operators ([7.6.10](#)).

**Rationale:** Support calling `operator==` with reversed order of arguments.

**Effect on original feature:** Valid C++ 2017 code that uses equality operators with conversion functions may be ill-formed or have different semantics in this revision of C++. For example:

```

struct A {
 operator int() const { return 10; }

 bool operator==(A, int); // #1
 // #2 is built-in candidate: bool operator==(int, int);
 bool b = 10 == A(); // calls #1 with reversed order of arguments; previously selected #2

 struct B {
 bool operator==(const B&); // member function with no cv-qualifier
 };
 B b1;
 bool eq = (b1 == b1); // ambiguous; previously well-formed
}

```

### C.3.8 Clause 13: templates

[diff.cpp17.temp]

<sup>1</sup> Affected subclause: [13.3](#)

**Change:** An *unqualified-id* that is followed by a < and for which name lookup finds nothing or finds a function will be treated as a *template-name* in order to potentially cause argument dependent lookup to be

performed.

**Rationale:** It was problematic to call a function template with an explicit template argument list via argument dependent lookup because of the need to have a template with the same name visible via normal lookup.

**Effect on original feature:** Previously valid code that uses a function name as the left operand of a `<` operator would become ill-formed. For example:

```
struct A {};
bool operator<(void (*fp)(), A);
void f() {}
int main() {
 A a;
 f < a; // ill-formed; previously well-formed
 (f) < a; // still well-formed
}
```

### C.3.9 Clause 14: exception handling

[diff.cpp17.exception]

- <sup>1</sup> Affected subclause: [14.5](#)

**Change:** Remove `throw()` exception specification.

**Rationale:** Removal of obsolete feature that has been replaced by `noexcept`.

**Effect on original feature:** A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses `throw()` for its exception specification will be rejected as ill-formed in this revision of C++. It should simply be replaced with `noexcept` for no change of meaning since C++ 2017.

[*Note 1:* There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — *end note*]

### C.3.10 Clause 16: library introduction

[diff.cpp17.library]

- <sup>1</sup> Affected subclause: [16.4.2.3](#)

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<barrier>` ([33.9.3.2](#)), `<bit>` ([22.15.2](#)), `<charconv>` ([22.13.1](#)), `<compare>` ([17.11.1](#)), `<concepts>` ([18.3](#)), `<coroutine>` ([17.12.2](#)), `<format>` ([22.14.1](#)), `<latch>` ([33.9.2.2](#)), `<numbers>` ([28.8.1](#)), `<ranges>` ([26.2](#)), `<semaphore>` ([33.8.2](#)), `<source_location>` ([17.8.1](#)), `<span>` ([24.7.2.1](#)), `<stop_token>` ([33.3.2](#)), `<syncstream>` ([31.11.1](#)), and `<version>` ([17.3.1](#)). Valid C++ 2017 code that `#includes` headers with these names may be invalid in this revision of C++.

- <sup>2</sup> Affected subclause: [16.4.2.3](#)

**Change:** Remove vacuous C++ header files.

**Rationale:** The empty headers implied a false requirement to achieve C compatibility with the C++ headers.

**Effect on original feature:** A valid C++ 2017 program that `#includes` any of the following headers may fail to compile: `<ccomplex>`, `<ciso646>`, `<cstdalign>`, `<cstdbool>`, and `<ctgmath>`. To retain the same behavior:

- (2.1) — a `#include` of `<ccomplex>` can be replaced by a `#include` of `<complex>` ([28.4.2](#)),
- (2.2) — a `#include` of `<ctgmath>` can be replaced by a `#include` of `<cmath>` ([28.7.1](#)) and a `#include` of `<complex>`, and
- (2.3) — a `#include` of `<ciso646>`, `<cstdalign>`, or `<cstdbool>` can simply be removed.

### C.3.11 Clause 24: containers library

[diff.cpp17.containers]

- <sup>1</sup> Affected subclauses: [24.3.9](#) and [24.3.10](#)

**Change:** Return types of `remove`, `remove_if`, and `unique` changed from `void` to `container::size_type`.

**Rationale:** Improve efficiency and convenience of finding number of removed elements.

**Effect on original feature:** Code that depends on the return types might have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

**C.3.12 Clause 25: iterators library**

[diff.cpp17.iterators]

1 **Affected subclause:** 25.3.2.3

**Change:** The specialization of `iterator_traits` for `void*` and for function pointer types no longer contains any nested typedefs.

**Rationale:** Corrects an issue misidentifying pointer types that are not incrementable as iterator types.

**Effect on original feature:** A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.

**C.3.13 Clause 27: algorithms library**

[diff.cpp17.alg.reqs]

1 **Affected subclause:** 27.2

**Change:** The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.

**Rationale:** Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.

**Effect on original feature:** A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

**C.3.14 Clause 31: input/output library**

[diff.cpp17.input.output]

1 **Affected subclause:** 31.7.5.3.3

**Change:** Character array extraction only takes array types.

**Rationale:** Increase safety via preventing buffer overflow at compile time.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p; // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q; // OK
```

2 **Affected subclause:** 31.7.6.3.4

**Change:** Overload resolution for ostream inserters used with UTF-8 literals.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2017 code that passes UTF-8 literals to `basic_ostream<char, ...>::operator<<` or `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed. For example:

```
std::cout << u8"text"; // previously called operator<<(const char*) and printed a string;
 // now ill-formed
std::cout << u8'X'; // previously called operator<<(char) and printed a character;
 // now ill-formed
```

3 **Affected subclause:** 31.7.6.3.4

**Change:** Overload resolution for ostream inserters used with `wchar_t`, `char16_t`, or `char32_t` types.

**Rationale:** Removal of surprising behavior.

**Effect on original feature:** Valid C++ 2017 code that passes `wchar_t`, `char16_t`, or `char32_t` characters or strings to `basic_ostream<char, ...>::operator<<` or that passes `char16_t` or `char32_t` characters or strings to `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed. For example:

```
std::cout << u"text"; // previously formatted the string as a pointer value;
 // now ill-formed
std::cout << u'X'; // previously formatted the character as an integer value;
 // now ill-formed
```

4 **Affected subclause:** 31.12.6

**Change:** Return type of filesystem path format observer member functions.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this revision of C++. For example:

```
std::filesystem::path p;
std::string s1 = p.u8string(); // ill-formed; previously well-formed
std::string s2 = p.generic_u8string(); // ill-formed; previously well-formed
```

**C.3.15 Annex D: compatibility features**

[diff.cpp17.depr]

- <sup>1</sup> **Change:** Remove `uncaught_exception`.

**Rationale:** The function did not have a clear specification when multiple exceptions were active, and has been superseded by `uncaught_exceptions`.

**Effect on original feature:** A valid C++ 2017 program that calls `std::uncaught_exception` may fail to compile. It can be revised to use `std::uncaught_exceptions` instead, for clear and portable semantics.

- <sup>2</sup> **Change:** Remove support for adaptable function API.

**Rationale:** The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with `decltype`, and by the `std::bind` and `std::not_fn` function templates.

**Effect on original feature:** A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.

- <sup>3</sup> **Change:** Remove redundant members from `std::allocator`.

**Rationale:** `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.

**Effect on original feature:** A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.

- <sup>4</sup> **Change:** Remove `raw_storage_iterator`.

**Rationale:** The iterator encouraged use of potentially-throwing algorithms, but did not return the number of elements successfully constructed, as would be necessary to destroy them.

**Effect on original feature:** A valid C++ 2017 program that uses this iterator class may fail to compile.

- <sup>5</sup> **Change:** Remove temporary buffers API.

**Rationale:** The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.

**Effect on original feature:** A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

- <sup>6</sup> **Change:** Remove `shared_ptr::unique`.

**Rationale:** The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well-defined use in single-threaded cases.

**Effect on original feature:** A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

- <sup>7</sup> **Affected subclause:** [D.18](#)

**Change:** Remove deprecated type traits.

**Rationale:** The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that did not directly support function types. It has been superseded by the `invoke_result` trait.

**Effect on original feature:** A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

**C.4 C++ and ISO C++ 2014**

[diff.cpp14]

**C.4.1 General**

[diff.cpp14.general]

- <sup>1</sup> Subclause [C.4](#) lists the differences between C++ and ISO C++ 2014 (ISO/IEC 14882:2014, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

**C.4.2 Clause 5: lexical conventions**

[diff.cpp14.lex]

- <sup>1</sup> **Affected subclause:** [5.2](#)

**Change:** Removal of trigraph support as a required feature.

**Rationale:** Prevents accidental uses of trigraphs in non-raw string literals and comments.

**Effect on original feature:** Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from input source file characters to the translation character set.

2 **Affected subclause:** 5.9

**Change:** *pp-number* can contain p *sign* and P *sign*.

**Rationale:** Necessary to enable *hexadecimal-floating-point-literals*.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like 0p+0 and 0e1\_p+0 are three separate tokens each in C++ 2014, but one single token in this revision of C++. For example:

```
#define F(a) b ## a
int b0p = F(0p+0); // ill-formed; equivalent to "int b0p = b0p + 0;" in C++ 2014
```

#### C.4.3 Clause 7: expressions

[diff.cpp14.expr]

1 **Affected subclauses:** 7.6.1.6 and 7.6.2.3

**Change:** Remove increment operator with *bool* operand.

**Rationale:** Obsolete feature with occasionally surprising semantics.

**Effect on original feature:** A valid C++ 2014 expression utilizing the increment operator on a *bool* lvalue is ill-formed in this revision of C++.

2 **Affected subclauses:** 7.6.2.8 and 7.6.2.9

**Change:** Dynamic allocation mechanism for over-aligned types.

**Rationale:** Simplify use of over-aligned types.

**Effect on original feature:** In C++ 2014 code that uses a *new-expression* to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, ::operator *new*(std::size\_t) is used to allocate the memory. In this revision of C++, ::operator *new*(std::size\_t, std::align\_val\_t) is used instead.

#### C.4.4 Clause 9: declarations

[diff.cpp14.dcl.dcl]

1 **Affected subclause:** 9.2.2

**Change:** Removal of *register storage-class-specifier*.

**Rationale:** Enable repurposing of deprecated keyword in future revisions of C++.

**Effect on original feature:** A valid C++ 2014 declaration utilizing the *register storage-class-specifier* is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.

2 **Affected subclause:** 9.2.9.6

**Change:** *auto* deduction from *braced-init-list*.

**Rationale:** More intuitive deduction behavior.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```
auto x1{1}; // was std::initializer_list<int>, now int
auto x2{1, 2}; // was std::initializer_list<int>, now ill-formed
```

3 **Affected subclause:** 9.3.4.6

**Change:** Make exception specifications be part of the type system.

**Rationale:** Improve type-safety.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or change meaning in this revision of C++. For example:

```
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2); // ill-formed; previously well-formed
```

4 **Affected subclause:** 9.4.2

**Change:** Definition of an aggregate is extended to apply to user-defined types with base classes.

**Rationale:** To increase convenience of aggregate initialization.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types. For example:

```
struct derived;
```

```

struct base {
 friend struct derived;
private:
 base();
};

struct derived : base {};

derived d1{}; // error; the code was well-formed in C++ 2014
derived d2; // still OK

```

**C.4.5 Clause 11: classes**

[diff.cpp14.class]

- <sup>1</sup>
- Affected subclause:**
- [11.9.4](#)

**Change:** Inheriting a constructor no longer injects a constructor into the derived class.

**Rationale:** Better interaction with other language features.

**Effect on original feature:** Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A *using-declaration* that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors. For example:

```

struct A {
 template<typename T> A(T, typename T::type = 0);
 A(int);
};

struct B : A {
 using A::A;
 B(int);
};

B b(42L); // now calls B(int), used to call B<long>(long),
 // which called A(int) due to substitution failure
 // in A<long>(long).

```

**C.4.6 Clause 13: templates**

[diff.cpp14.temp]

- <sup>1</sup>
- Affected subclause:**
- [13.10.3.6](#)

**Change:** Allowance to deduce from the type of a non-type template argument.

**Rationale:** In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. For example:

```

template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
 foo(p); // ill-formed; previously well-formed
}

```

**C.4.7 Clause 14: exception handling**

[diff.cpp14.except]

- <sup>1</sup>
- Affected subclause:**
- [14.5](#)

**Change:** Remove dynamic exception specifications.

**Rationale:** Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.

**Effect on original feature:** A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls `terminate` rather than `unexpected`, and it is unspecified whether stack unwinding is performed prior to such a call.

**C.4.8 Clause 16: library introduction**

[diff.cpp14.library]

- <sup>1</sup>
- Affected subclause:**
- [16.4.2.3](#)

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: <any> (22.7.2), <charconv> (22.13.1), <execution> (22.12.2), <filesystem> (31.12.4), <memory\_resource> (20.4.1), <optional> (22.5.2), <string\_view> (23.3.2), and <variant> (22.6.2). Valid C++ 2014 code that #includes headers with these names may be invalid in this revision of C++.

<sup>2</sup> **Affected subclause:** 16.4.5.2.3

**Change:** New reserved namespaces.

**Rationale:** Reserve namespaces for future revisions of the standard library that might otherwise be incompatible with existing programs.

**Effect on original feature:** The global namespaces std followed by an arbitrary sequence of digits (5.10) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., std2, may be invalid in this revision of C++.

#### C.4.9 Clause 22: general utilities library

[diff.cpp14.utilities]

<sup>1</sup> **Affected subclause:** 22.10.17

**Change:** Constructors taking allocators removed.

**Rationale:** No implementation consensus.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a std::function with an allocator is ill-formed and uses-allocator construction will not pass an allocator to std::function constructors in this revision of C++.

<sup>2</sup> **Affected subclause:** 20.3.2.2

**Change:** Different constraint on conversions from unique\_ptr.

**Rationale:** Adding array support to shared\_ptr, via the syntax shared\_ptr<T[]> and shared\_ptr<T[N]>.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr)); // error: int(*)[] is not compatible with int*
```

#### C.4.10 Clause 23: strings library

[diff.cpp14.string]

<sup>1</sup> **Affected subclause:** 23.4.3

**Change:** Non-const .data() member added.

**Rationale:** The lack of a non-const .data() differed from the similar member of std::vector. This change regularizes behavior.

**Effect on original feature:** Overloaded functions which have differing code paths for char\* and const char\* arguments will execute differently when called with a non-const string's .data() member in this revision of C++. For example:

```
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data()); // ill-formed; previously well-formed
```

#### C.4.11 Clause 24: containers library

[diff.cpp14.containers]

<sup>1</sup> **Affected subclause:** 24.2.7

**Change:** Requirements change:

**Rationale:** Increase portability, clarification of associative container requirements.

**Effect on original feature:** Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++. For example:

```
#include <set>

struct compare
{
 bool operator()(int a, int b)
 {
 return a < b;
 }
};
```

```
int main() {
 const std::set<int, compare> s;
 s.find(0);
}
```

#### C.4.12 Annex D: compatibility features

[diff.cpp14.depr]

- <sup>1</sup> **Change:** The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.

**Rationale:** Superseded by new features.

**Effect on original feature:** Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.

- <sup>2</sup> **Change:** Remove old iostreams members [depr.ios.members].

**Rationale:** Redundant feature for compatibility with pre-standard code has served its time.

**Effect on original feature:** A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

### C.5 C++ and ISO C++ 2011

[diff.cpp11]

#### C.5.1 General

[diff.cpp11.general]

- <sup>1</sup> Subclause C.5 lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

#### C.5.2 Clause 5: lexical conventions

[diff.cpp11.lex]

- <sup>1</sup> **Affected subclause:** 5.9

**Change:** *pp-number* can contain one or more single quotes.

**Rationale:** Necessary to enable single quotes as digit separators.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a *character-literal* in C++ 2011, whereas they are digit separators in this revision of C++. For example:

```
#define M(x, ...) __VA_ARGS__
int x[2] = { M('1'2,3'4, 5) };
// int x[2] = { 5 }; — C++ 2011
// int x[2] = { 3'4, 5 }; — this revision of C++
```

#### C.5.3 Clause 6: basics

[diff.cpp11.basic]

- <sup>1</sup> **Affected subclause:** 6.7.5.3

**Change:** New usual (non-placement) deallocator.

**Rationale:** Required for sized deallocation.

**Effect on original feature:** Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this revision of C++, however, the declaration of `operator delete` might match a predefined usual (non-placement) `operator delete` (6.7.5.5). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (7.6.2.8).

#### C.5.4 Clause 7: expressions

[diff.cpp11.expr]

- <sup>1</sup> **Affected subclause:** 7.6.16

**Change:** A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.

**Rationale:** Formerly mandated conversions (lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.

**Effect on original feature:** Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++. For example:

```

struct S {
 int x = 1;
 void mf() { x = 2; }
};

int f(bool cond) {
 S s;
 (cond ? s : throw 0).mf();
 return s.x;
}

```

In C++ 2011, `f(true)` returns 1. In this revision of C++, it returns 2.

```
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this revision of C++, it yields `sizeof(const char[1])`.

### C.5.5 Clause 9: declarations

[diff.cpp11.dcl.dcl]

- <sup>1</sup> Affected subclause: [9.2.6](#)

**Change:** `constexpr` non-static member functions are not implicitly `const` member functions.

**Rationale:** Necessary to allow `constexpr` member functions to mutate the object.

**Effect on original feature:** Valid C++ 2011 code may fail to compile in this revision of C++. For example:

```

struct S {
 constexpr const int &f();
 int &f();
};

```

This code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types.

- <sup>2</sup> Affected subclause: [9.4.2](#)

**Change:** Classes with default member initializers can be aggregates.

**Rationale:** Necessary to allow default member initializers to be used by aggregate initialization.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example:

```

struct S { // Aggregate in C++ 2014 onwards.
 int m = 1;
};

struct X {
 operator int();
 operator S();
};

X a{};
S b{a}; // uses copy constructor in C++ 2011,
 // performs aggregate initialization in this revision of C++

```

### C.5.6 Clause 16: library introduction

[diff.cpp11.library]

- <sup>1</sup> Affected subclause: [16.4.2.3](#)

**Change:** New header.

**Rationale:** New functionality.

**Effect on original feature:** The C++ header `<shared_mutex>` ([33.6.3](#)) is new. Valid C++ 2011 code that `#includes` a header with that name may be invalid in this revision of C++.

### C.5.7 Clause 31: input/output library

[diff.cpp11.input.output]

- <sup>1</sup> Affected subclause: [31.13](#)

**Change:** `gets` is not defined.

**Rationale:** Use of `gets` is considered dangerous.

**Effect on original feature:** Valid C++ 2011 code that uses the `gets` function may fail to compile in this revision of C++.

**C.6 C++ and ISO C++ 2003**

[diff.cpp03]

**C.6.1 General**

[diff.cpp03.general]

- <sup>1</sup> Subclause C.6 lists the differences between C++ and ISO C++ 2003 (ISO/IEC 14882:2003, *Programming Languages — C++*), in addition to those listed above, by the chapters of this document.

**C.6.2 Clause 5: lexical conventions**

[diff.cpp03.lex]

- <sup>1</sup> **Affected subclause:** 5.4

**Change:** New kinds of *string-literals*.**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a *string-literal* but will be interpreted as part of the *string-literal*. For example:

```
#define u8 "abc"
const char* s = u8"def"; // Previously "abcdef", now "def"
```

- <sup>2</sup> **Affected subclause:** 5.4

**Change:** User-defined literal string support.**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
#define _x "there"
"hello"_x // #1
```

Previously, #1 would have consisted of two separate preprocessing tokens and the macro \_x would have been expanded. In this revision of C++, #1 consists of a single preprocessing token, so the macro is not expanded.

- <sup>3</sup> **Affected subclause:** 5.11

**Change:** New keywords.**Rationale:** Required for new features.

**Effect on original feature:** Added to Table 5, the following identifiers are new keywords: alignas, alignof, char16\_t, char32\_t, constexpr, decltype, noexcept, nullptr, static\_assert, and thread\_local. Valid C++ 2003 code using these identifiers is invalid in this revision of C++.

- <sup>4</sup> **Affected subclause:** 5.13.2

**Change:** Type of integer literals.**Rationale:** C99 compatibility.

**Effect on original feature:** Certain integer literals larger than can be represented by long could change from an unsigned integer type to signed long long.

**C.6.3 Clause 7: expressions**

[diff.cpp03.expr]

- <sup>1</sup> **Affected subclause:** 7.3.12

**Change:** Only literals are integer null pointer constants.**Rationale:** Removing surprising interactions with templates and constant expressions.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
void f(void *); // #1
void f(...); // #2
template<int N> void g() {
 f(0*N); // calls #2; used to call #1
}
```

- <sup>2</sup> **Affected subclause:** 7.6.5

**Change:** Specify rounding for results of integer / and %.**Rationale:** Increase portability, C99 compatibility.

**Effect on original feature:** Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.

- <sup>3</sup> **Affected subclause:** 7.6.14

**Change:** && is valid in a *type-name*.**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```
bool b1 = new int && false; // previously false, now ill-formed
struct S { operator int(); };
bool b2 = &S::operator int && false; // previously false, now ill-formed
```

#### C.6.4 Clause 9: declarations

[diff.cpp03.dcl.dcl]

<sup>1</sup> **Affected subclause:** 9.2

**Change:** Remove auto as a storage class specifier.

**Rationale:** New feature.

**Effect on original feature:** Valid C++ 2003 code that uses the keyword auto as a storage class specifier may be invalid in this revision of C++. In this revision of C++, auto indicates that the type of a variable is to be deduced from its initializer expression.

<sup>2</sup> **Affected subclause:** 9.4.5

**Change:** Narrowing restrictions in aggregate initializers.

**Rationale:** Catches bugs.

**Effect on original feature:** Valid C++ 2003 code may fail to compile in this revision of C++. For example:

```
int x[] = { 2.0 };
```

This code is valid in C++ 2003 but invalid in this revision of C++ because double to int is a narrowing conversion.

#### C.6.5 Clause 11: classes

[diff.cpp03.class]

<sup>1</sup> **Affected subclauses:** 11.4.5.2, 11.4.7, 11.4.5.3, and 11.4.6

**Change:** Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.

**Rationale:** Improves template argument deduction failure.

**Effect on original feature:** A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

<sup>2</sup> **Affected subclause:** 11.4.7

**Change:** User-declared destructors have an implicit exception specification.

**Rationale:** Clarification of destructor requirements.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call std::terminate (without calling std::unexpected) if their exception specification is non-throwing.

#### C.6.6 Clause 13: templates

[diff.cpp03.temp]

<sup>1</sup> **Affected subclause:** 13.2

**Change:** Repurpose export for modules (Clause 10, 15.4, 15.5).

**Rationale:** No implementation consensus for the C++ 2003 meaning of export.

**Effect on original feature:** A valid C++ 2003 program containing export is ill-formed in this revision of C++.

<sup>2</sup> **Affected subclause:** 13.4

**Change:** Remove whitespace requirement for nested closing template right angle brackets.

**Rationale:** Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.

**Effect on original feature:** Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“>”) followed immediately by another right angle bracket may now be treated as closing two templates. For example:

```
template <class T> struct X { };
template <int N> struct Y { };
X< Y< 1 >> 2 > > x;
```

This code is valid in C++ 2003 because “>>” is a right-shift operator, but invalid in this revision of C++ because “>>” closes two templates.

<sup>3</sup> **Affected subclause:** 13.8.4.2

**Change:** Allow dependent calls of functions with internal linkage.

**Rationale:** Overly constrained, simplify overload resolution rules.

**Effect on original feature:** A valid C++ 2003 program can get a different result in this revision of C++.

### C.6.7 Clause 16: library introduction

[diff.cpp03.library]

- <sup>1</sup> **Affected:** Clause 16 – Clause 33

**Change:** New reserved identifiers.

**Rationale:** Required by new features.

**Effect on original feature:** Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.

- <sup>2</sup> **Affected subclause:** 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: <array> (24.3.2), <atomic> (33.5.2), <chrono> (29.2), <codecvt> (D.26.2), <condition\_variable> (33.7.2), <forward\_list> (24.3.4), <future> (33.10.2), <initializer\_list> (17.10.2), <mutex> (33.6.2), <random> (28.5.2), <ratio> (21.4.2), <regex> (32.3), <scoped\_allocator> (20.5.1), <system\_error> (19.5.2), <thread> (33.4.2), <tuple> (22.4.2), <type-index> (22.11.1), <type\_traits> (21.3.3), <unordered\_map> (24.5.2), and <unordered\_set> (24.5.3). In addition the following C compatibility headers are new: <cfenv> (28.3.1), <cinttypes> (31.13.2), <cstdint> (17.4.1), and <cuchar> (23.5.5). Valid C++ 2003 code that #includes headers with these names may be invalid in this revision of C++.

- <sup>3</sup> **Affected subclause:** 16.4.4.3

**Effect on original feature:** Function swap moved to a different header

**Rationale:** Remove dependency on <algorithm> (27.4) for swap.

**Effect on original feature:** Valid C++ 2003 code that has been compiled expecting swap to be in <algorithm> (27.4) may have to instead include <utility> (22.2.1).

- <sup>4</sup> **Affected subclause:** 16.4.5.2.2

**Change:** New reserved namespace.

**Rationale:** New functionality.

**Effect on original feature:** The global namespace posix is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace posix may be invalid in this revision of C++.

- <sup>5</sup> **Affected subclause:** 16.4.6.3

**Change:** Additional restrictions on macro names.

**Rationale:** Avoid hard to diagnose or non-portable constructs.

**Effect on original feature:** Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines override, final, carries\_dependency, or noreturn as macros is invalid in this revision of C++.

### C.6.8 Clause 17: language support library

[diff.cpp03.language.support]

- <sup>1</sup> **Affected subclause:** 17.6.3.2

**Change:** operator new may throw exceptions other than std::bad\_alloc.

**Rationale:** Consistent application of noexcept.

**Effect on original feature:** Valid C++ 2003 code that assumes that global operator new only throws std::bad\_alloc may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable operator new is ill-formed in this revision of C++, because the exception specification of throw(std::bad\_alloc) was removed.

### C.6.9 Clause 19: diagnostics library

[diff.cpp03.diagnostics]

- <sup>1</sup> **Affected subclause:** 19.4

**Change:** Thread-local error numbers.

**Rationale:** Support for new thread facilities.

**Effect on original feature:** Valid but implementation-specific C++ 2003 code that relies on errno being the same across threads may change behavior in this revision of C++.

**C.6.10 Clause 22: general utilities library**

[diff.cpp03.utilities]

- <sup>1</sup> **Affected subclauses:** [22.10.6](#), [22.10.7](#), [22.10.8](#), [22.10.10](#), and [22.10.11](#)

**Change:** Standard function object types no longer derived from `std::unary_function` or `std::binary_function`.

**Rationale:** Superseded by new feature; `unary_function` and `binary_function` are no longer defined.

**Effect on original feature:** Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this revision of C++.

**C.6.11 Clause 23: strings library**

[diff.cpp03.strings]

- <sup>1</sup> **Affected subclause:** [23.4](#)

**Change:** `basic_string` requirements no longer allow reference-counted strings.

**Rationale:** Invalidation is subtly different with reference-counted strings. This change regularizes behavior.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++.

- <sup>2</sup> **Affected subclause:** [23.4.3.2](#)

**Change:** Loosens `basic_string` invalidation rules.

**Rationale:** Allow small-string optimization.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. Some `const` member functions, such as `data` and `c_str`, no longer invalidate iterators.

**C.6.12 Clause 24: containers library**

[diff.cpp03.containers]

- <sup>1</sup> **Affected subclause:** [24.2](#)

**Change:** Complexity of `size()` member functions now constant.

**Rationale:** Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.

**Effect on original feature:** Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this revision of C++. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.

- <sup>2</sup> **Affected subclause:** [24.2](#)

**Change:** Requirements change: relaxation.

**Rationale:** Clarification.

**Effect on original feature:** Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

- (2.1) — not all containers provide `size()`; use `empty()` instead of `size() == 0`;
- (2.2) — not all containers are empty after construction (`array`);
- (2.3) — not all containers have constant complexity for `swap()` (`array`).

- <sup>3</sup> **Affected subclause:** [24.2](#)

**Change:** Requirements change: default constructible.

**Rationale:** Clarification of container requirements.

**Effect on original feature:** Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

- <sup>4</sup> **Affected subclauses:** [24.2.4](#) and [24.2.7](#)

**Change:** Signature changes: from `void` return types.

**Rationale:** Old signature threw away useful information that may be expensive to recalculate.

**Effect on original feature:** The following member functions have changed:

- (4.1) — `erase(iterator)` for `set`, `multiset`, `map`, `multimap`
- (4.2) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (4.3) — `insert(pos, num, val)` for `vector`, `deque`, `list`, `forward_list`
- (4.4) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.

- <sup>5</sup> **Affected subclauses:** [24.2.4](#) and [24.2.7](#)

**Change:** Signature changes: from `iterator` to `const_iterator` parameters.

**Rationale:** Overspecification.

**Effect on original feature:** The signatures of the following member functions changed from taking an `iterator` to taking a `const_iterator`:

- (5.1) — `insert(iterator, val)` for `vector`, `deque`, `list`, `set`, `multiset`, `map`, `multimap`
- (5.2) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`
- (5.3) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (5.4) — all forms of `list::splice`
- (5.5) — all forms of `list::merge`

Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

<sup>6</sup> **Affected subclauses:** [24.2.4](#) and [24.2.7](#)

**Change:** Signature changes: `resize`.

**Rationale:** Performance, compatibility with move semantics.

**Effect on original feature:** For `vector`, `deque`, and `list` the fill value passed to `resize` is now passed by reference instead of by value, and an additional overload of `resize` has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.

### C.6.13 Clause 27: algorithms library

[[diff.cpp03.algorithms](#)]

<sup>1</sup> **Affected subclause:** [27.1](#)

**Change:** Result state of inputs after application of some algorithms.

**Rationale:** Required by new feature.

**Effect on original feature:** A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, `std::remove` and `std::remove_if` may leave the tail of the input sequence with a different set of values than previously.

### C.6.14 Clause 28: numerics library

[[diff.cpp03.numerics](#)]

<sup>1</sup> **Affected subclause:** [28.4](#)

**Change:** Specified representation of complex numbers.

**Rationale:** Compatibility with C99.

**Effect on original feature:** Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of `std::complex` may not be compatible with this revision of C++.

### C.6.15 Clause 30: localization library

[[diff.cpp03.locale](#)]

<sup>1</sup> **Affected subclause:** [30.4.3.2.3](#)

**Change:** The `num_get` facet recognizes hexadecimal floating point values.

**Rationale:** Required by new feature.

**Effect on original feature:** Valid C++ 2003 code may have different behavior in this revision of C++.

### C.6.16 Clause 31: input/output library

[[diff.cpp03.input.output](#)]

<sup>1</sup> **Affected subclauses:** [31.7.5.2.4](#), [31.7.6.2.4](#), and [31.5.4.4](#)

**Change:** Specify use of `explicit` in existing boolean conversion functions.

**Rationale:** Clarify intentions, avoid workarounds.

**Effect on original feature:** Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

- (1.1) — passing a value to a function that takes an argument of type `bool`;
- (1.2) — using `operator==` to compare to `false` or `true`;
- (1.3) — returning a value from a function with a return type of `bool`;
- (1.4) — initializing members of type `bool` via aggregate initialization;
- (1.5) — initializing a `const bool&` which would bind to a temporary object.

<sup>2</sup> **Affected subclause:** [31.5.2.2.1](#)

**Change:** Change base class of `std::ios_base::failure`.

**Rationale:** More detailed error messages.

**Effect on original feature:** `std::ios_base::failure` is no longer derived directly from `std::exception`,

but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this revision of C++.

<sup>3</sup> **Affected subclause:** 31.5.2

**Change:** Flag types in `std::ios_base` are now bitmasks with values defined as `constexpr` static members.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code that relies on `std::ios_base` flag types being represented as `std::bitset` or as an integer type may fail to compile with this revision of C++. For example:

```
#include <iostream>

int main() {
 int flag = std::ios_base::hex;
 std::cout.setf(flag); // error: setf does not take argument of type int
}
```

## C.7 C++ and ISO C

[diff.iso]

### C.7.1 General

[diff.iso.general]

- <sup>1</sup> Subclause C.7 lists the differences between C++ and ISO C, in addition to those listed above, by the chapters of this document.

### C.7.2 Clause 5: lexical conventions

[diff.lex]

<sup>1</sup> **Affected subclause:** 5.11

**Change:** New Keywords

New keywords are added to C++; see 5.11.

**Rationale:** These keywords were added in order to implement the new semantics of C++.

**Effect on original feature:** Change to semantics of well-defined feature. Any ISO C programs that used any of these keywords as identifiers are not valid C++ programs.

**Difficulty of converting:** Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.

**How widely used:** Common.

<sup>2</sup> **Affected subclause:** 5.13.3

**Change:** Type of *character-literal* is changed from `int` to `char`.

**Rationale:** This is needed for improved overloaded function argument type matching. For example:

```
int function(int i);
int function(char c);

function('x');
```

It is preferable that this call match the second version of function rather than the first.

**Effect on original feature:** Change to semantics of well-defined feature. ISO C programs which depend on

```
sizeof('x') == sizeof(int)
```

will not work the same as C++ programs.

**Difficulty of converting:** Simple.

**How widely used:** Programs which depend upon `sizeof('x')` are probably rare.

<sup>3</sup> **Affected subclause:** 5.13.5

**Change:** Concatenated *string-literals* can no longer have conflicting *encoding-prefixes*.

**Rationale:** Removal of non-portable feature.

**Effect on original feature:** Concatenation of *string-literals* with different *encoding-prefixes* is now ill-formed.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>4</sup> **Affected subclause:** 5.13.5

**Change:** String literals made `const`.

The type of a *string-literal* is changed from “array of `char`” to “array of `const char`”. The type of a UTF-8 string literal is changed from “array of `char`” to “array of `const char8_t`”. The type of a UTF-16 string literal is changed from “array of *some-integer-type*” to “array of `const char16_t`”. The type of a UTF-32 string literal is changed from “array of *some-integer-type*” to “array of `const char32_t`”. The type of a wide string literal is changed from “array of `wchar_t`” to “array of `const wchar_t`”.

**Rationale:** This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Syntactic transformation. The fix is to add a cast:

```
char* p = "abc"; // valid in C, invalid in C++
void f(char*) {
 char* p = (char*)"abc"; // OK, cast added
 f(p);
 f((char*)"def"); // OK, cast added
}
```

**How widely used:** Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.

### C.7.3 Clause 6: basics

[diff.basic]

<sup>1</sup> **Affected subclause:** 6.2

**Change:** C++ does not have “tentative definitions” as in C.

E.g., at file scope,

```
int i;
int i;
```

is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C. For example,

```
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

**Rationale:** This avoids having different initialization rules for fundamental types and user-defined types.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.

**How widely used:** Seldom.

<sup>2</sup> **Affected subclause:** 6.4

**Change:** A **struct** is a scope in C++, not in C. For example,

```
struct X {
 struct Y { int a; } b;
};

struct Y c;
```

is valid in C but not in C++, which would require `X::Y c;`.

**Rationale:** Class scope is crucial to C++, and a **struct** is a class.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** C programs use **struct** extremely frequently, but the change is only noticeable when **struct**, enumeration, or enumerator names are referred to outside the **struct**. The latter is probably rare.

<sup>3</sup> **Affected subclause:** 6.6 [also 9.2.9]

**Change:** A name of file scope that is explicitly declared **const**, and not explicitly declared **extern**, has internal linkage, while in C it would have external linkage.

**Rationale:** Because **const** objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each **const** object. This feature allows the user to put **const** objects in source files that are included in more than one translation unit.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

<sup>4</sup> **Affected subclause:** 6.9.3.1

**Change:** The **main** function cannot be called recursively and cannot have its address taken.

**Rationale:** The **main** function may require special actions.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Trivial: create an intermediary function such as `mymain(argc, argv)`.  
**How widely used:** Seldom.

5 **Affected subclause:** [6.8](#)

**Change:** C allows “compatible types” in several places, C++ does not.

For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

**Rationale:** Stricter type checking is essential for C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.

**How widely used:** Common.

#### C.7.4 Clause 7: expressions

[diff.expr]

1 **Affected subclause:** [7.3.12](#)

**Change:** Converting `void*` to a pointer-to-object type requires casting.

```
char a[10];
void* b=a;
void foo() {
 char* c=b;
}
```

ISO C accepts this usage of pointer to `void` being assigned to a pointer to object type. C++ does not.

**Rationale:** C++ tries harder than C to enforce compile-time type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```
char* c = (char*) b;
```

**How widely used:** This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

2 **Affected subclauses:** [7.6.1.6](#) and [7.6.2.3](#)

**Change:** Decrement operator is not allowed with `bool` operand.

**Rationale:** Feature with surprising semantics.

**Effect on original feature:** A valid ISO C expression utilizing the decrement operator on a `bool` lvalue (for instance, via the C typedef in `<stdbool.h>` ([17.14.5](#))) is ill-formed in C++.

3 **Affected subclauses:** [7.6.2.5](#) and [7.6.3](#)

**Change:** In C++, types can only be defined in declarations, not in expressions.

In C, a `sizeof` expression or cast expression may define a new type. For example,

```
p = (void*)(struct x {int i;} *)0;
```

defines a new type, `struct x`.

**Rationale:** This prohibition helps to clarify the location of definitions in the source code.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

4 **Affected subclauses:** [7.6.16](#), [7.6.19](#), and [7.6.20](#)

**Change:** The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

**Rationale:** C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

**Effect on original feature:** Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

```
char arr[100];
sizeof(0, arr)
```

yields 100 in C++ and `sizeof(char*)` in C.

**Difficulty of converting:** Programs must add explicit casts to the appropriate rvalue.

**How widely used:** Rare.

### C.7.5 Clause 8: statements

[diff.stat]

<sup>1</sup> **Affected subclauses:** 8.5.3 and 8.7.6

**Change:** It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

**Rationale:** Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, many operations on such an uninitialized object have undefined behavior. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

<sup>2</sup> **Affected subclause:** 8.7.4

**Change:** It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

**Rationale:** The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between functions with `void` and `int` return types.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Add an appropriate return value to the source code, such as zero.

**How widely used:** Seldom. For several years, many existing C implementations have produced warnings in this case.

### C.7.6 Clause 9: declarations

[diff.dcl]

<sup>1</sup> **Affected subclause:** 9.2.2

**Change:** In C++, the `static` or `extern` specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

Example:

```
static struct S { // valid C, invalid in C++
 int i;
};
```

**Rationale:** Storage class specifiers don't have any meaning when associated with a type. In C++, class members can be declared with the `static` storage class specifier. Storage class specifiers on type declarations can be confusing for users.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>2</sup> **Affected subclause:** 9.2.2

**Change:** In C++, `register` is not a storage class specifier.

**Rationale:** The storage class specifier had no effect in C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common.

<sup>3</sup> **Affected subclause:** 9.2.4

**Change:** A C++ `typedef-name` must be different from any class type name declared in the same scope (except if the `typedef` is a synonym of the class name with the same name). In C, a `typedef-name` and a struct tag name declared in the same scope can have the same name (because they have different name spaces).

Example:

```
typedef struct name1 { /* ... */ } name1; // valid C and C++
struct name { /* ... */ };
typedef int name; // valid C, invalid C++
```

**Rationale:** For ease of use, C++ doesn't require that a type name be prefixed with the keywords `class`, `struct` or `union` when used in object declarations or type casts.

Example:

```
class name { /* ... */ };
name i; // i has type class name
```

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. One of the 2 types has to be renamed.

**How widely used:** Seldom.

<sup>4</sup> **Affected subclause:** [9.2.9](#) [see also [6.6](#)]

**Change:** Const objects must be initialized in C++ but can be left uninitialized in C.

**Rationale:** A const object cannot be assigned to so it must be initialized to hold a useful value.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

<sup>5</sup> **Affected subclause:** [9.2.9.6](#)

**Change:** The keyword `auto` cannot be used as a storage class specifier.

Example:

```
void f() {
 auto int x; // valid C, invalid C++
}
```

**Rationale:** Allowing the use of `auto` to deduce the type of a variable from its initializer results in undesired interpretations of `auto` as a storage class specifier in certain contexts.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Rare.

<sup>6</sup> **Affected subclause:** [9.3.4.6](#)

**Change:** In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

Example:

```
int f(); // means int f(void) in C++
// int f(unknown) in C
```

**Rationale:** This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).

**Effect on original feature:** Change to semantics of well-defined feature. This feature was marked as "obsolete" in C.

**Difficulty of converting:** Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.

**How widely used:** Common.

<sup>7</sup> **Affected subclause:** [9.3.4.6](#) [see [7.6.2.5](#)]

**Change:** In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

Example:

```
void f(struct S { int a; } arg) {} // valid C, invalid C++
enum E { A, B, C } f() {} // valid C, invalid C++
```

**Rationale:** When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The type definitions must be moved to file scope, or in header files.

**How widely used:** Seldom. This style of type definition is seen as poor coding style.

<sup>8</sup> **Affected subclause:** 9.5

**Change:** In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.

**Rationale:** Prototypes are essential to type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common in old programs, but already known to be obsolescent.

<sup>9</sup> **Affected subclause:** 9.4.2

**Change:** In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

Example:

```
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2}; // valid C, invalid C++
int arr[3] = {[1] = 5}; // valid C, invalid C++
struct B b = {.a.x = 0}; // valid C, invalid C++
struct A c = {.x = 1, 2}; // valid C, invalid C++
```

**Rationale:** In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so member initializers must be specified in order. Array designators conflict with *lambda-expression* syntax. Nested designators are seldom used.

**Effect on original feature:** Deletion of feature that is incompatible with C++.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Out-of-order initializers are common. The other features are seldom used.

<sup>10</sup> **Affected subclause:** 9.4.3

**Change:** In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating '\0') must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating '\0'.

Example:

```
char array[4] = "abcd"; // valid C, invalid C++
```

**Rationale:** When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The arrays must be declared one element bigger to contain the string terminating '\0'.

**How widely used:** Seldom. This style of array initialization is seen as poor coding style.

<sup>11</sup> **Affected subclause:** 9.7.1

**Change:** C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

Example:

```
enum color { red, blue, green };
enum color c = 1; // valid C, invalid C++
```

**Rationale:** The type-safe nature of C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

**How widely used:** Common.

<sup>12</sup> **Affected subclause:** 9.7.1

**Change:** In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is `int`.

Example:

```
enum e { A };
sizeof(A) == sizeof(int) // in C
sizeof(A) == sizeof(e) // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

**Rationale:** In C++, an enumeration is a distinct type.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

13 **Affected subclause:** [9.12.2](#)

**Change:** In C++, an *alignment-specifier* is an *attribute-specifier*. In C, an *alignment-specifier* is a *declaration-specifier*.

Example:

```
#include <stdalign.h>
unsigned alignas(8) int x; // valid C, invalid C++
unsigned int y alignas(8); // valid C++, invalid C
```

**Rationale:** C++ requires unambiguous placement of the *alignment-specifier*.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

### C.7.7 Clause 11: classes

[[diff.class](#)]

1 **Affected subclause:** [11.3](#) [see also [9.2.4](#)]

**Change:** In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

Example:

```
int x[99];
void f() {
 struct x { int a; };
 sizeof(x); /* size of the array in C */
 /* size of the struct in C++ */
}
```

**Rationale:** This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords `class`, `struct`, `union` or `enum` be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. If the hidden name that needs to be accessed is at global scope, the `::` C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.

**How widely used:** Seldom.

2 **Affected subclause:** [11.4.5.3](#)

**Change:** Copying volatile objects.

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue. For example, the following is valid in ISO C:

```
struct X { int i; };
volatile struct X x1 = {0};
struct X x2 = x1; // invalid C++
struct X x3;
x3 = x1; // also invalid C++
```

**Rationale:** Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two

alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit `const_cast` can be used.

**How widely used:** Seldom.

<sup>3</sup> **Affected subclause:** [11.4.10](#)

**Change:** Bit-fields of type plain `int` are signed.

**Rationale:** The signedness needs to be consistent among template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.

**Effect on original feature:** The choice is implementation-defined in C, but not so in C++.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>4</sup> **Affected subclause:** [11.4.12](#)

**Change:** In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

Example:

```
struct X {
 struct Y { /* ... */ } y;
};

struct Y yy; // valid C, invalid C++
```

**Rationale:** C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing struct is defined. Example:

```
struct Y; // struct Y and struct X are at the same scope
struct X {
 struct Y { /* ... */ } y;
};
```

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in [6.4](#).

**How widely used:** Seldom.

<sup>5</sup> **Affected subclause:** [6.5.2](#)

**Change:** In C++, a `typedef-name` may not be redeclared in a class definition after being used in that definition.

Example:

```
typedef int I;
struct S {
 I i;
 int I; // valid C, invalid C++
};
```

**Rationale:** When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of `I` really is.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Either the type or the struct member has to be renamed.

**How widely used:** Seldom.

**C.7.8 Clause 15: preprocessing directives**

[diff.cpp]

- <sup>1</sup> **Affected subclause:** [15.11](#)

**Change:** Whether `__STDC__` is defined and if so, what its value is, are implementation-defined.

**Rationale:** C++ is not identical to ISO C. Mandating that `__STDC__` be defined would require that translators make an incorrect claim.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Programs and headers that reference `__STDC__` are quite common.

**C.8 C standard library**

[diff.library]

**C.8.1 General**

[diff.library.general]

- <sup>1</sup> Subclause [C.8](#) summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

**C.8.2 Modifications to headers**

[diff.mods.to.headers]

- <sup>1</sup> For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in [17.14](#).
- <sup>2</sup> There are no C++ headers for the C standard library's headers `<stdnoreturn.h>` and `<threads.h>`, nor are these headers from the C standard library headers themselves part of C++.
- <sup>3</sup> The C headers `<complex.h>` and `<tgmath.h>` do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

**C.8.3 Modifications to definitions**

[diff.mods.todefinitions]

**C.8.3.1 Types `char16_t` and `char32_t`**

[diff.char16]

- <sup>1</sup> The types `char16_t` and `char32_t` are distinct types rather than typedefs to existing integral types. The tokens `char16_t` and `char32_t` are keywords in C++ ([5.11](#)). They do not appear as macro or type names defined in `<cuchar>` ([23.5.5](#)).

**C.8.3.2 Type `wchar_t`**

[diff.wchar.t]

- <sup>1</sup> The type `wchar_t` is a distinct type rather than a typedef to an existing integral type. The token `wchar_t` is a keyword in C++ ([5.11](#)). It does not appear as a macro or type name defined in any of `<cstddef>` ([17.2.1](#)), `<cstdlib>` ([17.2.2](#)), or `<cwchar>` ([23.5.4](#)).

**C.8.3.3 Header `<assert.h>`**

[diff.header.assert.h]

- <sup>1</sup> The token `static_assert` is a keyword in C++. It does not appear as a macro name defined in `<cassert>` ([19.3.2](#)).

**C.8.3.4 Header `<iso646.h>`**

[diff.header.iso646.h]

- <sup>1</sup> The tokens `and`, `and_eq`, `bitand`, `bitor`, `compl`, `not`, `not_eq`, `or`, `or_eq`, `xor`, and `xor_eq` are keywords in C++ ([5.11](#)), and are not introduced as macros by `<iso646.h>` ([17.14.3](#)).

**C.8.3.5 Header `<stdalign.h>`**

[diff.header.stdalign.h]

- <sup>1</sup> The token `alignas` is a keyword in C++ ([5.11](#)), and is not introduced as a macro by `<stdalign.h>` ([17.14.4](#)).

**C.8.3.6 Header `<stdbool.h>`**

[diff.headerstdbool.h]

- <sup>1</sup> The tokens `bool`, `true`, and `false` are keywords in C++ ([5.11](#)), and are not introduced as macros by `<stdbool.h>` ([17.14.5](#)).

**C.8.3.7 Macro `NULL`**

[diff.null]

- <sup>1</sup> The macro `NULL`, defined in any of `<clocale>` ([30.5.1](#)), `<cstddef>` ([17.2.1](#)), `<cstdio>` ([31.13.1](#)), `<cstdlib>` ([17.2.2](#)), `<cstring>` ([23.5.3](#)), `<ctime>` ([29.15](#)), or `<cwchar>` ([23.5.4](#)), is an implementation-defined null pointer constant in C++ ([17.2](#)).

**C.8.4 Modifications to declarations**

[diff.mods.to.declarations]

- <sup>1</sup> Header <cstring> (23.5.3): The following functions have different declarations:

- (1.1) — `strchr`
- (1.2) — `strpbrk`
- (1.3) — `strrchr`
- (1.4) — `strstr`
- (1.5) — `memchr`

Subclause 23.5.3 describes the changes.

- <sup>2</sup> Header <cwchar.h> (23.5.4): The following functions have different declarations:

- (2.1) — `wcschr`
- (2.2) — `wcspbrk`
- (2.3) — `wcsrchr`
- (2.4) — `wcsstr`
- (2.5) — `wmemchr`

Subclause 23.5.4 describes the changes.

- <sup>3</sup> Header <cstddef> (17.2.1) declares the names `nullptr_t`, `byte`, and `to_integer`, and the operators and operator templates in (17.2.5), in addition to the names declared in <stddef.h> (17.14) in the C standard library.

**C.8.5 Modifications to behavior**

[diff.mods.to.behavior]

**C.8.5.1 General**

[diff.mods.to.behavior.general]

- <sup>1</sup> Header <cstdlib> (17.2.2): The following functions have different behavior:

- (1.1) — `atexit`
- (1.2) — `exit`
- (1.3) — `abort`

Subclause 17.5 describes the changes.

- <sup>2</sup> Header <csetjmp> (17.13.3): The following functions have different behavior:

- (2.1) — `longjmp`

Subclause 17.13.3 describes the changes.

**C.8.5.2 Macro `offsetof(type, member-designator)`**

[diff.offsetof]

- <sup>1</sup> The macro `offsetof`, defined in <cstddef> (17.2.1), accepts a restricted set of `type` arguments in C++. Subclause 17.2.4 describes the change.

**C.8.5.3 Memory allocation functions**

[diff.malloc]

- <sup>1</sup> The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.2.12 describes the changes.

# Annex D (normative) Compatibility features [depr]

## D.1 General

[depr.general]

- <sup>1</sup> This Annex describes features of the C++ Standard that are specified for compatibility with existing implementations.
- <sup>2</sup> These are deprecated features, where *deprecated* is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the **deprecated** attribute (9.12.5).

## D.2 Arithmetic conversion on enumerations

[depr.arith.conv.enum]

- <sup>1</sup> The ability to apply the usual arithmetic conversions (7.4) on operands where one is of enumeration type and the other is of a different enumeration type or a floating-point type is deprecated.

[Note 1: Three-way comparisons (7.6.8) between such operands are ill-formed. — *end note*]

[Example 1:

```
enum E1 { e };
enum E2 { f };
bool b = e <= 3.7; // deprecated
int k = f - e; // deprecated
auto cmp = e <=> f; // error
```

— *end example*]

## D.3 Implicit capture of **\*this** by reference

[depr.capture.this]

- <sup>1</sup> For compatibility with prior revisions of C++, a *lambda-expression* with *capture-default* = (7.5.5.3) may implicitly capture **\*this** by reference.

[Example 1:

```
struct X {
 int x;
 void foo(int n) {
 auto f = [=]() { x = n; }; // deprecated: x means this->x, not a copy thereof
 auto g = [=, this]() { x = n; }; // recommended replacement
 }
};
```

— *end example*]

## D.4 Array comparisons

[depr.array.comp]

- <sup>1</sup> Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated.

[Note 1: Three-way comparisons (7.6.8) between such operands are ill-formed. — *end note*]

[Example 1:

```
int arr1[5];
int arr2[5];
bool same = arr1 == arr2; // deprecated, same as &arr1[0] == &arr2[0],
 // does not compare array contents
auto cmp = arr1 <=> arr2; // error
```

— *end example*]

## D.5 Deprecated volatile types

[depr.volatile.type]

- <sup>1</sup> Postfix **++** and **--** expressions (7.6.1.6) and prefix **++** and **--** expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

[Example 1:

```

volatile int velociraptor;
++velociraptor; // deprecated
— end example]

```

- <sup>2</sup> Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[Example 2:

```

int neck, tail;
volatile int brachiosaur;
brachiosaur = neck; // OK
tail = brachiosaur; // OK
tail = brachiosaur = neck; // deprecated
brachiosaur += neck; // OK
— end example]

```

- <sup>3</sup> A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[Example 3:

```

volatile struct amber jurassic(); // deprecated
void trex(volatile short left_arm, volatile short right_arm); // deprecated
void fly(volatile struct pterosaur* pteranodon); // OK
— end example]

```

- <sup>4</sup> A structured binding (9.6) of a volatile-qualified type is deprecated.

[Example 4:

```

struct linhenykos { short forelimb; };
void park(linhenykos alvarezsauroid) {
 volatile auto [what_is_this] = alvarezsauroid; // deprecated
 // ...
}
— end example]

```

## D.6 Redeclaration of static constexpr data members

[depr.static.constexpr]

- <sup>1</sup> For compatibility with prior revisions of C++, a `constexpr` static data member may be redundantly redeclared outside the class with no initializer (6.2, 11.4.9.3). This usage is deprecated.

[Example 1:

```

struct A {
 static constexpr int n = 5; // definition (declaration in C++ 2014)
};

constexpr int A::n; // redundant declaration (definition in C++ 2014)
— end example]

```

## D.7 Non-local use of TU-local entities

[depr.local]

- <sup>1</sup> A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated.

[Note 1: Such a declaration in an importable module unit is ill-formed. — end note]

[Example 1:

```

namespace {
 struct A {
 void f() {}
 };
 A h(); // deprecated: not internal linkage
 inline void g() {A().f();} // deprecated: inline and not internal linkage
}
— end example]

```

**D.8 Implicit declaration of copy functions**

[depr.impldec]

- <sup>1</sup> The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. It is possible that future versions of C++ will specify that these implicit definitions are deleted (9.5.3).

**D.9 Literal operator function declarations using an identifier**

[depr.lit]

- <sup>1</sup> A *literal-operator-id* (12.6) of the form

```
operator string-literal identifier
```

is deprecated.

**D.10 template keyword before qualified names**

[depr.template.template]

- <sup>1</sup> The use of the keyword `template` before the qualified name of a class or alias template without a template argument list is deprecated (13.3).

**D.11 has\_denorm members in numeric\_limits**

[depr.numeric.limits.has.denorm]

- <sup>1</sup> The following type is defined in addition to those specified in `<limits>` (17.3.3):

```
namespace std {
 enum float_denorm_style {
 denorm_ineterminate = -1,
 denorm_absent = 0,
 denorm_present = 1
 };
}
```

- <sup>2</sup> The following members are defined in addition to those specified in 17.3.5.1:

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

- <sup>3</sup> The values of `has_denorm` and `has_denorm_loss` of specializations of `numeric_limits` are unspecified.

- <sup>4</sup> The following members of the specialization `numeric_limits<bool>` are defined in addition to those specified in 17.3.5.3:

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

**D.12 Deprecated C macros**

[depr.c.macros]

- <sup>1</sup> The header `<stdalign.h>` has the following macro:

```
#define __alignas_is_defined 1
```

- <sup>2</sup> The header `<stdbool.h>` has the following macro:

```
#define __bool_true_false_are_defined 1
```

**D.13 Relational operators**

[depr.relops]

- <sup>1</sup> The header `<utility>` (22.2.1) has the following additions:

```
namespace std::rel_ops {
 template<class T> bool operator!=(const T&, const T&);
 template<class T> bool operator> (const T&, const T&);
 template<class T> bool operator<=(const T&, const T&);
 template<class T> bool operator>=(const T&, const T&);
}
```

- <sup>2</sup> To avoid redundant definitions of `operator!=` out of `operator==` and operators `>`, `<=`, and `>=` out of `operator<`, the library provides the following:

```
template<class T> bool operator!=(const T& x, const T& y);
```

- <sup>3</sup> *Preconditions:* `T` meets the *Cpp17EqualityComparable* requirements (Table 28).

- <sup>4</sup> *Returns:* `!(x == y)`.

```

template<class T> bool operator<(const T& x, const T& y);
5 Preconditions: T meets the Cpp17LessThanComparable requirements (Table 29).
6 Returns: y < x.

template<class T> bool operator<=(const T& x, const T& y);
7 Preconditions: T meets the Cpp17LessThanComparable requirements (Table 29).
8 Returns: !(y < x).

template<class T> bool operator>=(const T& x, const T& y);
9 Preconditions: T meets the Cpp17LessThanComparable requirements (Table 29).
10 Returns: !(x < y).

```

**D.14 char\* streams**

[depr.str.strstreams]

**D.14.1 Header <strstream> synopsis**

[depr.strstream.syn]

- <sup>1</sup> The header <strstream> defines types that associate stream buffers with character array objects and assist reading and writing such objects.

```

namespace std {
 class strstreambuf;
 class istrstream;
 class ostrstream;
 class strstream;
}

```

**D.14.2 Class strstreambuf**

[depr.strstreambuf]

**D.14.2.1 General**

[depr.strstreambuf.general]

```

namespace std {
 class strstreambuf : public basic_streambuf<char> {
public:
 strstreambuf() : strstreambuf(0) {}
 explicit strstreambuf(streamsize alsize_arg);
 strstreambuf(void* (*malloc_arg)(size_t), void (*pfree_arg)(void*));
 strstreambuf(char* gnex_arg, streamsize n, char* pbeg_arg = nullptr);
 strstreambuf(const char* gnex_arg, streamsize n);

 strstreambuf(signed char* gnex_arg, streamsize n,
 signed char* pbeg_arg = nullptr);
 strstreambuf(const signed char* gnex_arg, streamsize n);
 strstreambuf(unsigned char* gnex_arg, streamsize n,
 unsigned char* pbeg_arg = nullptr);
 strstreambuf(const unsigned char* gnex_arg, streamsize n);

 virtual ~strstreambuf();

 void freeze(bool freezefl = true);
 char* str();
 int pcount();

protected:
 int_type overflow (int_type c = EOF) override;
 int_type pbackfail(int_type c = EOF) override;
 int_type underflow() override;
 pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which = ios_base::in | ios_base::out) override;
 pos_type seekpos(pos_type sp,
 ios_base::openmode which = ios_base::in | ios_base::out) override;
 streambuf* setbuf(char* s, streamsize n) override;

private:
 using strstate = T1; // exposition only
}

```

```

 static const strstate allocated; // exposition only
 static const strstate constant; // exposition only
 static const strstate dynamic; // exposition only
 static const strstate frozen; // exposition only
 strstate strmode; // exposition only
 streamsize alsiz;
 void* (*palloc)(size_t); // exposition only
 void (*pfree)(void*); // exposition only
};

}

```

<sup>1</sup> The class **strstreambuf** associates the input sequence, and possibly the output sequence, with an object of some *character array type*, whose elements store arbitrary values. The array object has several attributes.

<sup>2</sup> [Note 1: For the sake of exposition, these are represented as elements of a bitmask type (indicated here as T1) called **strstate**. The elements are:

- (2.1) — **allocated**, set when a dynamic array object has been allocated, and hence will be freed by the destructor for the **strstreambuf** object;
- (2.2) — **constant**, set when the array object has **const** elements, so the output sequence cannot be written;
- (2.3) — **dynamic**, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;
- (2.4) — **frozen**, set when the program has requested that the array object not be altered, reallocated, or freed.

— end note]

<sup>3</sup> [Note 2: For the sake of exposition, the maintained data is presented here as:

- (3.1) — **strstate strmode**, the attributes of the array object associated with the **strstreambuf** object;
- (3.2) — **int alsiz**, the suggested minimum size for a dynamic array object;
- (3.3) — **void\* (\*palloc)(size\_t)**, points to the function to call to allocate a dynamic array object;
- (3.4) — **void (\*pfree)(void\*)**, points to the function to call to free a dynamic array object.

— end note]

<sup>4</sup> Each object of class **strstreambuf** has a *seekable area*, delimited by the pointers **seeklow** and **seekhigh**. If **gnext** is a null pointer, the seekable area is undefined. Otherwise, **seeklow** equals **gbeg** and **seekhigh** is either **pend**, if **pend** is not a null pointer, or **gend**.

#### D.14.2.2 **strstreambuf** constructors

[depr.strstreambuf.cons]

**explicit strstreambuf(streamsize alsiz\_arg);**

<sup>1</sup> Effects: Initializes the base class with **streambuf()**. The postconditions of this function are indicated in [Table D.1](#).

**Table D.1 — strstreambuf(streamsize) effects** [tab:depr.strstreambuf.cons.sz]

| Element | Value          |
|---------|----------------|
| strmode | dynamic        |
| alsiz   | alsiz_arg      |
| palloc  | a null pointer |
| pfree   | a null pointer |

**strstreambuf(void\* (\*palloc\_arg)(size\_t), void (\*pfree\_arg)(void\*));**

<sup>2</sup> Effects: Initializes the base class with **streambuf()**. The postconditions of this function are indicated in [Table D.2](#).

**strstreambuf(char\* gnex\_arg, streamsize n, char\* pbeg\_arg = nullptr);**  
**strstreambuf(signed char\* gnex\_arg, streamsize n,**  
**signed char\* pbeg\_arg = nullptr);**

**Table D.2 — `strstreambuf(void* (*)(size_t), void (*)(void*))`** effects  
 [tab:depr.strstreambuf.cons.alloc]

| Element              | Value                   |
|----------------------|-------------------------|
| <code>strmode</code> | <code>dynamic</code>    |
| <code>alsize</code>  | an unspecified value    |
| <code>palloc</code>  | <code>palloc_arg</code> |
| <code>pfree</code>   | <code>pfree_arg</code>  |

```
strstreambuf(unsigned char* gnext_arg, streamsize n,
 unsigned char* pbeg_arg = nullptr);
```

3     *Effects:* Initializes the base class with `streambuf()`. The postconditions of this function are indicated in [Table D.3](#).

**Table D.3 — `strstreambuf(charT*, streamsize, charT*)`** effects  
 [tab:depr.strstreambuf.cons.ptr]

| Element              | Value                |
|----------------------|----------------------|
| <code>strmode</code> | 0                    |
| <code>alsize</code>  | an unspecified value |
| <code>palloc</code>  | a null pointer       |
| <code>pfree</code>   | a null pointer       |

4     `gnext_arg` shall point to the first element of an array object whose number of elements  $N$  is determined as follows:

- (4.1)     — If  $n > 0$ ,  $N$  is  $n$ .
- (4.2)     — If  $n == 0$ ,  $N$  is `std::strlen(gnext_arg)`.
- (4.3)     — If  $n < 0$ ,  $N$  is `INT_MAX`.<sup>305</sup>

5     If `pbeg_arg` is a null pointer, the function executes:

```
setg(gnext_arg, gnext_arg, gnext_arg + N);
```

6     Otherwise, the function executes:

```
setg(gnext_arg, gnext_arg, pbeg_arg);
setp(pbeg_arg, pbeg_arg + N);
```

```
strstreambuf(const char* gnext_arg, streamsize n);
strstreambuf(const signed char* gnext_arg, streamsize n);
strstreambuf(const unsigned char* gnext_arg, streamsize n);
```

7     *Effects:* Behaves the same as `strstreambuf((char*)gnext_arg,n)`, except that the constructor also sets `constant` in `strmode`.

```
virtual ~strstreambuf();
```

8     *Effects:* Destroys an object of class `strstreambuf`. The function frees the dynamically allocated array object only if `(strmode & allocated) != 0` and `(strmode & frozen) == 0`. ([D.14.2.4](#) describes how a dynamically allocated array object is freed.)

#### D.14.2.3 Member functions

[[depr.strstreambuf.members](#)]

```
void freeze(bool freezefl = true);
```

1     *Effects:* If `strmode & dynamic` is nonzero, alters the freeze status of the dynamic array object as follows:

- (1.1)     — If `freezefl` is `true`, the function sets `frozen` in `strmode`.

<sup>305</sup>) The function signature `strlen(const char*)` is declared in `<cstring>` ([23.5.3](#)). The macro `INT_MAX` is defined in `<climits>` ([17.3.6](#)).

(1.2) — Otherwise, it clears `frozen` in `strmode`.

```
char* str();
```

2 *Effects:* Calls `freeze()`, then returns the beginning pointer for the input sequence, `gbeg`.

3 *Remarks:* The return value can be a null pointer.

```
int pcount() const;
```

4 *Effects:* If the next pointer for the output sequence, `pnext`, is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, `pnext - pbeg`.

#### D.14.2.4 `strstreambuf` overridden virtual functions

[depr.`strstreambuf.virtuals`]

```
int_type overflow(int_type c = EOF) override;
```

1 *Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

(1.1) — If `c != EOF` and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns `c` to `*pnext++`.

Returns `(unsigned char)c`.

(1.2) — If `c == EOF`, there is no character to append.

Returns a value other than `EOF`.

2 Returns `EOF` to indicate failure.

3 *Remarks:* The function can alter the number of write positions available as a result of any call.

4 To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements `n` to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified. If `palloc` is not a null pointer, the function calls `(*palloc)(n)` to allocate the new dynamic array object. Otherwise, it evaluates the expression `new charT[n]`. In either case, if the allocation fails, the function returns `EOF`. Otherwise, it sets `allocated` in `strmode`.

5 To free a previously existing dynamic array object whose first element address is `p`: If `pfree` is not a null pointer, the function calls `(*pfree)(p)`. Otherwise, it evaluates the expression `delete[]p`.

6 If `(strmode & dynamic) == 0`, or if `(strmode & frozen) != 0`, the function cannot extend the array (reallocate it with greater length) to make a write position available.

7 *Recommended practice:* An implementation should consider `alsize` in making the decision how many additional write positions to make available.

```
int_type pbackfail(int_type c = EOF) override;
```

8 Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(8.1) — If `c != EOF`, if the input sequence has a putback position available, and if `(char)c == gnext[-1]`, assigns `gnext - 1` to `gnext`.

Returns `c`.

(8.2) — If `c != EOF`, if the input sequence has a putback position available, and if `strmode & constant` is zero, assigns `c` to `--gnext`.

Returns `c`.

(8.3) — If `c == EOF` and if the input sequence has a putback position available, assigns `gnext - 1` to `gnext`.

Returns a value other than `EOF`.

9 Returns `EOF` to indicate failure.

10 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```
int_type underflow() override;
```

11     *Effects:* Reads a character from the *input sequence*, if possible, without moving the stream position past it, as follows:

(11.1)     — If the input sequence has a read position available, the function signals success by returning `(unsigned char)*gnext`.

(11.2)     — Otherwise, if the current write next pointer `pnext` is not a null pointer and is greater than the current read end pointer `gend`, makes a *read position* available by assigning to `gend` a value greater than `gnext` and no greater than `pnext`.

      Returns `(unsigned char)*gnext`.

12     Returns EOF to indicate failure.

13     *Remarks:* The function can alter the number of read positions available as a result of any call.

```
pos_type seekoff(off_type off, seekdir way, openmode which = in | out) override;
```

14     *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in [Table D.4](#).

**Table D.4 — `seekoff` positioning [tab:depr.strstreambuf.seekoff.pos]**

| Conditions                                                                                                                                         | Result                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <code>(which &amp; ios::in) != 0</code>                                                                                                            | positions the input sequence                      |
| <code>(which &amp; ios::out) != 0</code>                                                                                                           | positions the output sequence                     |
| <code>(which &amp; (ios::in   ios::out)) == (ios::in   ios::out)</code> and either<br><code>way == ios::beg</code> or <code>way == ios::end</code> | positions both the input and the output sequences |
| Otherwise                                                                                                                                          | the positioning operation fails.                  |

15     For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` as indicated in [Table D.5](#).

**Table D.5 — `newoff` values [tab:depr.strstreambuf.seekoff.newoff]**

| Condition                    | <code>newoff</code> Value                                                           |
|------------------------------|-------------------------------------------------------------------------------------|
| <code>way == ios::beg</code> | 0                                                                                   |
| <code>way == ios::cur</code> | the next pointer minus the beginning pointer ( <code>xnext - xbeg</code> ).         |
| <code>way == ios::end</code> | <code>seekhigh</code> minus the beginning pointer ( <code>seekhigh - xbeg</code> ). |

16     If  $(\text{newoff} + \text{off}) < (\text{seeklow} - \text{xbeg})$  or  $(\text{seekhigh} - \text{xbeg}) < (\text{newoff} + \text{off})$ , the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.

17     *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

18     *Effects:* Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in `sp` (as described below).

(18.1)     — If `(which & ios::in) != 0`, positions the input sequence.

(18.2)     — If `(which & ios::out) != 0`, positions the output sequence.

(18.3)     — If the function positions neither sequence, the positioning operation fails.

- 19 For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` from `sp.offset()`:
- (19.1) — If `newoff` is an invalid stream position, has a negative value, or has a value greater than (`seekhigh - seeklow`), the positioning operation fails
- (19.2) — Otherwise, the function adds `newoff` to the beginning pointer `xbeg` and stores the result in the next pointer `xnext`.
- 20 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
streambuf<char>* setbuf(char* s, streamsize n) override;
```

- 21 *Effects:* Behavior is implementation-defined, except that `setbuf(0, 0)` has no effect.

### D.14.3 Class `istrstream`

[depr.istrstream]

#### D.14.3.1 General

[depr.istrstream.general]

```
namespace std {
 class istrstream : public basic_istream<char> {
public:
 explicit istrstream(const char* s);
 explicit istrstream(char* s);
 istrstream(const char* s, streamsize n);
 istrstream(char* s, streamsize n);
 virtual ~istrstream();

 strstreambuf* rdbuf() const;
 char* str();
private:
 strstreambuf sb; // exposition only
};
}
```

- 1 The class `istrstream` supports the reading of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

- (1.1) — `sb`, the `strstreambuf` object.

#### D.14.3.2 `istrstream` constructors

[depr.istrstream.cons]

```
explicit istrstream(const char* s);
explicit istrstream(char* s);
```

- 1 *Effects:* Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, 0)`. `s` shall designate the first element of an NTBS.

```
istrstream(const char* s, streamsize n);
istrstream(char* s, streamsize n);
```

- 2 *Effects:* Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, n)`. `s` shall designate the first element of an array whose length is `n` elements, and `n` shall be greater than zero.

#### D.14.3.3 Member functions

[depr.istrstream.members]

```
strstreambuf* rdbuf() const;
1 Returns: const_cast<strstreambuf*>(&sb).
char* str();
2 Returns: rdbuf()->str().
```

### D.14.4 Class `ostrstream`

[depr.ostrstream]

#### D.14.4.1 General

[depr.ostrstream.general]

```

namespace std {
 class ostrstream : public basic_ostream<char> {
 public:
 ostrstream();
 ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
 virtual ~ostrstream();

 strstreambuf* rdbuf() const;
 void freeze(bool freezefl = true);
 char* str();
 int pcount() const;
 private:
 strstreambuf sb; // exposition only
 };
}

```

<sup>1</sup> The class `ostrstream` supports the writing of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `strstreambuf` object.

#### D.14.4.2 `ostrstream` constructors

[depr.ostrstream.cons]

`ostrstream();`

1 *Effects*: Initializes the base class with `ostream(&sb)` and `sb` with `strstreambuf()`.

`ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);`

2 *Effects*: Initializes the base class with `ostream(&sb)`, and `sb` with one of two constructors:

(2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements.

The constructor is `strstreambuf(s, n, s)`.

(2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an NTBS whose first element is designated by `s`. The constructor is `strstreambuf(s, n, s + std::strlen(s))`.<sup>306</sup>

#### D.14.4.3 Member functions

[depr.ostrstream.members]

`strstreambuf* rdbuf() const;`

1 *Returns*: `(strstreambuf*)&sb`.

`void freeze(bool freezefl = true);`

2 *Effects*: Calls `rdbuf()->freeze(freezefl)`.

`char* str();`

3 *Returns*: `rdbuf()->str()`.

`int pcount() const;`

4 *Returns*: `rdbuf()->pcount()`.

#### D.14.5 Class `strstream`

[depr.strstream]

##### D.14.5.1 General

[depr.strstream.general]

```

namespace std {
 class strstream
 : public basic_iostream<char> {
 public:
 // types
 using char_type = char;
 using int_type = char_traits<char>::int_type;
 using pos_type = char_traits<char>::pos_type;
 using off_type = char_traits<char>::off_type;

```

<sup>306</sup> The function signature `strlen(const char*)` is declared in `<cstring>` (23.5.3).

```

// constructors/destructor
strstream();
strstream(char* s, int n,
 ios_base::openmode mode = ios_base::in|ios_base::out);
virtual ~strstream();

// members
strstreambuf* rdbuf() const;
void freeze(bool freezefl = true);
int pcount() const;
char* str();

private:
 strstreambuf sb; // exposition only
};

}

```

- <sup>1</sup> The class **strstream** supports reading and writing from objects of class **strstreambuf**. It supplies a **strstreambuf** object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

- (1.1) — **sb**, the **strstreambuf** object.

#### D.14.5.2 **strstream** constructors

[depr.strstream.cons]

**strstream();**

- <sup>1</sup> *Effects*: Initializes the base class with **iostream(&sb)**.

**strstream(char\* s, int n,**  
     *ios\_base::openmode mode = ios\_base::in|ios\_base::out*);

- <sup>2</sup> *Effects*: Initializes the base class with **iostream(&sb)**, and **sb** with one of the two constructors:

- (2.1) — If **(mode & app) == 0**, then **s** shall designate the first element of an array of **n** elements. The constructor is **strstreambuf(s,n,s)**.
- (2.2) — If **(mode & app) != 0**, then **s** shall designate the first element of an array of **n** elements that contains an NTBS whose first element is designated by **s**. The constructor is **strstreambuf(s,n,s + std::strlen(s))**.

#### D.14.5.3 **strstream** destructor

[depr.strstream.dest]

**virtual ~strstream();**

- <sup>1</sup> *Effects*: Destroys an object of class **strstream**.

#### D.14.5.4 **strstream** operations

[depr.strstream.oper]

**strstreambuf\* rdbuf() const;**

- <sup>1</sup> *Returns*: **const\_cast<strstreambuf\*>(&sb)**.

**void freeze(bool freezefl = true);**

- <sup>2</sup> *Effects*: Calls **rdbuf()->freeze(freezefl)**.

**char\* str();**

- <sup>3</sup> *Returns*: **rdbuf()->str()**.

**int pcount() const;**

- <sup>4</sup> *Returns*: **rdbuf()->pcount()**.

### D.15 Deprecated error numbers

[depr.cerrno]

- <sup>1</sup> The following macros are defined in addition to those specified in [19.4.2](#):

```

#define ENODATA see below
#define ENOSR see below
#define ENOSTR see below
#define ETIME see below

```

- <sup>2</sup> The meaning of these macros is defined by the POSIX standard.
- <sup>3</sup> The following `enum errc` enumerators are defined in addition to those specified in 19.5.2:

```
no_message_available, // ENODATA
no_stream_resources, // ENOSR
not_a_stream, // ENOSTR
stream_timeout, // ETIME
```

- <sup>4</sup> The value of each `enum errc` enumerator above is the same as the value of the `<cerrno>` macro shown in the above synopsis.

## D.16 The default allocator

[depr.default\_allocator]

- <sup>1</sup> The following member is defined in addition to those specified in 20.2.10:

```
namespace std {
 template<class T> class allocator {
 public:
 using is_always_equal = true_type;
 };
}
```

## D.17 Deprecated polymorphic\_allocator member function [depr.mem.poly\_allocator.mem]

- <sup>1</sup> The following member is declared in addition to those members specified in 20.4.3.3:

```
namespace std::pmr {
 template<classTp = byte>
 class polymorphic_allocator {
 public:
 template <class T>
 void destroy(T* p);
 };

 template<class T>
 void destroy(T* p);
}
```

- <sup>2</sup> *Effects:* As if by `p->~T()`.

## D.18 Deprecated type traits

[depr.meta.types]

- <sup>1</sup> The header `<type_traits>` (21.3.3) has the following addition:

```
namespace std {
 template<class T> struct is_pod;
 template<class T> constexpr bool is_pod_v = is_pod<T>::value;
 template<size_t Len, size_t Align = default_alignment> // see below
 struct aligned_storage;
 template<size_t Len, size_t Align = default_alignment> // see below
 using aligned_storage_t = typename aligned_storage<Len, Align>::type;
 template<size_t Len, class... Types>
 struct aligned_union;
 template<size_t Len, class... Types>
 using aligned_union_t = typename aligned_union<Len, Types...>::type;
}
```

- <sup>2</sup> The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.
- <sup>3</sup> A *POD class* is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A *POD type* is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

```
template<class T> struct is_pod;
```

- <sup>4</sup> *Preconditions:* `remove_all_extents_t<T>` shall be a complete type or *cv void*.

- <sup>5</sup> *Remarks:* `is_pod<T>` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise.

6 [Note 1: It is unspecified whether a closure type (7.5.5.2) is a POD type. —end note]

```
template<size_t Len, size_t Align = default-alignment>
struct aligned_storage;
```

7 The value of *default-alignment* is the most stringent alignment requirement for any object type whose size is no greater than *Len* (6.8).

8 *Mandates*: *Len* is not zero. *Align* is equal to `alignof(T)` for some type *T* or to *default-alignment*.

9 The member typedef *type* denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most *Len* and whose alignment is a divisor of *Align*.

10 [Note 2: Uses of `aligned_storage<Len, Align>::type` can be replaced by an array `std::byte[Len]` declared with `alignas(Align)`. —end note]

11 [Note 3: A typical implementation would define `aligned_storage` as:

```
template<size_t Len, size_t Alignment>
struct aligned_storage {
 typedef struct {
 alignas(Alignment) unsigned char __data[Len];
 } type;
};
```

—end note]

```
template<size_t Len, class... Types>
struct aligned_union;
```

12 *Mandates*: At least one type is provided. Each type in the template parameter pack *Types* is a complete object type.

13 The member typedef *type* denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in *Types*; its size shall be at least *Len*. The static member *alignment\_value* is an integral constant of type `size_t` whose value is the strictest alignment of all types listed in *Types*.

## D.19 Tuple

[depr.tuple]

1 The header `<tuple>` (22.4.2) has the following additions:

```
namespace std {
 template<class T> struct tuple_size<volatile T>;
 template<class T> struct tuple_size<const volatile T>;

 template<size_t I, class T> struct tuple_element<I, volatile T>;
 template<size_t I, class T> struct tuple_element<I, const volatile T>;
}

template<class T> struct tuple_size<volatile T>;
template<class T> struct tuple_size<const volatile T>;
```

2 Let *TS* denote `tuple_size<T>` of the cv-unqualified type *T*. If the expression *TS::value* is well-formed when treated as an unevaluated operand (7.2.3), then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a base characteristic of `integral_constant<size_t, TS::value>`. Otherwise, they have no member *value*.

3 Access checking is performed as if in a context unrelated to *TS* and *T*. Only the validity of the immediate context of the expression is considered.

4 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, volatile T>;
template<size_t I, class T> struct tuple_element<I, const volatile T>;
```

5 Let *TE* denote `tuple_element_t<I, T>` of the cv-unqualified type *T*. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member typedef *type* that names the following type:

- (5.1) — for the first specialization, `add_volatile_t<TE>`, and  
 (5.2) — for the second specialization, `add_cv_t<TE>`.

6 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

## D.20 Variant

[depr.variant]

- 1 The header `<variant>` (22.6.2) has the following additions:

```
namespace std {
 template<class T> struct variant_size<volatile T>;
 template<class T> struct variant_size<const volatile T>;
 template<size_t I, class T> struct variant_alternative<I, volatile T>;
 template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}

template<class T> struct variant_size<volatile T>;
template<class T> struct variant_size<const volatile T>;
```

- 2 Let VS denote `variant_size<T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the *Cpp17UnaryTypeTrait* requirements with a base characteristic of `integral_constant<size_t, VS::value>`.

```
template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;
```

- 3 Let VA denote `variant_alternative<I, T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member `typedef type` that names the following type:

- (3.1) — for the first specialization, `add_volatile_t<VA::type>`, and  
 (3.2) — for the second specialization, `add_cv_t<VA::type>`.

## D.21 Deprecated iterator class template

[depr.iterator]

- 1 The header `<iterator>` (25.2) has the following addition:

```
namespace std {
 template<class Category, class T, class Distance = ptrdiff_t,
 class Pointer = T*, class Reference = T&>
 struct iterator {
 using iterator_category = Category;
 using value_type = T;
 using difference_type = Distance;
 using pointer = Pointer;
 using reference = Reference;
 };
}
```

- 2 The `iterator` template may be used as a base class to ease the definition of required types for new iterators.

3 [Note 1: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — end note]

4 [Example 1: If a C++ program wants to define a bidirectional iterator for some data structure containing `double` and such that it works on a large memory model of the implementation, it can do so with:

```
class MyIterator :
 public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
 // code implementing ++, etc.
};

— end example]
```

## D.22 Deprecated move\_iterator access

[depr.move.iter.elem]

- 1 The following member is declared in addition to those members specified in 25.5.4.6:

```
namespace std {
 template<class Iterator>
 class move_iterator {
 public:
 constexpr pointer operator->() const;
 };
}
```

**2**     constexpr pointer operator->() const;

*Returns:* current.

### D.23 Deprecated shared\_ptr atomic access

[depr.util.smartptr.shared.atomic]

- 1** The header <memory> (20.2.2) has the following additions:

```
namespace std {
 template<class T>
 bool atomic_is_lock_free(const shared_ptr<T>* p);

 template<class T>
 shared_ptr<T> atomic_load(const shared_ptr<T>* p);
 template<class T>
 shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

 template<class T>
 void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
 template<class T>
 void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

 template<class T>
 shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
 template<class T>
 shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

 template<class T>
 bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
 template<class T>
 bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
 template<class T>
 bool atomic_compare_exchange_weak_explicit(
 shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
 memory_order success, memory_order failure);
 template<class T>
 bool atomic_compare_exchange_strong_explicit(
 shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
 memory_order success, memory_order failure);
}
```

- 2** Concurrent access to a `shared_ptr` object from multiple threads does not introduce a data race if the access is done exclusively via the functions in this subclause and the instance is passed as their first argument.

- 3** The meaning of the arguments of type `memory_order` is explained in 33.5.4.

**4** `template<class T> bool atomic_is_lock_free(const shared_ptr<T>* p);`

*Preconditions:* `p` is not null.

**5** *Returns:* `true` if atomic access to `*p` is lock-free, `false` otherwise.

**6** *Throws:* Nothing.

**7** `template<class T> shared_ptr<T> atomic_load(const shared_ptr<T>* p);`

*Preconditions:* `p` is not null.

**8** *Returns:* `atomic_load_explicit(p, memory_order::seq_cst)`.

**9** *Throws:* Nothing.

```

template<class T> shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);
10 Preconditions: p is not null. mo is neither memory_order::release nor memory_order::acq_rel.
11 Returns: *p.
12 Throws: Nothing.

template<class T> void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
13 Preconditions: p is not null.
14 Effects: As if by atomic_store_explicit(p, r, memory_order::seq_cst).
15 Throws: Nothing.

template<class T> void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
16 Preconditions: p is not null. mo is neither memory_order::acquire nor memory_order::acq_rel.
17 Effects: As if by p->swap(r).
18 Throws: Nothing.

template<class T> shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
19 Preconditions: p is not null.
20 Returns: atomic_exchange_explicit(p, r, memory_order::seq_cst).
21 Throws: Nothing.

template<class T>
shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
22 Preconditions: p is not null.
23 Effects: As if by p->swap(r).
24 Returns: The previous value of *p.
25 Throws: Nothing.

template<class T>
bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
26 Preconditions: p is not null and v is not null.
27 Returns:
 atomic_compare_exchange_weak_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)
28 Throws: Nothing.

template<class T>
bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
29 Returns:
 atomic_compare_exchange_strong_explicit(p, v, w, memory_order::seq_cst,
 memory_order::seq_cst)

template<class T>
bool atomic_compare_exchange_weak_explicit(
 shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
 memory_order success, memory_order failure);
template<class T>
bool atomic_compare_exchange_strong_explicit(
 shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
 memory_order success, memory_order failure);

30 Preconditions: p is not null and v is not null. The failure argument is neither memory_order::release
 nor memory_order::acq_rel.
31 Effects: If *p is equivalent to *v, assigns w to *p and has synchronization semantics corresponding to
 the value of success, otherwise assigns *p to *v and has synchronization semantics corresponding to
 the value of failure.

```

32       >Returns: true if \*p was equivalent to \*v, false otherwise.  
 33       >Throws: Nothing.  
 34       >Remarks: Two `shared_ptr` objects are equivalent if they store the same pointer value and share ownership. The weak form may fail spuriously. See 33.5.8.2.

**D.24 Deprecated `basic_string` capacity**

[depr.string.capacity]

- <sup>1</sup> The following member is declared in addition to those members specified in 23.4.3.5:

```
namespace std {
 template<class charT, class traits = char_traits<charT>,
 class Allocator = allocator<charT>>
 class basic_string {
 public:
 void reserve();
 };
}
```

void reserve();  
 2       >Effects: After this call, `capacity()` has an unspecified value greater than or equal to `size()`.  
 [Note 1: This is a non-binding shrink to fit request. — end note]

**D.25 Deprecated formatting**

[depr.format]

**D.25.1 Header <format> synopsis**

[depr.format.syn]

- <sup>1</sup> The header <format> (22.14.1)format.syn has the following additions:

```
namespace std {
 template<class Visitor, class Context>
 decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
}
```

**D.25.2 Formatting arguments**

[depr.format.arg]

```
template<class Visitor, class Context>
 decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
```

- <sup>1</sup> Effects: Equivalent to: `return visit(std::forward<Visitor>(vis), arg.value);`

**D.26 Deprecated standard code conversion facets**

[depr.locale.stdcvf]

**D.26.1 General**

[depr.locale.stdcvf.general]

- <sup>1</sup> The header <codecvt> provides code conversion facets for various character encodings.

**D.26.2 Header <codecvt> synopsis**

[depr.codecvt.syn]

```
namespace std {
 enum codecvt_mode {
 consume_header = 4,
 generate_header = 2,
 little_endian = 1
 };

 template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
 class codecvt_utf8 : public codecvt<Elem, char, mbstate_t> {
 public:
 explicit codecvt_utf8(size_t refs = 0);
 ~codecvt_utf8();
 };

 template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
 class codecvt_utf16 : public codecvt<Elem, char, mbstate_t> {
 public:
 explicit codecvt_utf16(size_t refs = 0);
 ~codecvt_utf16();
 };
}
```

```

template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
class codecvt_utf8_utf16 : public codecvt<Elem, char, mbstate_t> {
public:
 explicit codecvt_utf8_utf16(size_t refs = 0);
 ~codecvt_utf8_utf16();
};
}

```

### D.26.3 Requirements

[depr.locale.stdcvt.req]

- <sup>1</sup> For each of the three code conversion facets `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:
  - (1.1) — `Elem` is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.
  - (1.2) — `Maxcode` is the largest wide-character code that the facet will read or write without reporting a conversion error.
  - (1.3) — If (`Mode & consume_header`), the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.
  - (1.4) — If (`Mode & generate_header`), the facet shall generate an initial header sequence when writing a multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.
  - (1.5) — If (`Mode & little_endian`), the facet shall generate a multibyte sequence in little-endian order, as opposed to the default big-endian order.
  - (1.6) — UCS-2 is the same encoding as UTF-16, except that it encodes scalar values in the range U+0000–U+FFFF (Basic Multilingual Plane) only.
- <sup>2</sup> For the facet `codecvt_utf8`:
  - (2.1) — The facet shall convert between UTF-8 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`).
  - (2.2) — Endianness shall not affect how multibyte sequences are read or written.
  - (2.3) — The multibyte sequences may be written as either a text or a binary file.
- <sup>3</sup> For the facet `codecvt_utf16`:
  - (3.1) — The facet shall convert between UTF-16 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`).
  - (3.2) — Multibyte sequences shall be read or written according to the `Mode` flag, as set out above.
  - (3.3) — The multibyte sequences may be written only as a binary file. Attempting to write to a text file produces undefined behavior.
- <sup>4</sup> For the facet `codecvt_utf8_utf16`:
  - (4.1) — The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes) within the program.
  - (4.2) — Endianness shall not affect how multibyte sequences are read or written.
  - (4.3) — The multibyte sequences may be written as either a text or a binary file.

## D.27 Deprecated convenience conversion interfaces

[depr.conversions]

### D.27.1 General

[depr.conversions.general]

- <sup>1</sup> The header `<locale>` (30.2) has the following additions:

```

namespace std {
 template<class Codecvt, class Elem = wchar_t,
 class WideAlloc = allocator<Elem>,
 class ByteAlloc = allocator<char>>
 class wstring_convert;

 template<class Codecvt, class Elem = wchar_t,
 class Tr = char_traits<Elem>>
 class wbuffer_convert;
}

```

### D.27.2 Class template `wstring_convert`

[`depr.conversions.string`]

- <sup>1</sup> Class template `wstring_convert` performs conversions between a wide string and a byte string. It lets you specify a code conversion facet (like class template `codecvt`) to perform the conversions, without affecting any streams or locales.

[Example 1: If you want to use the code conversion facet `codecvt_utf8` to output to `cout` a UTF-8 multibyte sequence corresponding to a wide string, but you don't want to alter the locale for `cout`, you can write something like:

```
std::wstring_convert<std::codecvt_utf8<wchar_t>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;

— end example]

namespace std {
 template<class Codecvt, class Elem = wchar_t,
 class WideAlloc = allocator<Elem>,
 class ByteAlloc = allocator<char>>
 class wstring_convert {
public:
 using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;
 using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
 using state_type = typename Codecvt::state_type;
 using int_type = typename wide_string::traits_type::int_type;

 wstring_convert() : wstring_convert(new Codecvt) {}
 explicit wstring_convert(Codecvt* pcvt);
 wstring_convert(Codecvt* pcvt, state_type state);
 explicit wstring_convert(const byte_string& byte_err,
 const wide_string& wide_err = wide_string());
 ~wstring_convert();

 wstring_convert(const wstring_convert&) = delete;
 wstring_convert& operator=(const wstring_convert&) = delete;

 wide_string from_bytes(char byte);
 wide_string from_bytes(const char* ptr);
 wide_string from_bytes(const byte_string& str);
 wide_string from_bytes(const char* first, const char* last);

 byte_string to_bytes(Elem wchar);
 byte_string to_bytes(const Elem* wptr);
 byte_string to_bytes(const wide_string& wstr);
 byte_string to_bytes(const Elem* first, const Elem* last);

 size_t converted() const noexcept;
 state_type state() const;

private:
 byte_string byte_err_string; // exposition only
 wide_string wide_err_string; // exposition only
 Codecvt* cvtptr; // exposition only
 state_type cvtstate; // exposition only
 size_t cvtcount; // exposition only
 };
}
```

- <sup>2</sup> The class template describes an object that controls conversions between wide string objects of class `basic_string<Elem, char_traits<Elem>, WideAlloc>` and byte string objects of class `basic_string<char, char_traits<char>, ByteAlloc>`. The class template defines the types `wide_string` and `byte_string` as synonyms for these two types. Conversion between a sequence of `Elem` values (stored in a `wide_string` object) and multibyte sequences (stored in a `byte_string` object) is performed by an object of class `Codecvt`, which meets the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`.

- <sup>3</sup> An object of this class template stores:

- (3.1) — `byte_err_string` — a byte string to display on errors

- (3.2) — `wide_err_string` — a wide string to display on errors
- (3.3) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wstring_convert` object is destroyed)
- (3.4) — `cvtstate` — a conversion state object
- (3.5) — `cvtcount` — a conversion count

```
size_t converted() const noexcept;
```

4     *Returns:* `cvtcount`.

```
wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);
```

5     *Effects:* The first member function converts the single-element sequence `byte` to a wide string. The second member function converts the null-terminated sequence beginning at `ptr` to a wide string. The third member function converts the sequence stored in `str` to a wide string. The fourth member function converts the sequence defined by the range `[first, last)` to a wide string.

6     In all cases:

- (6.1) — If the `cvtstate` object was not constructed with an explicit value, it is set to its default value (the initial conversion state) before the conversion begins. Otherwise it is left unchanged.
- (6.2) — The number of input elements successfully converted is stored in `cvtcount`.

7     *Returns:* If no conversion error occurs, the member function returns the converted wide string. Otherwise, if the object was constructed with a wide-error string, the member function returns the wide-error string. Otherwise, the member function throws an object of class `range_error`.

```
state_type state() const;
```

8     *Returns:* `cvtstate`.

```
byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);
```

9     *Effects:* The first member function converts the single-element sequence `wchar` to a byte string. The second member function converts the null-terminated sequence beginning at `wptr` to a byte string. The third member function converts the sequence stored in `wstr` to a byte string. The fourth member function converts the sequence defined by the range `[first, last)` to a byte string.

10    In all cases:

- (10.1) — If the `cvtstate` object was not constructed with an explicit value, it is set to its default value (the initial conversion state) before the conversion begins. Otherwise it is left unchanged.
- (10.2) — The number of input elements successfully converted is stored in `cvtcount`.

11    *Returns:* If no conversion error occurs, the member function returns the converted byte string. Otherwise, if the object was constructed with a byte-error string, the member function returns the byte-error string. Otherwise, the member function throws an object of class `range_error`.

```
explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,
const wide_string& wide_err = wide_string());
```

12    *Preconditions:* For the first and second constructors, `pcvt` is not null.

13    *Effects:* The first constructor stores `pcvt` in `cvtptr` and default values in `cvtstate`, `byte_err_string`, and `wide_err_string`. The second constructor stores `pcvt` in `cvtptr`, `state` in `cvtstate`, and default values in `byte_err_string` and `wide_err_string`; moreover the stored state is retained between calls to `from_bytes` and `to_bytes`. The third constructor stores `new Codecvt` in `cvtptr`, `state_type()` in `cvtstate`, `byte_err` in `byte_err_string`, and `wide_err` in `wide_err_string`.

```
~wstring_convert();
14 Effects: delete cvtptr.
```

### D.27.3 Class template wbuffer\_convert

[depr.conversions.buffer]

- <sup>1</sup> Class template `wbuffer_convert` looks like a wide stream buffer, but performs all its I/O through an underlying byte stream buffer that you specify when you construct it. Like class template `wstring_convert`, it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

```
namespace std {
 template<class Codecvt, class Elem = wchar_t, class Tr = char_traits<Elem>>
 class wbuffer_convert : public basic_streambuf<Elem, Tr> {
 public:
 using state_type = typename Codecvt::state_type;

 wbuffer_convert() : wbuffer_convert(nullptr) {}
 explicit wbuffer_convert(streambuf* bytebuf,
 Codecvt* pcvt = new Codecvt,
 state_type state = state_type());
 ~wbuffer_convert();

 wbuffer_convert(const wbuffer_convert&) = delete;
 wbuffer_convert& operator=(const wbuffer_convert&) = delete;

 streambuf* rdbuf() const;
 streambuf* rdbuf(streambuf* bytebuf);

 state_type state() const;

 private:
 streambuf* bufptr; // exposition only
 Codecvt* cvtptr; // exposition only
 state_type cvtstate; // exposition only
 };
}
```

- <sup>2</sup> The class template describes a stream buffer that controls the transmission of elements of type `Elem`, whose character traits are described by the class `Tr`, to and from a byte stream buffer of type `streambuf`. Conversion between a sequence of `Elem` values and multibyte sequences is performed by an object of class `Codecvt`, which shall meet the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`.

- <sup>3</sup> An object of this class template stores:

- (3.1) — `bufptr` — a pointer to its underlying byte stream buffer
- (3.2) — `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wbuffer_convert` object is destroyed)
- (3.3) — `cvtstate` — a conversion state object

`state_type state() const;`

<sup>4</sup> Returns: `cvtstate`.

`streambuf* rdbuf() const;`

<sup>5</sup> Returns: `bufptr`.

`streambuf* rdbuf(streambuf* bytebuf);`

<sup>6</sup> Effects: Stores `bytebuf` in `bufptr`.

<sup>7</sup> Returns: The previous value of `bufptr`.

```
explicit wbuffer_convert(
 streambuf* bytebuf,
 Codecvt* pcvt = new Codecvt,
```

```

state_type state = state_type();
8 Preconditions: pcvt is not null.
9 Effects: The constructor constructs a stream buffer object, initializes bufptr to bytbuf, initializes cvtptr to pcvt, and initializes cvtstate to state.
~wbuffer_convert();
10 Effects: delete cvtptr.

```

**D.28 Deprecated locale category facets**

[depr.locale.category]

- <sup>1</sup> The ctype locale category includes the following facets as if they were specified in table [Table 104 of 30.3.1.2.1](#).

```

codecvt<char16_t, char, mbstate_t>
codecvt<char32_t, char, mbstate_t>

```

- <sup>2</sup> The ctype locale category includes the following facets as if they were specified in table [Table 105 of 30.3.1.2.1](#).

```

codecvt_byname<char16_t, char, mbstate_t>
codecvt_byname<char32_t, char, mbstate_t>

```

- <sup>3</sup> The following class template specializations are required in addition to those specified in [30.4.2.5](#). The specialization `codecvt<char16_t, char, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms.

**D.29 Deprecated filesystem path factory functions**

[depr.fs.path.factory]

- <sup>1</sup> The header `<filesystem>` ([31.12.4](#)) has the following additions:

```

template<class Source>
path u8path(const Source& source);
template<class InputIterator>
path u8path(InputIterator first, InputIterator last);

```

- <sup>2</sup> *Mandates:* The value type of Source and InputIterator is `char` or `char8_t`.

- <sup>3</sup> *Preconditions:* The source and [first, last) sequences are UTF-8 encoded. Source meets the requirements specified in [31.12.6.4](#).

- <sup>4</sup> *Returns:*

- (4.1) — If `path::value_type` is `char` and the current native narrow encoding ([31.12.6.3.2](#)) is UTF-8, return `path(source)` or `path(first, last)`; otherwise,
- (4.2) — if `path::value_type` is `wchar_t` and the native wide encoding is UTF-16, or if `path::value_type` is `char16_t` or `char32_t`, convert `source` or [first, last) to a temporary, `tmp`, of type `path::string_type` and return `path(tmp)`; otherwise,
- (4.3) — convert `source` or [first, last) to a temporary, `tmp`, of type `u32string` and return `path(tmp)`.

- <sup>5</sup> *Remarks:* Argument format conversion ([31.12.6.3.1](#)) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

- <sup>6</sup> [*Example 1:* A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

```

namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));

```

For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs. — *end example*

[*Note 1:* The example above is representative of a historical use of `filesystem::u8path`. To indicate a UTF-8 encoding, passing a `std::u8string` to `path`'s constructor is preferred as it is consistent with `path`'s handling of other encodings. — *end note*]

## D.30 Deprecated atomic operations

[depr.atomics]

### D.30.1 General

[depr.atomics.general]

- <sup>1</sup> The header <atomic> (33.5.2) has the following additions.

```
namespace std {
 template<class T>
 void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
 template<class T>
 void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;

#define ATOMIC_VAR_INIT(value) see below
}
```

### D.30.2 Volatile access

[depr.atomics.volatile]

- <sup>1</sup> If an atomic (33.5.8) specialization has one of the following overloads, then that overload participates in overload resolution even if atomic<T>::is\_always\_lock\_free is false:

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator=(T desired) volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
operator T() const volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator op=(T operand) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
```

### D.30.3 Non-member functions

[depr.atomics.nonmembers]

```
template<class T>
void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
```

- <sup>1</sup> Effects: Equivalent to: atomic\_store\_explicit(object, desired, memory\_order::relaxed);

### D.30.4 Operations on atomic types

[depr.atomics.types.operations]

```
#define ATOMIC_VAR_INIT(value) see below
```

- <sup>1</sup> The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with value.

[Note 1: This operation possibly needs to initialize locks. — end note]

Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

[Example 1:

```
atomic<int> v = ATOMIC_VAR_INIT(5);
— end example]
```

# Annex E (informative)

## Conformance with UAX #31 [uaxid]

### E.1 General

[uaxid.general]

- <sup>1</sup> This Annex describes the choices made in application of UAX #31 (“Unicode Identifier and Pattern Syntax”) to C++ in terms of the requirements from UAX #31 and how they do or do not apply to C++. In terms of UAX #31, C++ conforms by meeting the requirements R1 “Default Identifiers” and R4 “Equivalent Normalized Identifiers”. The other requirements, also listed below, are either alternatives not taken or do not apply to C++.

### E.2 R1 Default identifiers

[uaxid.def]

#### E.2.1 General

[uaxid.def.general]

- <sup>1</sup> UAX #31 specifies a default syntax for identifiers based on properties from the Unicode Character Database, UAX #44. The general syntax is

```
<Identifier> := <Start> <Continue>* (<Medial> <Continue>+)*
```

where `<Start>` has the XID\_Start property, `<Continue>` has the XID\_Continue property, and `<Medial>` is a list of characters permitted between continue characters. For C++ we add the character U+005F LOW LINE, or `_`, to the set of permitted `<Start>` characters, the `<Medial>` set is empty, and the `<Continue>` characters are unmodified. In the grammar used in UAX #31, this is

```
<Identifier> := <Start> <Continue>*
<Start> := XID_Start + U+005F
<Continue> := <Start> + XID_Continue
```

- <sup>2</sup> This is described in the C++ grammar in 5.10, where *identifier* is formed from *identifier-start* or *identifier* followed by *identifier-continue*.

#### E.2.2 R1a Restricted format characters

[uaxid.def.rfmt]

- <sup>1</sup> If an implementation of UAX #31 wishes to allow format characters such as U+200D ZERO WIDTH JOINER or U+200C ZERO WIDTH NON-JOINER it must define a profile allowing them, or describe precisely which combinations are permitted.
- <sup>2</sup> C++ does not allow format characters in identifiers, so this does not apply.

#### E.2.3 R1b Stable identifiers

[uaxid.def.stable]

- <sup>1</sup> An implementation of UAX #31 may choose to guarantee that identifiers are stable across versions of the Unicode Standard. Once a string qualifies as an identifier it does so in all future versions.
- <sup>2</sup> C++ does not make this guarantee, except to the extent that UAX #31 guarantees the stability of the XID\_Start and XID\_Continue properties.

### E.3 R2 Immutable identifiers

[uaxid.immutable]

- <sup>1</sup> An implementation may choose to guarantee that the set of identifiers will never change by fixing the set of code points allowed in identifiers forever.
- <sup>2</sup> C++ does not choose to make this guarantee. As scripts are added to Unicode, additional characters in those scripts may become available for use in identifiers.

### E.4 R3 PatternWhiteSpace and PatternSyntax characters

[uaxid.pattern]

- <sup>1</sup> UAX #31 describes how formal languages such as computer languages should describe and implement their use of whitespace and syntactically significant characters during the processes of lexing and parsing.
- <sup>2</sup> C++ does not claim conformance with this requirement.

**E.5 R4 Equivalent normalized identifiers**

[uaxid.eqn]

- <sup>1</sup> UAX #31 requires that implementations describe how identifiers are compared and considered equivalent.
- <sup>2</sup> C++ requires that identifiers be in Normalization Form C and therefore identifiers that compare the same under NFC are equivalent. This is described in 5.10.

**E.6 R5 Equivalent case-insensitive identifiers**

[uaxid.eqci]

- <sup>1</sup> C++ considers case to be significant in identifier comparison, and does not do any case folding. This requirement does not apply to C++.

**E.7 R6 Filtered normalized identifiers**

[uaxid.filter]

- <sup>1</sup> If any characters are excluded from normalization, UAX #31 requires a precise specification of those exclusions.
- <sup>2</sup> C++ does not make any such exclusions.

**E.8 R7 Filtered case-insensitive identifiers**

[uaxid.filterci]

- <sup>1</sup> C++ identifiers are case sensitive, and therefore this requirement does not apply.

**E.9 R8 Hashtag identifiers**

[uaxid.hashtag]

- <sup>1</sup> There are no hashtags in C++, so this requirement does not apply.

**void\***  
 type, 81  
**void&**, 201  
**volatile**, 81  
 constructor and, 280  
 destructor and, 286  
 implementation-defined, 186  
 keyword, 21, 81, 82, 84, 89, 126, 195, 1940,  
     1979  
 volatile object, *see* object, volatile  
 volatile-qualified, 81  
**W**  
 waiting function, *see* function, waiting  
**wchar\_t**, *see* type, **wchar\_t**  
 keyword, 3, 21, 24, 27, 78, 82, 101, 102, 104,  
     137, 186, 187, 214, 220, 480, 481, 487,  
     513, 514, 693, 822, 833, 887, 1506, 1601,  
     1623, 1645, 1648, 1724, 1742, 1749, 1751,  
     1752, 1790, 1792, 1851, 1859, 1939, 1961,  
     1973, 1981, 2000, 2004  
 weakly parallel forward progress guarantees, 90  
 well-formed program, *see* program, well-formed  
**while**  
 keyword, 21, 157, 164, 165, 168, 169, 1936  
 whitespace, 17, 18  
 wide literal encoding, *see* encoding, wide literal  
 wide-character, 24  
 null, 16  
 wide-character set  
 execution, 487  
 width, 77, 293  
 of integer-class type, 1097  
 padding, 814  
 worse conversion sequence, *see* conversion  
     sequence, worse  
**X**  
**xor**  
 keyword, 18, 21, 1928, 1981  
**xor\_eq**  
 keyword, 18, 21, 1928, 1981  
**xvalue**, 96  
**Y**  
 $Y_\ell^m$  (spherical associated Legendre functions),  
     1504  
**yield-expression**, 153, 1935  
**Z**  
**zero**  
 division by undefined, 95  
 remainder undefined, 95  
 undefined division by, 146  
 zero-initialization, 212  
 zeta functions  $\zeta$ , 1504

# Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary (Annex A). Other page numbers refer to pages where the grammar production is mentioned in the general text.

- abstract-declarator*, 194, **196**, 196, 197, 205, 208, 209, **1940**
- abstract-pack-declarator*, **196**, **1940**
- access-specifier*, **299**, 299, 309, 310, **1944**
- additive-expression*, **146**, **1934**
- alias-declaration*, 33, 42, **175**, 181, 196, 206, 262, 265, 275, 367, 387, 406, **1937**
- alignment-specifier*, 72, **251**, 252, 253, 392, 393, **1942**, 1979
- and-expression*, **150**, **1935**
- asm-declaration*, 157, 176, **248**, 248, **1942**
- assignment-expression*, 123, **154**, 176, 192, 193, 209, 216, 219, 234, 293, 317, 340, **1935**
- assignment-operator*, **154**, **1935**
- attribute*, **251**, 252, 392, **1942**
- attribute-argument-clause*, **251**, 251–258, **1943**
- attribute-declaration*, 33, **175**, 177, **1937**
- attribute-list*, **251**, 251, 252, 392, **1942**
- attribute-namespace*, **251**, 251, 252, **1943**
- attribute-scoped-token*, **251**, 251, 252, **1943**
- attribute-specifier*, **251**, 251, 252, **1942**, 1979
- attribute-specifier-seq*, 43, 109, 111, 139, 164, 165, 168, 176, 178, 181, 185, 188, 198–200, 202–204, 228, 235, 236, 239–241, 248, **251**, 252, 256, 259, 263, 270, 276, 280, 286, 290, 293, 299, 407, 427, 455, **1942**
- attribute-token*, 20, **251**, 251–258, 467, 506, **1943**
- attribute-using-prefix*, **251**, 251, **1942**
- await-expression*, 85, **135**, 135, 136, 157, 231, 232, 559, **1934**
- balanced-token*, **251**, **1943**
- balanced-token-seq*, **248**, **251**, 252, **1943**
- base-clause*, **271**, **299**, 422, **1944**
- base-specifier*, 46, 54, **299**, 299, 300, 308, 312, 392, **1944**
- base-specifier-list*, **285**, **299**, 300, 308, 320, 322, 329, 342, 392, 394, **1944**
- basic-c-char*, **24**, 25, **1929**
- basic-s-char*, **27**, 28, **1930**
- binary-digit*, **22**, 22, **1928**
- binary-exponent-part*, **26**, 26, **1930**
- binary-literal*, **22**, 23, **1928**
- block-declaration*, 32, **175**, **1937**
- boolean-literal*, **29**, **1931**
- brace-or-equal-initializer*, 83, 192, **212**, 212, 213, 216, 275, 276, 281, 293, 416, **1940**
- braced-init-list*, 72, 83, 125, 139, 154, 163, 171, 192, **212**, 213, 215, 216, 218, 223, 224, 226,
- c-char*, **24**, 24, **1929**
- c-char-sequence*, 13, 16, **23**, 24, 25, **1929**
- capture*, **114**, 115, 392, **1932**
- capture-default*, 36, **114**, 115, 116, 118, **1932**, 1957, 1983
- capture-list*, **114**, 392, **1932**
- cast-expression*, 119, 135, 143, **144**, 144, 145, 163, 294, 361, 392, 393, 418, **1934**
- character-literal*, 16, **23**, 24, 25, 467, 472, 474, 1607, **1929**, 1966, 1973
- class-head*, 42, 252, **270**, 270, **1943**
- class-head-name*, 44, 108, **270**, 270, 271, **1943**
- class-key*, 57, 176, 188, **270**, 270–272, 296, 310, 388, **1944**
- class-name*, 12, 45, 176, 181, 188, **270**, 270, 273, 274, 286, **1943**
- class-or-decltype*, 53, 271, **299**, 299, 318, 342, 409, **1944**
- class-specifier*, 32, 42, 44, 46, 60, 176, 185, **270**, 270, 276, 279, **1943**
- class-virt-specifier*, **270**, 271, 667, **1943**
- compare-expression*, **148**, **1935**
- compound-requirement*, **121**, 122, **1933**
- compound-statement*, 43, 44, 83, 91, 107, 108, 114, 118, 135, 161, 164, **165**, 165, 167, 168, 171, 281, 319, 320, 326, 425, 455–458, 460, **1936**
- concept-definition*, 33, 42, **407**, 407, **1946**
- concept-name*, 42, 60, 264, 369, 375, **407**, 407, **1946**
- condition*, 32, **164**, 164, 166–169, 213, 456, **1936**
- conditional-escape-sequence*, **24**, 25, 29, **1930**
- conditional-escape-sequence-char*, **24**, **1930**
- conditional-expression*, 4, **151**, 152, 157, 158, 177, **1935**
- conditionally-supported-directive*, **464**, 465, 472, **1947**
- constant-expression*, 3, 84, 139, **155**, 155, 162, 167, 177, 180, 203, 236, 252, 275, 293, 334, 460, 484, **1935**
- constraint-expression*, 42, 106, 122, **195**, 368, 369, 375, 381, **383**, 383, 384, 402, 407, 410, 484, **1946**
- constraint-logical-and-expression*, **367**, **1945**
- constraint-logical-or-expression*, 195, **367**, 368, **1945**
- control-line*, **464**, 470, **1947**

*conversion-declarator*, 290, 1944  
*conversion-function-id*, 32, 46, 48, 106, 190, 290, 290, 291, 334, 372, 413, 415, 416, 444, 1944, 1958  
*conversion-type-id*, 48, 290, 290, 291, 336, 409, 413, 415, 444, 1944  
*coroutine-return-statement*, 171, 231, 1936  
*ctor-initializer*, 108, 227, 228, 281, 318, 318, 319, 321, 456, 457, 1945  
*cv-qualifier*, 81, 82, 144, 153, 176, 178, 185, 195, 200, 202, 205, 234, 276, 279, 363, 370, 459, 488, 1940  
*cv-qualifier-seq*, 105, 129, 146, 185, 195, 200, 202–206, 228, 290, 336, 1940  
  
*d-char*, 17, 27, 1931  
*d-char-sequence*, 27, 27, 1930, 1931  
*decimal-floating-point-literal*, 25, 26, 1930  
*decimal-literal*, 22, 23, 1928  
*decl-specifier*, 164, 170, 176, 178, 178, 180, 188, 190, 193, 194, 280, 286, 290, 409, 1938, 1958  
*decl-specifier-seq*, 81, 164, 170, 176, 178, 178–180, 185, 190, 193, 194, 199, 228, 234, 236, 276, 280, 286, 290, 313, 409, 1938  
*declaration*, 33, 172–174, 175, 181, 185, 196, 198, 239, 263, 265, 275, 312, 367, 368, 406, 427–429, 1937  
*declaration-seq*, 12, 33, 175, 261, 263–265, 267, 419, 1937  
*declaration-statement*, 135, 172, 172, 1936  
*declarator*, 32, 33, 43, 49, 81, 105, 164, 173, 174, 176, 180, 190, 194, 195, 196, 198, 199, 209, 228, 275, 280, 286, 290, 409, 427, 1939  
*declarator-id*, 43, 44, 49, 54, 106, 108, 115, 176, 196, 197–200, 202–204, 207, 208, 234, 254, 260, 275, 286, 290, 329, 359, 365, 368, 373, 409, 441, 445, 449, 452, 1940, 1958  
*decltype-specifier*, 52, 72, 97, 106, 108, 113, 135, 187, 189, 189, 201, 265, 287, 386, 446, 1939  
*deduction-guide*, 33, 44, 176, 274, 341, 343, 344, 348, 367, 388, 389, 1946  
*defined-macro-expression*, 466, 466, 467, 1948  
*defining-type-id*, 59, 181, 187, 196, 342, 343, 406, 409, 1940  
*defining-type-specifier*, 60, 176, 178, 180, 184, 185, 290, 1938  
*defining-type-specifier-seq*, 181, 185, 185, 1938  
*delete-expression*, 35, 65, 69, 140, 142, 142–144, 157, 287, 294, 295, 533, 534, 1934  
*designated-initializer-clause*, 212, 213, 216, 223, 458, 1941  
*designated-initializer-list*, 212, 215, 216, 223–225, 341, 352, 1941  
*designator*, 212, 215, 216, 224, 1941  
*digit*, 19, 22, 26, 259, 469, 504, 1927, 1965

*digit-sequence*, 26, 26, 1930  
*directory-separator*, 1749, 1749–1751, 1755, 1756, 1759, 1760  
  
*elaborated-type-specifier*, 32–34, 39, 42, 53, 54, 57, 176, 181, 188, 188, 252, 260, 270, 273, 274, 395, 409, 411, 427, 1939  
*elif-group*, 464, 1947  
*elif-groups*, 464, 1947  
*else-group*, 464, 1947  
*empty-declaration*, 33, 175, 177, 275, 1937  
*enclosing-namespace-specifier*, 239, 240, 1942  
*encoding-prefix*, 14, 16, 23, 24, 25, 28, 29, 365, 1929, 1951, 1952, 1973  
*endif-line*, 464, 1947  
*enum-base*, 235, 236, 237, 1941  
*enum-head*, 42, 235, 235, 1941  
*enum-head-name*, 44, 108, 235, 236, 1941  
*enum-key*, 235, 236, 1941  
*enum-name*, 176, 188, 235, 235, 1941  
*enum-specifier*, 32, 42, 44, 176, 185, 235, 236–238, 275, 276, 1941  
*enumerator*, 176, 235, 236, 1941  
*enumerator-definition*, 32, 42, 235, 236, 1941  
*enumerator-list*, 44, 235, 236, 237, 422, 1941  
*equality-expression*, 149, 1935  
*escape-sequence*, 24, 1929  
*exception-declaration*, 32, 37, 252, 326, 455, 455, 457–460, 1946  
*exclusive-or-expression*, 151, 1935  
*explicit-instantiation*, 177, 179, 198, 427, 428, 1946  
*explicit-specialization*, 177, 188, 198, 429, 429, 1946  
*explicit-specifier*, 180, 180, 199, 280, 334, 343, 344, 438, 1938  
*exponent-part*, 26, 26, 1930  
*export-declaration*, 238, 260, 261, 263, 368, 429, 1943  
*export-keyword*, 17, 20, 259, 260, 470, 1928  
*expr-or-braced-init-list*, 171, 212, 1941  
*expression*, 21, 73, 98, 121, 122, 124, 129, 139, 155, 164, 167, 169, 171, 192, 326, 382, 384, 386, 416–418, 446, 484, 676, 1935  
*expression-list*, 74, 83, 123, 123–126, 141, 192, 193, 213–215, 317, 319, 321, 335, 340, 341, 394, 413, 1933  
*expression-statement*, 165, 172, 1936  
  
*fallback-separator*, 1749  
*filename*, 1746, 1749, 1749, 1757, 1759, 1760  
*floating-point-literal*, 18, 19, 25, 26, 1527, 1930  
*floating-point-suffix*, 26, 26, 1930  
*fold-expression*, 119, 392, 393, 417, 1933  
*fold-operator*, 119, 119, 393, 1933  
*for-range-declaration*, 32, 42, 168, 168, 170, 1936  
*for-range-initializer*, 42, 74, 168, 169, 170, 223, 1936, 1952  
*fractional-constant*, 25, 26, 1930

*function-body*, 33, 42, 43, 60, 114, 135, 171, **228**, 228–232, 328, 458, **1941**

# Index of library concepts

The bold page number for each entry is the page where the concept is defined. Other page numbers refer to pages where the concept is mentioned in the general text. Concepts whose name appears in *italics* are for exposition only.

- advanceable*, 1174, **1175**, 1175–1179
- all-bidirectional*, **1244**, 1244–1246
- all-forward*, **1244**, 1244–1246
- all-random-access*, **1244**, 1245–1247, 1289, 1292
- assignable\_from*, **565**, **568**, 568, 569, 574, 899, 1099, 1108, 1109, 1112, 1115, 1127, 1130–1132, 1135, 1137, 1314
- bidirectional-common*, **1213**, 1215, 1216, **1218**
- bidirectional\_iterator*, **1083**, 1085, 1089, 1101, 1101, 1112–1114, 1122–1124, 1127, 1135, 1138, 1158, 1159, 1163, 1167, 1169, 1300, 1314, 1316, 1317, 1323, 1324, 1331, 1333, 1342, 1359, 1362, 1363, 1373, 1377, 1385, 1386, 1389, 1402, 1403, 1812, 1814
- bidirectional\_range*, **1153**, **1163**, 1163, 1165, 1166, 1192, 1193, 1196–1198, 1210, **1212**, 1213, 1215, 1216, 1218, 1230, 1234–1236, 1239–1241, 1243, 1244, 1250, 1252, 1255, 1256, 1261, 1262, 1269–1271, 1273, 1275, 1276, 1279–1285, 1287, 1314, 1316, 1317, 1323, 1324, 1331, 1333, 1342, 1359, 1362, 1363, 1373, 1386, 1389, 1402, 1403
- boolean-testable*, 485, 494, 497, 551, 553, 554, **571**, **572**, 572, 573, 575, 698, 712, 1103, 1106, 1300, 1825
- boolean-testable-impl*, **571**, 571, 572
- borrowed\_range*, **1051**, **1161**, 1161, 1167–1170, 1640, 1720, 1721
- can-reference*, **1081**, 1081, 1082, 1092, 1099, 1133, 1152, 1155, 1194, 1196, 1199, **1249**, 1250, 1252, 1259, 1260, 1263
- cartesian-is-sized-sentinel*, **1287**, 1290, 1293
- cartesian-product-common-arg*, **1287**, 1287
- cartesian-product-is-bidirectional*, **1287**, 1289–1292
- cartesian-product-is-common*, **1287**, 1288
- cartesian-product-is-random-access*, **1287**, 1289, 1290, 1292
- cartesian-product-is-sized*, **1287**, 1288, 1289
- common\_range*, **1153**, **1163**, 1163, 1165, 1166, 1171, 1190, 1191, 1195, 1196, 1208, 1210, 1212–1214, 1216, 1220, 1226, 1228–1231, 1233, 1238, 1243, 1246, 1249, 1254, 1260, 1269, 1273, 1274, 1279, 1282, 1287
- common\_reference\_with*, **565**, **567**, 567–569, 1069, 1096, 1107, 1213, 1294, 1953
- common\_with*, **565**, **567**, 568, 1086, 1136, 1138, 1139, 1213
- compares-as*, **551**, 551, **552**
- comparison-common-type-with*, **552**, **573**, 573
- comparison-common-type-with-impl*, **572**, 573
- compatible-joinable-ranges*, **1153**, **1213**, 1213, 1215, 1219
- const-formattable-range*, **811**, 811
- constant\_iterator*, **1086**, **1121**, 1121, 1158, 1159, 1164
- constant\_range*, **1154**, **1164**, 1164, 1231
- constructible\_from*, **565**, **570**, 570, 571, 600–602, 1069, 1093, 1108, 1109, 1133, 1164, 1166, 1171, 1173, 1181, 1214, 1220, 1221, 1225, 1226, 1295, 1296, 1314, 1315, 1359, 1360, 1419–1421, 1833
- container-compatible-range*, 860–862, 866, 871–873, 876, **889**, 896, 905, 914, 930–938, 941–944, 947–949, 951–953, 958, 959, 961, 964, 965, 967–969, 971–973, 975, 978, 979, 982, 986, 987, 990, 992, 993, 995, 997, 998, 1001, 1005–1008, 1010–1013, 1016, 1018, 1021, 1023, 1028, 1029, 1033, 1035, 1036, 1039, 1040, 1042, 1043, 1046
- contiguous\_iterator*, 850, 893, 1050, **1051**, 1053, 1083, 1089, **1102**, 1102, 1123, 1135–1137, 1160, 1163, 1165, 1228, 1492
- contiguous\_range*, **850**, **1051**, 1052, **1163**, 1163, 1188, 1189
- convertible-to-non-slicing*, **1166**, 1166–1168
- convertible\_to*, **120**, 407, 485, 564, **567**, 567, 571, 572, 776, 818, **889**, 1054, 1055, 1075–1079, 1093, 1115, 1121, 1123, 1127, 1130–1132, 1135, 1136, 1166–1168, **1171**, 1175, 1189, 1196, 1197, 1199, 1200, 1202–1205, 1209, 1211–1213, 1215, 1217, 1219, 1221, 1222, 1228, 1234, 1235, 1237, 1239, 1240, 1242, 1244, 1245, 1247, 1248, 1250, 1251, 1253, 1255, 1256, 1258, 1259, 1261–1264, 1270, 1271, 1275, 1276, 1283, 1284, 1289, 1291, 1296, 1297, 1314, 1343–1345, 1720, 1721
- copy\_constructible*, **565**, **571**, 571, 574, **723**, 1107, 1162, 1173, 1181, 1186, 1187, 1190, 1191, 1195, 1201, 1203, 1205, 1207, 1208, 1214, 1220, 1226, 1229–1231, **1233**, **1239**,

# Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

## #pragma, 477

additional execution policies supported by parallel algorithms, 806, 1303

additional `file_type` enumerators for file systems supporting additional types of file, 1763

additional formats for `time_get::do_get_date`, 1627

additional supported forms of preprocessing directive, 465

algorithms for producing the standard random number distributions, 1452

alignment, 71

alignment additional values, 71

alignment of bit-fields within a class object, 293

allocation of bit-fields within a class object, 293

any use of an invalid pointer other than to perform indirection or deallocate, 68

argument values to construct

`ios_base::failure`, 1662

assignability of placeholder objects, 788

barrier phrase completion without `wait`, 1904

behavior of iostream classes when

`traits::pos_type` is not `streampos` or  
    when `traits::off_type` is not  
    `streamoff`, 1645

behavior of non-standard attributes, 252

behavior of `strstreambuf::setbuf`, 1991

bits in a byte, 61

character encoding scheme of the environment, 1639

choice of larger or smaller value of  
*floating-point-literal*, 26

code unit sequence for *conditional-escape-sequence*, 29

column value of `source_location::current`, 540

conversions between pointers and integers, 132

converting function pointer to object pointer and vice versa, 132

default configuration of a pool, 650

default `next_buffer_size` for a  
    `monotonic_buffer_resource`, 651

default number of buckets in `unordered_map`, 982, 983

default number of buckets in  
    `unordered_multimap`, 990

default number of buckets in

`unordered_multiset`, 1000, 1001

default number of buckets in `unordered_set`, 995

default value for `least_max_value` template parameter of `counting_semaphore`, 1900

defining `main` in freestanding environment, 91

definition and meaning of `__STDC__`, 480, 1981

definition and meaning of `__STDC_VERSION__`, 480

definition of `NULL`, 514, 1981

derived type for `typeid`, 128

determination of kind of input file, 13

diagnostic message, 4

dynamic initialization of static inline variables before `main`, 93

dynamic initialization of static variables before `main`, 92, 93

dynamic initialization of thread-local variables before entry, 93

effect of calling associated Laguerre polynomials with  $n \geq 128$  or  $m \geq 128$ , 1500

effect of calling associated Legendre polynomials with  $l \geq 128$ , 1500

effect of calling `basic_filebuf::setbuf` with nonzero arguments, 1729

effect of calling `basic_filebuf::sync` when a get area exists, 1730

effect of calling `basic_streambuf::setbuf` with nonzero arguments, 1707

effect of calling cylindrical Bessel functions of the first kind with  $nu \geq 128$ , 1501

effect of calling cylindrical Neumann functions with  $nu \geq 128$ , 1502

effect of calling Hermite polynomials with  $n \geq 128$ , 1503

effect of calling `ios_base::sync_with_stdio` after any input or output operation on standard streams, 1656

effect of calling irregular modified cylindrical Bessel functions with  $nu \geq 128$ , 1502

effect of calling Laguerre polynomials with  $n \geq 128$ , 1503

effect of calling Legendre polynomials with  $l \geq 128$ , 1503

effect of calling regular modified cylindrical Bessel functions with  $nu \geq 128$ , 1501

effect of calling spherical associated Legendre functions with  $l \geq 128$ , 1504

effect of calling spherical Bessel functions with `n >= 128`, 1504  
 effect of calling spherical Neumann functions with `n >= 128`, 1505  
 effect of *conditional-escape-sequence* on encoding state, 29  
 effect of `filesystem::copy`, 1775  
 effect on C locale of calling `locale::global`, 1604  
 encoding assumption for `format` width computation, 816  
`error_category` for errors originating outside the operating system, 511  
 exception type when `random_device` constructor fails, 1450  
 exception type when `random_device::operator()` fails, 1450  
 exception type when `shared_ptr` constructor fails, 626, 627  
 exceptions thrown by standard library functions that have a potentially-throwing exception specification, 511  
 exit status, 530  
 extended signed integer types, 77  
 file type of the file argument of `filesystem::status`, 1785  
 floating-point conversion subrank, 83  
 formatted character sequence generated by `time_put::do_put` in C locale, 1629  
 forward progress guarantees for implicit threads of parallel algorithms (if not defined for `thread`), 1302  
 growth factor for `monotonic_buffer_resource`, 651, 652  
 headers for freestanding implementation, 492  
 how `random_device::operator()` generates values, 1450  
 how `text_encoding` objects are determined to be representative of a character encoding scheme, 1638  
 how the set of importable headers is determined, 263  
 interactive device, 11  
 interpretation of the path character sequence with format `path::auto_format`, 1762  
 largest supported value to configure the largest allocation satisfied directly by a pool, 649  
 largest supported value to configure the maximum number of blocks to replenish a pool, 649  
 last enumerator of `launch`, 1905  
 linkage of `main`, 91  
 linkage of names from C standard library, 493  
 linkage of objects between C++ and other languages, 251  
 locale names, 1602  
 locales with Unicode support for chrono types, 1588  
 lvalue-to-rvalue conversion of an invalid pointer value, 100  
 manner of search for included source file, 469  
 mapping from name to catalog when calling `messages::do_open`, 1636  
 mapping header name to header or external source file, 19  
 mapping input source file characters to translation character set, 1963  
 mapping of pointer to integer, 131  
 mapping physical source file characters to translation character set, 13  
 mapping to message when calling `messages::do_get`, 1636  
 maximum depth of recursive template instantiations, 426  
 maximum size of an allocated object, 139, 536  
 meaning of `,`, `\`, `/*`, or `//` in a *q-char-sequence* or an *h-char-sequence*, 19  
 meaning of `asm` declaration, 248  
 meaning of attribute declaration, 177  
 meaning of dot-dot in *root-directory*, 1750  
 nesting limit for `#include` directives, 469  
 NTCTS in `basic_ostream<charT, traits>::operator<<(nullptr_t)`, 1692  
 number of placeholders for bind expressions, 772, 788  
 number of threads in a program under a freestanding implementation, 86  
 operating system on which implementation depends, 1742  
`operator<<` for large extended floating-point types, 1691  
`operator>>` for large extended floating-point types, 1679  
 ordinary and wide literal encodings, 16  
 parameters to `main`, 91  
 passing argument of class type through ellipsis, 125  
 presence and meaning of `native_handle_type` and `native_handle`, 1825  
 presence and value of `_STDC_ISO_10646_-`, 480  
 rank of extended signed integer type, 82  
 representation of floating-point types, 79  
 required alignment for `atomic_ref` type's operations, 1848, 1851–1853  
 resource limits on a message catalog, 1636  
 result of `filesystem::file_size`, 1780  
 result of inexact floating-point conversion, 102, 131  
 resuming a coroutine on a different execution agent, 557

return type of `cartesian_product_view::size`,  
     1289  
 return value of `bad_alloc::what`, 536  
 return value of `bad_any_cast::what`, 739  
 return value of `bad_array_new_length::what`,  
     536  
 return value of `bad_cast::what`, 539  
 return value of `bad_exception::what`, 542  
 return value of `bad_function_call::what`, 789  
 return value of `bad_optional_access::what`,  
     724  
 return value of `bad_typeid::what`, 539  
 return value of `bad_variant_access::what`, 738  
 return value of `bad_weak_ptr::what`, 624  
 return value of `char_traits<char16_t>::eof`,  
     845  
 return value of `char_traits<char32_t>::eof`,  
     845  
 return value of `char_traits<char8_t>::eof`,  
     844  
 return value of `exception::what`, 542  
 return value of `source_location::current`, 540  
 return value of `type_info::name()`, 538  
  
 search locations for "" header, 469  
 search locations for <> header, 468  
 semantics of an access through a volatile glvalue,  
     186  
 semantics of linkage specifiers, 249  
 semantics of parallel algorithms invoked with  
     implementation-defined execution  
     policies, 1303  
 semantics of  
     `stacktrace_entry::native_handle`,  
     592  
 semantics of `token` parameter and default token  
     value used by `random_device`  
     constructors, 1450  
 sequence of places searched for a header, 468  
 set of aliases of a known registered character  
     encoding, 1638  
 set of character types that iostreams templates  
     can be instantiated for, 1601, 1645  
 set of integer-class types, 1097  
 signedness of `char`, 188  
`sizeof` applied to fundamental types other than  
     `char`, `signed char`, and `unsigned`  
     `char`, 137  
 stack unwinding before invocation of  
     `std::terminate`, 459, 463  
`stacktrace_entry::native_handle_type`, 591  
 startup and termination in freestanding  
     environment, 91  
 strict total order over pointer values, 5  
 string resulting from `--func--`, 229  
 support for extended alignments, 71  
 support for *module-import-declarations* with  
     non-C++ language linkage, 249  
 supported input files, 13  
  
 supported multibyte character encoding rules, 844  
 supported *root-names* in addition to any operating  
     system dependent *root-names*, 1749, 1750  
  
 text of `--DATE--` when date of translation is not  
     available, 477  
 text of `--TIME--` when time of translation is not  
     available, 478  
 threads and program points at which deferred  
     dynamic initialization is performed, 92,  
     93  
 type of a directory-like file, 1769, 1771  
 type of `array::const_iterator`, 927  
 type of `array::iterator`, 927  
 type of `basic_stacktrace::const_iterator`,

 type of `unordered_multiset::size_type`, 997  
 type of `unordered_set::const_iterator`, 991  
 type of `unordered_set::const_local_-`  
     `iterator`, 991  
 type of `unordered_set::difference_type`, 991  
 type of `unordered_set::iterator`, 991  
 type of `unordered_set::local_iterator`, 991  
 type of `unordered_set::size_type`, 991  
 type of `vector::const_iterator`, 947  
 type of `vector::difference_type`, 947  
 type of `vector::iterator`, 947  
 type of `vector::size_type`, 947  
 type of `vector<bool>::const_iterator`, 952  
 type of `vector<bool>::const_pointer`, 952  
 type of `vector<bool>::difference_type`, 952  
 type of `vector<bool>::iterator`, 952  
 type of `vector<bool>::pointer`, 952  
 type of `vector<bool>::size_type`, 952  
 underlying type for enumeration, 237  
 underlying type of `bool`, 78  
 underlying type of `char`, 78  
 underlying type of `wchar_t`, 78  
 unit suffix when `Period::type` is `micro`, 1529  
 value of bit-field that cannot represent  
     assigned value, 154  
     incremented value, 127  
     initializer, 215  
 value of *conditional-escape-sequence*, 25  
 value of `ctype<char>::table_size`, 1609  
 value of `future_errc::broken_promise`, 1905  
 value of `future_errc::future_already_-`  
     `retrieved`, 1905  
 value of `future_errc::no_state`, 1905  
 value of `future_errc::promise_already_-`  
     `satisfied`, 1905  
 value of *has-attribute-expression* for non-standard  
     attributes, 467  
 value of *has-attribute-expression* for standard  
     attributes, 467  
 value of non-encodable character literal or  
     multicharacter literal, 25  
 value of `pow(0,0)`, 1430  
 value of result of inexact integer to floating-point  
     conversion, 102  
 value representation of pointer types, 81  
 values of a trivially copyable type, 76  
 values of various `ATOMIC_..._LOCK_FREE` macros,  
     1847  
 whether `<cfenv>` functions can be used to manage  
     floating-point status, 1424  
 whether a freestanding deleted function is a  
     freestanding item or a deleted function,  
     489  
 whether a given `atomic` type's operations are  
     always lock free, 1855, 1856, 1859, 1861,  
     1863, 1865, 1868  
 whether a given `atomic_ref` type's operations are  
     always lock free, 1848, 1851–1853  
 whether `basic_spanbuf`'s move source is empty  
     after a move, 1718  
 whether freestanding default replaceable global  
     allocation functions satisfy required  
     behavior, 532  
 whether functions from Annex K of the C  
     standard library are declared when C++  
     headers are included, 491

whether locale object is global or per-thread, 1600  
whether pragma FENV\_ACCESS is supported, 1424  
whether `rand` may introduce a data race, 1473  
whether sequence pointers are copied by  
    `basic_filebuf` move constructor, 1726  
whether sequence pointers are copied by  
    `basic_stringbuf` move constructor,  
        1703  
whether sequence pointers are initialized to null  
    pointers, 1702  
whether source file inclusion of importable header  
    is replaced with `import` directive, 469  
whether source of translation units must be  
    available to locate template definitions,  
        14  
whether stack is unwound before invoking the  
    function `std::terminate` when a  
    `noexcept` specification is violated, 463  
whether the implementation is hosted or  
    freestanding, 492  
whether the lifetime of a parameter ends when the  
    callee returns or at the end of the  
    enclosing full-expression, 124  
whether the sources for module units and header  
    units on which the current translation  
    unit has an interface dependency are  
    required to be available during  
    translation, 14  
whether the thread that executes `main` and the  
    threads created by `std::thread` or  
    `std::jthread` provide concurrent  
    forward progress guarantees, 90  
whether `time_get::do_get_year` accepts  
    two-digit year numbers, 1627  
whether values are rounded or truncated to the  
    required precision when converting  
    between `time_t` values and `time_point`  
    objects, 1533  
which functions in the C++ standard library may  
    be recursively reentered, 510  
which non-standard-layout objects containing no  
    data are considered empty, 63  
which scalar types have unique object  
    representations, 673  
width of integral type, 78
